RECENTLY we announced that a church in Dundee was likely to be converted into a motor garage—as have several similar buildings on the southern side of the Tweed. Now we are able to inform our readers that Messrs. Thomas Shaw (Dundee), Ltd., have purchased, subject to confirmation by the General Assembly of the U.F. Church and the Church Commission of 1905, St. David's U.F. Church, Dundee, for the purpose of converting it into a motor garage. The ground extends to forty-four poles, and when the necessary alterations have been made the premises will be one of the largest in Scotland devoted to the accommodation of the automobile. It is situated in Ward Road, near by the General Post Office.

## THE A.C.G.B.I. SPEEDOMETER AND TYRE TESTING APPARATUS.

WE are able to illustrate herewith two testing appliances which were specially designed for use in connection with the recent speedometer and tyre trials organised by the A.C.G.B.I. Fig. 2 depicts the machine devised for the purpose of calibrating and testing speed indicators. With a view to the elimination of all possible personal error due the stopping or starting of a stop watch and counter, it was decided that the operations should be governed electrically as follows:—The clock is arranged in connection with two electric magnets, which respectively apply and release the counter gear every minute off the same contact, through the medium of a reversing switch governed by the operator. The counter is of the worm wheel type, and carries on its driving spindle the clutch piece, through which it picks up its motion; a means is also provided for setting it to zero; also a brake to check the inertia of the parts when released. The motor is arranged to give the requisite speeds, and is governed in the first place by an adjustable resistance, and finally the speed is kept constant by braking on the edge of a face plate, to which the various types of driving rings are fixed. On the opposite end of the motor spindle to which this plate is attached is the connection for the counter clutch. The motor may be driven in either direction by operating a reversing switch, the motor and counter circuits being cut out simultaneously by a double pole switch in connection with the main supply.

The attachments for carrying the shaft fittings consist of a series of extension brackets, mounted on a cross slide, the latter

Fig. 1.

moving to and from the face plate on a horizontal bed; it also has an angular movement in relation to this plate, and generally allows for adjustments in all directions, and provides a comprehensive means for fitting the numerous types of driving gears. The general arrangements comprise a stout oak bracket, on which is fixed an iron bed carrying the motor and cross slide, an

extension bracket carrying the electro magnets, counter gear, main switch and clock switch, the clock and motor reversing switch being fitted on the vertical face of the oak bracket. The resistance has three sets of ten studs covering the range of

Fig. 2.

resistance required, and is contained in a separate box at the side of the operator.

The method of taking a test is as follows:—Having fixed the driving-ring to the face plate, and mounted the driving gear on the cross slide, the speedometer is fitted to a bracket representing the dashboard. The motor is then started, the counter set to zero, and the clutch taken out. The resistance is gradually taken out till the pointer of the speedometer is on the speed to be tested; then the clock contact is set about a quarter of a minute in advance of the hand, and the operating switch put in. As soon as contact is made the switch is put over and the clutch is taken out automatically at the end of a minute. Care has to be taken to keep the hand of the speedometer steady during this period. The number of revolutions per minute may now be read off the counter, and the accuracy noted in relation to the revolutions of the car wheel, and the speed in miles per hour at which the speedometer is being tested.

The tyre-testing apparatus is illustrated in Fig. 1, and is used for testing the yield or amount of deflection, and return or amount of rebound of pneumatic and other tyres. The tyre, mounted on a rim or wheel, is placed on a bracket, and a weight of 40 lbs. is allowed to drop on it from a given height; the deflection is shown by the pointer attached to the short scale on the left of the machine, and the rebound by the pointer on the long scale on the right side.

MR. A. E. MAJOR has taken Skindle's garage at Maidenhead Bridge, and will conduct it on the lines that have proved so successful at Reading; repairs will be executed promptly and thoroughly and motor-carriages kept for hire.

MESSRS. DUCROS MERCEDES, LTD., have sent us a photo of the new Mercedes Buildings at present in course of construction in Long Acre, London, W.C., on the site of the premises which were burnt down in February, 1905. When completed the new establishment will be one of the largest in London devoted to the motor business. There will be an exceedingly large basement, and this, together with the rear portion of the ground floor, will be devoted exclusively to repair work. The front portion of the ground floor and the first floor will be used as showrooms. The building in all will have five storeys, and the total space at disposal will be 53,000 sq. ft. The Austin and Swift cars will also have their London showrooms in Mercedes Buildings.

## CONTINENTAL NOTES.

### An International Automobile Congress.

An international automobile congress was opened in Milan on the 25th ult. Among the reports presented was one by M. Kellner, of Paris, on motor body building, one by Signor Eurici, of the Fiat Company, on international combustion engines, and one by M. Baillie on public automobile services. On the second day M. L. Ferrus dealt with the subject of spring wheels, Signor Pirelli with pneumatic tyres, M. Jeantaud with electric vehicles, M. Baldini with different forms of motor traction, and Professor Tedeschi with roads. On Sunday the members of the congress went for a motor-car promenade to the shores of Lake Maggiore and Lake Como.

### The Marriage of King Alfonso.

A number of enthusiastic motorists left Barcelona on Saturday on a journey to Madrid to assist in the Spanish Royal wedding celebrations. The run on the first day was to Zaragoza, Guadalajara was reached on Sunday, and the capital on Monday. Nearly thirty cars took part in the trip. The contingent was added to by motorists from other parts of Spain, fully two hundred vehicles lining up in the procession to the Pardo Palace on Monday. Every car carried two large flags, the Union Jack and the Spanish ensign, and in addition many of them had flags draped about the vehicles. Watched by large crowds the cars passed through the city in nine groups. King Alfonso awaited the motorists outside the royal palace in a large grey car flying the purple flag of Castile. He took his place in the procession, and led the way to El Pardo, where he joined Princess Ena; and afterwards a deputation of twenty-two motorists, representing the grandees of Spain, entered the Palace, and offered their congratulations to his Majesty and his bride.

### A Belgian Touring Contest.

An international competition for touring cars, known as the Criterium de Regularité, is being organised by the Automobile Clubs of Belgium, Namur, and Spa, to take place from the 20th to the 25th July next. The competing cars will be divided into four categories as follows:—

- Class 1. Two-seated cars with single-cylinder engines up to 110 mm. bore.
- Class 2. Four-seated cars with four-cylinder engines up to 100 mm. bore.
- Class 3. Four-seated cars with four-cylinder engines up to 100 mm. bore by 120 mm. stroke.
- Class 4. Four-seated cars with four-cylinder engines up to 120 mm. bore by 140 mm. stroke.

The daily runs are:—1st, Spa-Nimegen; 2nd, Nimegen-Cologne; 3rd, Cologne-Diekirch; 4th, Diekirch-Rheims; 5th, Rheims-Dinant, the competitors thus passing through parts of Belgium, Holland, Germany, Luxembourg, and France. The cars in Class 1 will be required to maintain a minimum average speed of 25 kilometres per hour; Class 2, 35 kilometres; Class 3, 40 kilometres; and Class 4, 45 kilometres. Those vehicles which succeed in doing this will be eligible for a 250 mile speed contest which it is proposed to hold on the sixth and last day of the event, full particulars of which can be obtained from the Automobile Club de Belgique, 5, Place Royale, Brussels.

### Cautioning Motor Drivers.

In view of the complaints received and of possible police action, the French Automobile Club has issued a notice to motorists urging them to seriously warn their drivers of the necessity for careful driving, especially when passing through villages. Attention is also drawn to the excessive smoke emitted by many cars, due to careless lubrication of the motor, a nuisance which, if not abated, will probably lead to severe measures being taken by the authorities.

### The A.C.F. Grand Prix Race.

The preparations for the race for the Grand Prix on the 26th and 27th inst. are now well in hand. The grand stands of the A.C.F. are being erected at Pont-de-Gennes, whence the spectators will have an excellent view of the competitors descending a hill known as La Belle Inutile. Owing to the great increase in motor traffic in the Sarthe district consequent

on the race, the Touring Club de France is erecting warning signs near all the level crossings. It is reported that the new Mercedes six-cylinder racers will not be ready in time for the race, and that last year's 120-h.p. vehicles will be used to represent the German team.

### The Tour of France.

The tour of France organised by the Autocycle Club de France commenced on the 22nd ult., when thirteen motor-bicycles, thirteen tri-cars and four voiturettes set out from Paris to Orleans, 79 miles. On the 23rd ult. the run was to Poitiers, 133 miles; on the 24th to Bordeaux, 146 miles; on the 25th to Toulouse, 159 miles; on the 26th to Montpellier, 159 miles; and on the 27th to Marseilles, 127 miles. Up to this point only one competitor had dropped out of the competition, which will finish on Sunday next.

### The Herkomer Touring Trophy Contest.

Preparations for the Herkomer touring trophy contest, which will run from the 5th to the 13th inst., are now well advanced. The cars are to assemble in Frankfort-am-Main on Tuesday next, when they will be inspected by the judges and

The Maharajah of Nandos on his 6-h.p. Wolsley Car.

receive their number plates and frontier pass cards. No less than 160 entries have been received for the event, including Prince Henry of Prussia, who will, it is expected, drive his own Benz car. The Frankfort Automobile Club is giving a luncheon in its new building, after the cars have been examined, and in the evening the competitors will meet at a dinner. The programme of the contest is as follows:—

- June 6th.—Run from Frankfort-am-Maine to Munich.
- " 7th.—Munich to Linz.
- " 8th.—Linz to Vienna.
- " 9th.—Exhibition.
- " 10th.—Vienna, over the Semmering, to Klagenfurt.
- " 11th.—Klagenfurt to Innsbruck.
- " 12th.—Innsbruck to Munich.
- " 13th.—Distribution of Prizes.

The total distance to be covered is approximately 1,000 miles.

### Miscellaneous Items.

The Automobile Club of Spain has just issued an "Annuaire," which contains much useful information regarding motoring in Spain. It includes a list of recommended hotels and repairers in the different towns, and also two useful maps showing the most important roads.—The municipal authorities of Saint Claude (Jura) have issued a regulation restricting the speed of motor-cars passing through the town to 10 kilometres (6½ miles) per hour.—The popular name for the motor-omnibus in Paris is the "autobus."—Altogether twenty-nine entries have been received for the Paris-Tourcoing industrial vehicle trials, which are to be held from the 6th to the 17th inst.

## THE CHAMPION METAL-TO-METAL CONE CLUTCH.

CONSIDERABLE interest was shown at the recent Exhibition at the Agricultural Hall, in the Champion clutch shown by Messrs. Durham, Churchill and Co., of Sheffield. It is of the metal-to-metal cone type, and its peculiarity lies in the operating mechanism, which is designed to give a diminishing back pressure against the pedal as the clutch is thrust further and further out of engagement. Referring to Fig. 1 of the accompanying illustrations, the views given above and below the shaft are sections at different angles showing the operating gear and the driving pins. The construction is as follows:—The sleeve B is connected to the shaft A, and mounted on the latter is the inner cone C in such a way as to be free to slide thereon. At angles of 120 deg. to each other, driving pins D are fixed in the inner cone, and are free to slide in holes made to receive them in bosses B1 on the sleeve B. F presents the flange on the engine crank-shaft, to which is bolted the drum G, which forms the flywheel of the engine and which also carries the outer cone H. The shaft A has a hole J

FIG. 1

FIG. 2

Figs. 1, 2, 3.—Sectional Views of Champion Metal-to-Metal Cone Clutch.

drilled from the inner end, and the lubricator is connected thereto so that the hole can be filled with oil for the lubrication of the bush K in the drum G. Formed on the sleeve B are three bosses or lugs B<sup>2</sup> placed at angles of 120 degrees to each other. To each of these are connected, by means of pins L, two links M which pass through two slots in the inner cone C. The outer ends of these links are coupled to two other links N by means of the pins P. The latter carry rollers O. The other ends of the links N are connected to lugs R on the muff S by means of pins T. Figure 3 shows a section through the springs, which are located between the links and the driving pins. These springs are under compression, their thrust, when the clutch is in gear, forcing the inner cone C along the shaft A until it comes into contact with the frictional surface of the outer cone H. The links M are extended beyond the pins L, and fixed between these links by the pins V are balance weights W, the object of the latter being to neutralise the effect of centrifugal force on the links N and rollers attached thereto.

The operation of the clutch can now be described as follows:—In the position shown the clutch is driving, the power being transmitted from the flange of the crank shaft through the drum and outer cone, and so through the frictional surface of the

inner cone to the driving pins D, which convey the power to the sleeve B secured to the shaft A. To put the clutch out of gear the muff S is moved towards the inner cone by means of suitable operating gear attached to studs fixed in the strap Z. As the muff S approaches the inner cone C the outer ends of the links N are forced outwards; the links M being anchored to the sleeve B by means of the pins L, their outer ends move radially and bring the rollers O against the flange of the inner cone C, and carry the same inwards, putting the frictional surfaces out of contact. It should be noted that when the links are in this position the whole of the thrust of the springs is held by the links M, which are in tension. As will be readily seen, the arrangement of this toggle gear gives a very great mechanical advantage, and, moreover, the nearer the centres of the pins in the link N approach to the same plane as the flange of the inner cone, the less the thrust on the strap, and if the muff were moved so far towards the inner cone as to bring the two centres of the links N into the same plane as the flange of the inner cone there would cease to be any thrust against the strap in the muff. The parts are so made that it is impossible for the muff to quite reach this position, as it is, of course, desirable that the springs should thrust the foot-pedal back into normal position.

When the clutch is held out of gear, however, there is very little thrust on the muff, and consequently very little braking effect on the car.

THE Standard Motor Company, Ltd., have sent us a neat list illustrating and describing the Standard 15-h.p. landaulet specially designed for town use. The engine is located under the driver's seat, enabling the wheel base to be kept within reasonable limits, while at the same time permitting of a wide side entrance.

A COMBINATION 24-h.p. motor chemical fire engine, escape, and hose tender has just been completed by Messrs. Merryweather and Sons for the Fire Department of Shanghai, China. Eight men can be carried, and the machine, fully loaded, will travel at a speed of twenty miles per hour on the level and climb gradients of 1 in 6.

IN company with Mr. Donne, of Messrs. Donne and Willans, we had a short trial run on one of the latest Rochet-Schneider 18-22-h.p. chain-driven cars a few days ago. The efficiency of the metal-to-metal clutch is such that not only were we able to crawl through the thick traffic at Victoria, S.W., without changing gear, but the car started away on top gear.

CONTINENTAL tyres played a conspicuous part during the relief of San Francisco by the automobile corps which was organized by the authorities.

MR. A. LEE GUINNESS has just brought to England the eight-cylinder 200-h.p. Darracq which holds the world's record of two miles in 58 4-5 sec.

MR. JOHN WILSON is the managing director of the Liverpool Motor House, Ltd., which has a well-arranged garage at 6, Atherton Street, Liverpool.

A FIRE occurred on Saturday morning at the Lancashire Steam Motor Company's new works at Leyland, near Preston, when damage estimated at several thousand pounds was done.

THE Middlesex County Council, by placing a notice limiting the axle load of motor vehicles passing over Regent's Park culvert, have practically closed the main road leading out of London on the north to heavy motor vehicles.

DURING the last few days there have been despatched from Messrs. J. W. Brooke and Co.'s works, Lowestoft, a 4-h.p. motor-boat to Belgium, an 8-h.p. boat to India, one 12-h.p. to Canada, and a 30 ft. tender for the "Midnight Sun" for Norway, fitted with a 45-h.p. engine, in addition to several others for home customers.

MR. S. J. PO-COCK, a Parliamentary candidate for the Uxbridge Division of Middlesex at the last election, captured an alleged burglar at a farm near his residence at Sunbury, and lent his motor-car to the police to convey the prisoner to the police-station.

Two motorists were proceeding along the main London road at Kingston on Sunday, and, when endeavouring to avoid the wet tram-lines, the car skidded on the wood pavement and dashed into one of the iron standards at the side of the road. Fortunately the car was only proceeding at a moderate pace, and the occupants escaped injury, but one side of the tonneau was smashed.

THE municipal authorities of Buenos Ayres, Argentine Republic, have lately passed a very stringent ordinance concerning motor-car drivers. It is not deemed sufficient to require them to pass an examination in the operation of all kinds of vehicles and furnish a certificate of character, but they must also submit to body measurements by the police, finger impressions, etc. These regulations, as may naturally be expected, are being severely criticised.

WITH reference to last week's note on the Taunton Motor and Cycle Company, we learn that Mr. J. K. Heard has disposed of the business to Mr. B. E. Denning, who has had considerable experience of the motor trade. He intends to make a feature of a system of free garage for motor-cars, and is erecting additional accommodation to hold twenty or thirty cars beyond the number that can now be located on the premises. Mr. Denning has a large stock of motor accessories, tyres, etc., and will give attention to the repair of cars as well as letting vehicles out on hire.

## HERE AND THERE.

THE Marine Motor Company have issued a neat catalogue of Pasley's marine motors, which are designed for petrol, paraffin, or alcohol.

DURING his trip in Ceylon Mr. C. J. Glidden, the well-known motorist, was, one day, attacked by 175 dogs—surely a record even for the land of pariah canines.

THE Empire Hotels at Buxton and Lowestoft re-opened on Wednesday for the summer season.

THE Automobile Club of Adelaide, South Australia, recently held a reliability trial for motor-cars.

SOME very effective advertisements have lately been brought out in connection with the motor chain department of the Coventry Chain Co., Ltd.

THE new motor garage and repairing works opened by Messrs. Bartlett Bros., at 125, Sheen Road, Richmond, should prove of great service to motorists in that district.

LAST week we referred to the adoption of the motor barge by Messrs. Pickfords, Ltd. The vessel arrived in the Thames from Amsterdam last week, having been imported by Messrs. Perman and Co., Ltd. The new barge has a length of 55 ft. 6 in.

by 12 ft. 4 in. beam, a 3 ft. 6 in. draught, a deadweight carrying capacity of about 20 tons, and a cubic capacity of 53 tons. It is fitted with a 24-h.p. Kromhout motor, and the speed of the boat is approximately 7½ knots. The fuel used is ordinary Russian petroleum.

THE motor-cab fitted with a taximeter was inspected by the Select Committee of the House of Commons which is considering the regulations affecting cabs and omnibuses, in Palace Yard, London, on Tuesday.

WE learn from Messrs. Du Cros Mercedes, Ltd., that

His Majesty the King has taken delivery of a 45-h.p. 1906 model Mercedes, fitted with limousine body by Keilner, of Paris.

MR. PAUL MULLER, of Blackpool, who recently acquired a 28-36-h.p. Daimler car, made an interesting run a few days ago. Starting from South Shore, he drove to Grange-over-Sands, and thence to Bowness on Windermere, and returned home *via* Kendal without a single hitch. The 133 miles were done on a consumption of eight gallons of petrol, which works out at 16.62 miles to the gallon.

AN electric tell-tale for notifying the extinction of the tail lamp on a motor-car by means of an electric bell fixed to the dashboard is being introduced by the Portable Accumulators, Ltd. As the electric bell, actuated by a separate dry battery contained in the device itself, does not depend on the current supplied by the accumulator, the ringing of the alarm is absolutely assured, irrespective of the nature of the interruption of the circuit. Many tell-tales are dependable for their current on the accumulator which supplies the tail light, and providing this is in good order all goes well. The tell-tale brought out by the Portable Accumulators, Ltd., however, being independent of this accumulator, has a greater likelihood of being available when required.

The Mobile 20-22-h.p. Landulet supplied by the Mobile Motor and Engineering Company, Ltd., to Mr. F. G. Demuth, of Edgbaston.

A MOTOR garage is attached to the Bridge House Hotel at Staines.

MR. A. JESSON has a motor garage at Abbey Gate, Leicester.

THE Automobile Association of Bengal is having an exhibition of motor-cars in January of next year.

MR. J. G. LOOKER has established a motor garage at Portland Grove, Heaton Chapel, near Stockport.

MR. JUSTICE JOYCE has declared from the Bench that "we do not want any more motor-omnibuses on the streets."

LORD KENMARE has just placed an order for a 25-36-h.p. Richard-Brasier car with Messrs. Mann and Overton's, Ltd.

FROM the Wolseley Tool and Motor Car Co., Ltd., comes a tariff in connection with their garage in York Street, Westminster.

THE Euston Motor Company, of 124, Euston Road, London, N.W., have been appointed by the Societe Nouvelle des Accumulateurs B.G.S., of Paris, sole agents for Great Britain and Colonies for the B.G.S. electric ignition accumulators.

WE illustrate herewith a special funnel for use in motor garages which has lately been put on the market by Messrs. A. W. Gamage, Ltd. As will be seen, the device is of such a size and so arranged that the usual two-gallon petrol tin may

be fixed in it upside down, and left unattended till empty. In this way not only is time saved but there is no waste of spirit. A filtering gauze is, of course, provided in the funnel.

MR. WALTER BEWLEY has been travelling in the New Zealand mountains on a 9-h.p. Jackson dogcart, arousing much interest among the Maoris. Curiously enough, the horses generally did not exhibit excessive timidity at the presence of the car.

MESSRS. W. WINGATE AND JOHNSTON, LTD., have special arrangements with their agents in Boston, U.S.A., for the shipping from this country and landing in Boston of motor-cars. Considerable numbers of motorists come forward from the United States for touring this country and the Continent, a large number of whom utilise the firm's services.

THE new depot which has been established at Lincoln Place, Dublin, by Messrs. Mann and Overton's (Ireland), Ltd., is now in working order, under the management of Mr. E. M. Stirling. In the showroom are examples of the latest Richard-Brasier and Unic cars, while plant has been installed to enable all classes of repair work to be undertaken. A stock of accessories, oils, and grease are kept on hand, and a feature is being made of garage and hiring work.

SIR ALFRED WATKIN has just acquired a 10-h.p. Star car, with special victoria body.

MOTOR-CARS and cycles are to be experimentally used in the next military manoeuvres in Brazil.

MESSRS. LINLEY AND Co. have ample facilities for the repair of motor-cars at 16, Hills Place, Oxford Street, W.

A SHEFFIELD coach proprietor now owns a motor hearse for the purpose of conveying bodies long distances when railway travelling is impracticable.

NEW members of the A.C.G.B.I. include the Earl of Aberdeen, Baron Elphinstone, Major-Gen. Lord Cheylesmore, and Sir Robert Finlay, K.C.

MESSRS. HALL AND CAPRIS have opened a depot for the sale of the Isotta-Fraschini cars at 14 and 15, Riding House Street, Langham Place, London, W.

A COMPANY is being formed at St. Michaels, Azores, to inaugurate a public motor-car service on the island. It is intended to commence operations with four vehicles.

MESSRS. JOHN FOWLER AND SONS, of York Place, Harrogate, are building motor bodies, and also stocking petrol for the convenience of motorists journeying through the town.

THE Globe Automobile Exporters inform us that they have removed from 56, Boulevard Haussmann, to larger premises at 18, Rue Godot-de-Mauroi, Boulevard de la Madeleine, Paris.

THE Central Insurance Company have prepared a printed card for hanging up in garages, etc., calling attention to the various measures of precaution which should be observed by all having the care of automobiles.

AT a quarterly meeting of the St. Albans City Council a letter was read from the Local Government Board stating that the Board proposes to issue an order under Section 9 of the Motor Car Act of 1903 imposing a ten-mile speed limit in certain streets of the city.

THE chairman of the Westbury (Wilts) District Council told the members that the dust raised by motors did one good thing for the farmers—it killed the flies on the turnips. "It might be an advantage to the turnips," retorted a member, "but it spoils the grass and hay crops."

MESSRS. DRAKE AND GORHAM, LTD., have issued a catalogue of motor-cars which will be of service to prospective owners of cars who are somewhat puzzled with regard to the selection of a vehicle suitable for their particular need. Petrol, steam, and electric cars are included in the list.

FROM the Syndicat d'Initiative du Centre de la France we have received a number of illustrated guides to the district comprised in the title. We shall be glad to send copies to any of our readers who may be contemplating a tour to this interesting part of France, of which the old town of Bourges, the headquarters of the syndicate, is the centre.

THE Deasy Motor Manufacturing Company, who have purchased about seven acres of land at Parkside, Coventry, have already begun to add to their present factory. The very latest type of machinery is being installed, and the new Deasy car, from the design of Mr. E. W. Lewis, is expected to be ready in about six weeks.

FROM Messrs. Singer and Co., Ltd., Coventry, we have received a copy of the 1906 catalogue of Singer cars, which gives particulars of the 8-10-h.p. and 12-14-h.p. vehicles with horizontal engines. Full particulars of the Singer Company's latest production, a 12-14-h.p. car with vertical four-cylinder motor and the standard type of chainless transmission, are given on a separate circular.

ONE of the motor-wagons of Messrs. Jesse Ellis and Co., Ltd., carried a curious cargo the other day. A breeder of trout asked the firm to carry some live fish for him from Harrietsham, Kent, to Lurgashall, Sussex. A five-ton motor-wagon and trailer was dispatched from the breeding ponds at 8 p.m. with forty cans (thirty on the wagon and ten on the trailer), each containing twenty-five live trout 8 in. long. A keeper was sent with them to look after their welfare, and they arrived at Lurgashall, having lost only fourteen fish altogether during the entire distance of about eighty miles. On a similar journey by rail fifty fish were lost.

## CORRESPONDENCE

Letters to the Editor should be addressed to the offices,  
27-33, Charing Cross Road, W.C.]

### SPRING WHEELS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to "F. C.," my car is a two-cylinder Benz dog-cart. All the Benz cars were well sprung, but mine is exceptionally so. With regard to the point he raises as to solid tyres, although india-rubber is certainly not an ideal substance for the tyres of wheels, yet at present, unfortunately, there is nothing to take its place. I do not fancy anyone could stand iron-tyred wheels for anything over a crawl. Spring wheels are not going to do anything for us in this respect, as they are, I believe, all to be shod with solid rubber.

My experience is the following:—The first pair of tyres on the driving wheels wore down to the rims, and I then, through a local agent, had new ones put on at a cost of £3 12s., and these are still in very fair condition. The front wheels, which, in these cars, carry very little weight, have still their original tyres, which, though cut about considerably, are still good for a lot of running. I have had no trouble at all with any creeping or loosening of the tyres. Compare this record with that of any car fitted with pneumatics. My car weighs 14 cwt., the driving wheels are 40 in. diameter, and the tyres are 1½ in.—Yours truly,

J. BRYANT.

### A WARNING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We shall be glad if you will, through the medium of your columns, warn members of the motor trade that there is a man going about amongst the trade at present obtaining motor-cars and accessories by false pretences.

A fortnight ago a firm in Pentonville Road were victimised, and last week a man obtained a car from us by means of a worthless cheque, and on comparing notes we find it is the same man in both instances, and we would therefore like to warn the trade and public that this car of ours, a 10-h.p. Darracq car, 1906 pattern, with long chassis and side entrances, painted red and upholstered in red leather, and fitted with Dunlop N-S. tyres, and with a No. 8910 stamped on the cylinder heads, may be offered for sale either to the trade or to the public indirect. We would be very much obliged if, in the event of this being offered for sale, the party to whom it is offered would kindly communicate direct to us or to the inspector in charge at Vine Street Police Station, London.—Yours truly,

J. KEELE AND COMPANY.

### THE COST OF UPKEEP.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be glad if any reader of the *M.C.J.* would favour me with information on the following points, i.e.: Is the upkeep of a four-cylinder 14-h.p. car much in excess of a 10-h.p. two-cylinder or 8-h.p. single-cylinder? What is the cost, roughly, of running 1,000 miles on a 14, 10, and 8-h.p. respectively? Is a four-cylinder car much more complicated than a two or one, and is tank and radiator with fan a satisfactory cooling arrangement?

I may say that I intend buying a car and looking after it myself. I do not like noise or vibration, and want one capable of taking four persons up any hill on main roads.—Yours truly,

E. J. LONGMAN.

### REPAIR WORRIES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Your correspondent "E S 162," in your issue of May 19th, has opened up a matter which badly requires ventilation. It should command the same serious attention of car makers as it will do of car purchasers. I live within ten miles of the workshop of the makers of my car, but that does not help me to get any better attention than "E S 162," whose geographical facilities are not so great as mine.

When my machine requires the makers' attention I send it to them. In a few days I get a note saying "their expert shall examine it and send me a report." This has happened three times in six months, so I know what to expect. After a week or two the expert reports that the damage has been caused by my man's neglect. The fact that I have had three cars, have a good knowledge of engineering, and my man was educated as an engineer in a technical college, makes no difference. The fault has got to be mine anyhow. The fact that I quietly submit to the blame does not bring the machinery along, and no amount of persuasion will induce them to let me have it under some weeks. I sum the matter up as follows:—The car makers are so full up of new orders

that they want to wash their hands of you as soon as they have sold you a car and pocketed your money. Even the exorbitant charges they make for spare parts is not sufficient inducement to cause them to take any interest in cars once sold, and now, considering that the demand for new cars is so enormous, makers cannot be blamed too much for attending to new orders rather than fiddling with spare parts and renewals. But when I buy my next car, or recommend one to a friend, my first consideration will be, how will the makers look after my requirements after I have bought the car? and my order and recommendations will go to the firm which has the reputation of studying clients already obtained.

The maker of my car took a large amount of trouble before I purchased, but since the treatment I have received has been a disgrace.—Yours truly,

A 1680.

### STEAM CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—If Mr. E. Martin wants a small car to get about in a very hilly district, and he does not mind a little delay in getting ready for the

Touring in France. The De Boigne Column at Chambéry, Savoy.

road, by far the best investment he can make is to get the car of which the Locomobile is the prototype, viz., a Stanley. I was in much the same state of mind as Mr. Martin. I am not a wealthy man, but I wanted a light car that would climb hills, and something that was less capricious than the average petrol car, with its change-speed gears and electrical worries, and, after some runs in a Stanley steamer owned by a friend, I became enamoured at once with its silent running, its freedom from vibration, its easy control, its magnificent hill-climbing, and lastly, and certainly not least, its freedom from smell. I know nothing of the Locomobile, but a friend who owns one and has seen my car says there can be no comparison, that the Stanley is vastly superior in every possible respect, having all the advantages and none of the disadvantages of the former car. I have had no reason to regret the choice I made. I am a country doctor and I use the car for work and for pleasure, but it was for getting round my practice that I got it, having given up horses. I can carry three people on the car plus myself, and have never failed on a hill yet. I had my troubles and worries common to the average beginner, but they are gone, I trust, and now I consider I get a maximum of results out of my bargain. It takes me twenty-five minutes lighting pilot and raising steam to 400 lbs. pressure. As I live at the foot of a steep hill I must always have a full head of steam for the start. In my hilly country, and as I so often have passengers, my mileage is about thirteen

to a gallon of benzine. I can get sometimes twenty-four miles on a tank of water, sometimes not so much—it depends on the road and the load. I have no hand-pumping for air pressure nor water. There is some hand-pumping at the start when lighting up—this ought to be all.  
—Yours truly,

ROBERT A. WELSH, M.B.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Replying to Mr. E. Martin's letter in the last issue of the *M.C.J.*, I have been running for the last nine months a 5-h.p. Locomobile. I am not in the habit of using the car every day, but have covered upwards of 1,000 miles without a single involuntary stop and

The 40-h.p. De Dietrich car with saloon body just supplied by Messrs. Jarrott and Letts to Lady Warwick, who intends to use it for travelling to and from her different estates, and for use during house parties. The vehicle is capable of carrying seven passengers inside and two out, including the driver.

have climbed the steepest hills in my district with two persons up. I can get up steam and be on the road in fifteen minutes and sometimes in less time. I estimate that my car runs about twelve or thirteen miles per gallon of petrol, and twenty-five miles with one filling of water (twenty-five gallons). The capacity of the petrol tank is sufficient for about thirty-five miles.

The cars are not built suitable for very fast running, as the wheel base is too short, but they are capital hill-climbers, and I have frequently passed petrol cars of much greater horse-power. My car is quite capable of averaging fourteen or fifteen miles per hour. The hand-pumping for air pressure can be got over by having a steam air pump fitted; as to hand-pumping water for the boiler, this need not give much trouble if the pump attached to the engine is kept in good order.  
—Yours truly,

INTERESTED.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to your correspondent, E. Martin, if he invests in a Stanley steam car he will then be in the position of the "friends in his need" who assisted him and then left him. I have driven a "Stanley" now for fifteen months in a very hilly district, and it is a fact that there is no car for which the owners of more powerful petrol cars in my district have now such a respect as for the little steamer. A year ago I was scoffed at, but it is not so now. The management of the car is child's play, and no one of ordinary intelligence need have any hesitation in investing in one. The great features about it are absolute reliability, enormous reserve power and small cost of working, such being my experience.—Yours truly,

X 433.

SOME SUNDRY EXPENSES IN MOTORING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—If there was ever a fallacy in this world it is the penny-a-mile motoring! A very great fallacy indeed. As a matter of fact there are few cars which will run on petrol and oil and electricity alone, leaving out everything else, for a penny a mile, but the penny-a-mile theorists lose sight of the real expenses. Let us take tyres—pneumatic tyres, as most people have them. Well, in the case of a reasonably light car, say about 40 cwt., after about 3,000 miles of give and take running retreading will be necessary, which may be reckoned at fifty shillings per cover, without carriage to and from repairers—in fact, it is a very moderate estimate. Added to this must be the few incidental tyre troubles—3,000 miles is a good way to go with no tyre trouble—these and their repairs may be mildly computed at five pounds. So here we have £15 in 3,000 miles for tyres alone, so that we can surely reckon one penny per mile as a very mild estimate for tyres only. In passing on we must not forget lubricating oil; people generally pass this over, reckoning roughly a few shillings on oil for an almost indefinite distance. The general price paid for lubricating oil is four shillings and sixpence a gallon, and most cars now need it pretty freely, and a gallon does not

go very far. Another expense the penny theorists leave out, i.e., the occasional trouble; e.g., your accumulator runs out, and you have to send for another one, or assistance in some form or other. Help usually arrives in the form of several people, and generally a large number of tips are necessary. It should be noted, also, that if this last-mentioned trouble occurs at all late, going home is usually put off, and quarters found for the night. Another expense—never counted!!! This by no means completes the list; but, after all is said and done, motoring is cheaper than horses, and to most people more suitable, so if you can do your running at 3d. per mile, why be downhearted?—Yours truly,

C. B.S.

SMELL AND SMOKE FROM MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With regard to Mr. A. Duckham's letter on "Smell and Smoke from Motor-cars," which appeared in the last issue of the *M.C.J.*, I should like to know if it is possible to use paraffin for lubricating the cylinders and crank chamber of cars used for touring purposes, or more especially for work in London? If paraffin can be used with as good results as ordinary lubricating oil, why has it never been used before? Surely there must be some reason why paraffin is not more used?—Yours truly,

STUPEFACTUS.

CRACKED CYLINDERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have a 5-h.p. single-cylinder motor the water-jacket of which is cracked. I believe steel filings mixed with some kind of acid will rust it up. Can you tell me the name of the acid, or where to procure the mixture, and how to apply it?—Yours truly,

R. H.

[The liquid used in conjunction with steel filings for rusting cracked water jacket is sal ammoniac dissolved in water. The crack should be filled with filings and the sal ammoniac either placed in the jacket or poured over the filings. If the crack is only small, a little gold size mixed with lamp black will sometimes stop the leakage, but this should be allowed to get properly hard before the motor is used.]

A DARRACQ CAR EXPERIENCE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to "W. R.'s" query re the 20-32-h.p. Darracq car in the last issue of the *M.C.J.*, I send you a photo of my 1906 model as supplied to me by Mr. T. Garner, Manchester. The ignition is by coil and accumulator and also low tension magneto. The wheels are fitted with Moseley's "Perfect" tyres, 34 by 5 in., which makes the removal (when necessary), a very simple matter. The car is exceedingly comfortable and has given entire satisfaction, no trouble has been experi-

enced with the car, and the new improvements are to the advantage of the motorist and make driving a pleasure.

I registered in Gloucester, so that the identification mark should correspond with my initials.—Yours truly,

FRANK HULME.

A DARRACQ CAR QUERY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to "Lancashire's" query in the last issue of the *M.C.J.*, I have a twin-cylinder Darracq which had a plain coil and contact breaker, and which was always difficult to start. I fitted a trembler-coil, and retained the contact breaker, but when I tried to start the

engine it always backfired. Then I took the cam off and had the raised portion set back five-eighths of an inch and lengthened, so that it gave a longer contact. Result is very satisfactory. It now starts without any difficulty.—Yours truly,

OPENSHAW.

### ENGINE TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have an 8-h.p. single-cylinder engine which gives me a lot of trouble. When the current is switched off the motor continues to run for some time. The cylinder has been taken down and scraped clean, but there is only a little improvement. Is the fault with the water circulation? A stream of water the size of the finger runs into the tank when the pump is at work. I have cleaned the gauze filter. I may mention that the car has only run 2,000 miles. Any information you can give me will be greatly esteemed.—Yours truly,

R. LITTLEWOOD.

[The running of an engine after the current is switched off is sometimes caused by small particles of metal attached to the cylinder head, which become heated whilst the engine is running, and so fire the charge after the current is switched off. Another cause is due to the fact of the cylinder head becoming heated, this being sufficient to fire the charges if the compression of the engine is high. The best remedy we find is to first open the compression tap, and then switch off; this prevents the engine continuing to run.]

### MOTOR-CARS AND DUST.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Motor-cars are being accused all over the country as the cause of the dust nuisance. The fact appears to be overlooked that the dust is made by the heavy, slow-going, iron-tired vehicles, which simply crush to powder the flints or anything else, of which the country roads are made, and which pneumatic tyres are incapable of doing. Naturally a fast moving car with pneumatic or even solid rubber tyres stirs up the dust, which was already there.—Yours truly,

A. GROVES.

### A LEAKY WATER TANK.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The water tank of my car has developed a number of small leaks, and I write to ask whether you or any of your readers can suggest a means of stopping up the same. The leaks, which are only small, are in the bottom of the tank, which is fixed at the rear of the car, and appears to be made of sheet iron. As far as I can see, the only way to remove the tank is by taking the body off, and this is rather a long job for me to undertake.—Yours truly,

R. L. KING.

[The leaks in the water tank may be stopped by giving a good coat of colour mixed with gold size; this would not, however, be satisfactory if the leaks were bad. It would be necessary to first draw off the water, otherwise the water would not allow the filling to set over the leak. Failing this, there is no other remedy but to remove the tank and solder the holes. The removal of the body is not usually a great matter, being held on by about six or eight bolts.]

### AN ENGINE QUERY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have come into possession of a beautifully built single-cylinder air-cooled internal combustion engine for a tri-car. The late owner said it was a  $3\frac{1}{2}$ -h.p., but on comparison with most engines of that power I am inclined to think it must be much higher in power. The bore of cylinder is 3.732 in., stroke  $3\frac{1}{2}$  in.; the crank case is of aluminium. Yet the engine without the carburettor and exhaust union weighs 58 lbs. and the internal balance wheels are 9 in. diameter. I therefore suppose this engine to be more like 4½-h.p. than 3½-h.p., as suggested; am I right?—Yours truly,

J. COPLAND.

[The horse-power of our correspondent's engine, according to formula, works out approximately at 3.486-h.p., but no doubt this would be a little exceeded on the brake. In any case it would not be so high as 4½-h.p.]

### THE HORSE-POWER OF PETROL MOTORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The question of a uniform basis for the rating of the power developed by petrol motors continues to be one of the pressing needs of the automobile industry, but one which, judging from the chaotic ratings one sees in the different makers' catalogues, is still far from a solution. In fact, there appears to be a very prevalent tendency to overrate the power of petrol engines, although there is no reason for believing that this pernicious practice is peculiar to the motor industry; on the contrary, as an industry develops and competition in it becomes keen, there is always a temptation to exaggerate the relative value of its products, or their

capacity for doing work. There are generally a number of possible methods of testing the capacity of the machines, and the natural tendency is to adopt that method which gives the highest results, irrespective of whether it corresponds to the conditions of practical use or not.

Now that some of the large engineering colleges are taking up the subject of petrol motor tests, it would be of great advantage were the leading builders to agree on some definite method of engine testing, so that the results obtained from different motors might be compared. It is well known that so-called instantaneous brake tests are very misleading, and a minimum time should be fixed during which the load should be kept constant. Any testing device which does not admit of maintaining a constant load on the motor for that length of time should be considered unsuitable for the purpose. Another point to be considered is whether motors should be tested with or without a silencer. It has, of course, been shown that even a good exhaust-box may increase the power of the motor, instead of reducing it, but this is not the rule, and as in practice engines can only be used with silencers connected, it therefore seems only reasonable to test them with these devices fitted. When the much-desired time comes when a standard method of making engine tests is decided on, the results will convey a

A Tie for Second Place!

definite meaning and the death knell of the present stupid practice of rating engines as of 14-22-h.p. or even 40-60-h.p. will have been sounded.—Yours truly,

R. R. BARRACLOUGH.

### A HINT RE FITTING A NEW TYRE COVER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—When it is necessary to mount a new cover, there is no necessity for three or four grown-up men to struggle with it. The best way is to leave the security bolts in, put the cover and tube in position by the valve hole, and then lever the cover on. When in position it will be found that it is resting on the clips, and all that is then necessary is to lift up the inner edge of the cover with a couple of levers and push the clip up, and then let cover back. Simplicity itself. If this method be adopted, the most refractory cover will not require more than two people to struggle with it.—Yours truly,

C. A. R.

MR. L. C. PARKER, of the Mill House, Barton Mill, Mildenhall, has found between Thetford and Mildenhall a motor wheel grease cap. The owner can have same upon sending description to Mr. Parker.

## THE MOTOR MEET AT BIRMINGHAM.

—●—

UNFORTUNATELY the rain that fell so freely in the early part of Saturday last marred the record-making character of the first provincial meet of the Motor Union for this year. Happily no rain fell during the gymkhana, which formed a feature of the gathering, and altogether the assembly at Birmingham must be regarded as entirely successful.

The proceedings commenced on Friday, the 25th, with a meeting of the General Purposes Committee, and Mr. G. T. Langridge in the chair, supported by most of the members of the Committee. It was agreed to allot the club's gymkhana medals to the Blackheath, Bury and West Suffolk, Derby, Essex County, Herefordshire, Kent, Lincolnshire, and Midland clubs. Discussion also took place on the fitting of exhaust box cut-outs, and motor-car makers may expect a communication from the Union on the subject.

On Saturday morning the Hon. A. Stanley presided over the meeting of the General Committee, those present including Earl Russell (A.C.G.B.I.), Dr. J. Hopkins Walters (Berkshire A.C.), Messrs. Granville M. Kenyon (Kent), Alan McAlpin (Leicestershire), A. R. Atkey (Nottinghamshire), E. Shrapnell Smith, A. A. Dale, C. H. Dodd; T. H. Ryland (Midland A.C.), Frederick Coleman, Percy W. Northey, and F. J. Sharpe; J. R. Bedford (Birmingham), C. J. Allin and C. Turner Leach (Derby), F. Lindus Forge (Essex), N. B. Kenealy and C. McWhirter (Herts.), R. Sutton Clifford, jun. (Leicestershire), A. E. Jones, F. R. Hesse, D. Adamson Parkyn, and J. A. Morris (Man-

past obstacles, crossed a line, and returned backwards over the same course; (3) musical chairs; and (4) ladies' passenger race. In the last-named the competitors were required to drive 75 yards, alight, assist a lady from a chair on to the front seat of the carriage, retake seat, drive a further 75 yards, alight, and assist a second lady from a chair to the back seat of the carriage. The same performance was gone through in regard to a third lady, and then the competitor drove to the finishing point. This race, for which fourteen motorists had entered, was admirably contested. Great care had to be exercised owing to the wet turf, and all sorts of non-skidding appliances were requisitioned. In stopping the cars a few of the competitors, in their excitement, also stopped their engines, thus robbing themselves of all chances of success.

The results were as follows:—Starting and stopping race, 1, Mr. E. W. Lewis (16-h.p. Rover); 2, Mr. G. H. Lanchester (12-h.p. Lanchester). The pair were a dead heat in the preliminary trial. The other heat winners were the Hon. C. S. Rolls, whose car was driven by Mr. Graham; and Mr. F. W. Keen. Messrs. E. M. C. Instone, G. H. Lanchester, E. W. Lewis, and F. A. Coleman qualified for the Ladies' Passenger Race; and premier honours fell respectively to Mr. Lanchester and Mr. Instone (35-h.p. Daimler). Prizes were also awarded to the following lady passengers: Mr. Lanchester's car, Miss Thomas, Miss Barnsley, and Mrs. Lanchester; Mr. Instone's car, the Misses Greaves, Barnard, and Davis. Mr. S. Downing (10-h.p. Alldays) won the obstacle race; and Mr. G. S. Moore (6-h.p. Jackson dogcart) was second; Mr. W. Guilding (10-h.p. Star) was the winner of the musical

The Midland Automobile Club's Gymkhana. The Lady Passenger Race.

chester), T. Clayton, W. Ballin Hinde, A. G. Johnson, Frank Lanchester, and C. P. Type (Midland), S. F. Harris (Northampton), A. Barlow and Booth Granger (Nottinghamshire), A. E. Newton (Reading), A. Armitage (Somersetshire), J. Thompson Willows (South Wales), A. Scrase Dickens (Sussex), E. H. Atchley, R. S. J. Hannen, J. Sutcliffe Pyman, and J. H. Reeves.

It was resolved that a letter should be sent out on the subject of stone throwing by children, and some conversation took place on the dissolution of the Reading and Burnley automobile clubs, it being generally agreed that their absorption into the county organisations was rather an indication of the strength of the movement than otherwise.

### THE GYMKHANA.

For the entertainment of the visitors and the benefit of the Moseley Convalescent Home, the Midland Automobile Club had organised a gymkhana, and although the grounds of the hospital—where the event took place—were saturated with wet, the rain fortunately withheld and a very enjoyable afternoon was spent. Some of the events were productive of much humour, while others called for a good deal of skill and resource from the drivers. The competitions furnished a test of the cars and of the efficiency of their equipment. There were four events: (1) A starting and stopping race, in which the competitors were required to start from a line, race over a straight course, and terminate over a line without touching a brick wall; (2) an obstacle race, in which the contestants started from a line, drove over the course

chair competition; Mr. Downing being second. The silver medal offered by the Motor Union for the most meritorious performance was secured by Mr. Lanchester. The prizes were presented by the Hon. A. Stanley, M.P., who, with Messrs. W. Ballin Hinde and T. Clayton, officiated as judge. The starter was Mr. W. Rees Jeffreys, the secretary of the Motor Union. The arrangements were well carried out by a strong local committee, with Mr. T. H. Ryland as hon. sec.

### THE DINNER.

The annual dinner of the Midland Automobile Club, held at the Grand Hotel, Birmingham, on Saturday, proved an important event, owing to the attendance of many members of the Motor Union. Mr. J. Broughton Dugdale presided, and after the loyal toasts had been honoured proposed "The Motor Union," expressing warm appreciation, on behalf of Midland automobilists, of the work of that body. They had done a self-sacrificing work on behalf of the motoring interests of the country generally. They heartily welcomed among them so many ladies, to whom the improved means of locomotion must strongly appeal. They would be able to exercise a very beneficent influence, by repressing inconsiderate drivers.

The toast was responded to by the Hon. A. Stanley, M.P., who expressed his great satisfaction with the agreement which had been entered into between the Motor Union and the Automobile Club. Last year much was done in the direction of smoothing down differences and in removing causes of friction between the two bodies. The

work of each had been clearly defined, and the results had been all that could be desired. Not a single cause of difference had arisen. In regard to legislation, as affecting the motor movement, the hon. member stated that so far as he could ascertain the tendency was not to initiate any new laws this year. There were many reasons why motorists wished for legislation, because under the existing Act there were many anomalies, absurdities, and in some cases considerable hardship. The present Act, however, was only a temporary one, and expired this year. When legislation came it would be of a permanent character. Motorists were largely increasing, and it seemed that the deferring of legislation would prove of advantage in ultimately securing a satisfactory bill.

"The Midland Automobile Club" was proposed by Mr. A. R. Atkey (Nottingham), who related an interesting anecdote showing how the motor-car strikes the child mind. A scholar was asked to explain the meaning of the scriptural term the "quick and the dead." The reply was that those who got out of the way of the motor were the quick and those who did not were the dead.

The toast was acknowledged by Mr. T. H. Ryland, who, as showing the work of the Midland Club, mentioned that this year over 800 letters had already been sent out, as well as 3,500 circular letters. The police all round this district, and especially those of Birmingham, had always treated the motor question in a perfectly level-headed manner, which he was able to point out to the Royal Commission on motor-cars when giving evidence before them. He did not think there had been a single prosecution in the city of Birmingham for exceeding the speed limit since the Act had been in force. Captain Anson, the Chief Constable of Staffordshire, who was unable to be present, had written that if motorists would turn every corner in the belief they were going to meet an old lady seated in a bath-chair, the duties of policemen would be reduced to a minimum. Mr. Ryland thought this remark was absolutely sound, for half the trouble arose from taking cross roads and corners at anything beyond the speed one knew to be safe. Captain Anson also mentioned that complaints as to the conduct of motorists were decreasing.

Mr. T. Hamilton Barnsley, late chairman of the Midland Automobile Club, proposed "Our Guests."

Earl Russell, in responding, pointed out that motorists were much concerned with local authorities; therefore he was pleased to notice the presence of the Mayor of Aston. As automobilists they were especially anxious to maintain good relations with local authorities and to persuade them that their object was not to kill their children, depopulate their schools, or tear up their roads; all they wanted them to do was to make the roads fit the traffic and erect signs showing where care should be exercised. The local authorities were meeting the demands of automobilists at present to a large extent. What local clubs had to do was to bring together automobilists who would not otherwise meet and form an association where they would be in immediate touch with the local authorities, and where they knew their requirements better than anyone else. The particular function of the Motor Union was to form a proper public opinion in regard to the motor movement, and in this the union had been wonderfully assisted by local associations.

Mr. A. G. Johnson's toast of "The Chairman" concluded the list of speeches, thus bringing the pleasant gathering to a termination.

## MOTOR OMNIBUS PATENTS.

At an extraordinary general meeting of the Motor Traction Company, Ltd., held on Tuesday to consider the scheme for the sale of the undertaking to a new company, Mr. F. H. Bromwich, the chairman, stated that the licence they had acquired conferred upon the company the right to manufacture, or to run, or to licence to run, in Great Britain any motor vehicle under the Daimler system or the De Dion-Bouton system. The Daimler omnibus, popularly known as the Vanguard, was, he thought, generally recognised as one of the best motor-omnibuses in existence. The Mercedes car, too, was acknowledged as one of the best cars on the market. The company had the right to manufacture these vehicles without going to the expense of experimenting. The Daimler and De Dion-Bouton companies abroad were full up with orders. There was no question whatever about the company's title to the rights he had mentioned. The licence gave them in addition the sole and exclusive right to run omnibuses under the Daimler system within London and an area of twenty miles. That right was most important. Every single omnibus constructed under the Daimler system, including all, or, at any rate, most of the Vanguards, was running in infringement of their rights, and they were entitled to stop them running and claim damages. He explained at the last meeting that counsel had been consulted. Since then they had laid the papers before Mr. Rufus Isaacs, K.C., and at a conference on the preceding day he had given it as his opinion that the company is entitled in effect to an exclusive licence under the Daimler system, and that in the action they were bringing the company would get a verdict in their favour. In reply to a shareholder who asked who had taken up the new shares when the capital of the company was increased from £60,000 to £120,000, the Chairman explained that the capital was increased for the express purpose of paying for the new rights they had acquired. The new capital went principally to the Mercedes-Daimler Company and Mr. S. F. Edge.

## SOME SHORT WHITSUNTIDE TRIPS.

BELOW we give some suggested runs of about fifty miles out and home from several of the leading centres of motoring interest. These can be varied according to circumstances; they are only intended to suggest short runs of interest; and we shall be glad to hear from readers able to give alternative routes or propose suitable trips.

### FROM NORTH-WEST LONDON.

Marble Arch to Kilburn (2½), Cricklewood (1½), Edgware (4½), Stanmore (2), Bushey (2½), Watford (1½), Rickmansworth (3½), Chorley Wood (2), Amersham (6), Beaconsfield (5), Gerrard's Cross (4½), Uxbridge (4), Hayes (3½), Hanwell (3½), Ealing (1½), Acton (1½), Shepherd's Bush (2½), Marble Arch (2½); total distance, 54½ miles.

To Moortown (2), Harewood (5½), Pannal (5), Harrogate (2½), "Little Wonder" (1), Blubberhouses (8), Bolton Bridge (7), Addingham (3), Ilkley (3), Otley (6), Bramhope (3), Leeds (7½); total distance, 53½ miles.

### FROM LIVERPOOL.

Birkenhead to Newferry (2), Eastham (3½), Backford (5½), Chester (3½), Saltney (1½), Hawarden (4½), Queensferry (1½), Hinderton (7½), Parkgate (2), Heawall (3), Thurston (2), West Kirby (3), Hoylake (1½), Moreton (3½), Bidston (1½), Birkenhead (3½); distance, 51½ miles.

### FROM NEWCASTLE.

To East Denton (3½), Walbottle (1½), Heddon (2½), Harlow Hill (3½), Matfen Piers (2½), Matfen (2), Stamfordham (3½), Black Heddon (3½), Belsay Castle (2), Bolam (3), Meldon (2½), Milford (5), Morpeth (2), Stannington (4½), Seaton Burn (3½), Gosforth (4), Newcastle (2½); total distance, 57½ miles.

### FROM BIRMINGHAM.

G.P.O. to Smallheath (2½), Yardley (1½), Edmdon (3½), Stonebridge (2½), Kenilworth (3½), Leamington (4½), Warwick (2½), Hatton (2½), Wroxall (3½), Knowle (5), Solihull (2½), Olton (2½), Greet (2½), G.P.O. (2½); total distance, 46½ miles.

### FROM IPSWICH.

To Copdock (4), East Bergholt (5½), Manningtree (3), Tendring (6½), Weeley (2), Little Clacton (3), Clacton-on-Sea (3½), Great Holland (5), Kirby (2), Beaumont (4), Great Oakley (3), Ramsey (3½), Harwich (3½), Felixstowe Pier (1½), Walton (2½), Trimley (1½), Ipswich (8½); total distance, 62½ miles.

### FROM BRISTOL.

To Keynsham (5), Saltford (2½), Bath (4½), Batheaston (2½), Box (3½), Pickwick (3), Chippenham (4), Yatton Keynell (4), Burnell (4½), Acton Turville (1½), Tormarton (3), Codrington (3), Downend (5½), Eastville (3), Bristol (1½); total distance, 50½ miles.

### FROM SHEFFIELD.

To Lidgate (2½), Ashopton (8½), Bamford (2½), Hatherage (2½), Grindleford Bridge (2½), Calver (2½), Baslow (2), Chatsworth (2½), Baslow (2½), "Peacock Inn" (5), Totley (1½), Beauchief Abbey (1½), Sheffield (4½); total distance, 40½ miles.

## CLUBS AND ASSOCIATIONS.

### NORTH EASTERN.

THE North Eastern Automobile Association will hold a hill-climbing competition on the road from Broadwood to Durham on the 16th inst. The hill rises 233 feet in a total distance of 880 yards, giving an average gradient of 1 in 11.3, and a maximum of 1 in 5.3 for about forty yards near the top of the hill. There is a stretch of 170 yards of nearly level road at the bottom of the hill to allow competitors to attain a fair speed before the real ascent is reached. There will be eleven classes, as follows:—

Class.	Description.	Total capacity of cylinders.
1. ...	Motor-bicycles ...	Not exceeding 5 litres
2. ...	" " " " ...	Exceeding 5 "
3. ...	Tri-cars " " ...	No limit.
4. ...	Motor-cars " " ...	Not exceeding 1.3 litres
5. ...	" " " " ...	" 2 "
6. ...	" " " " ...	" 2.5 "
7. ...	" " " " ...	" 3 "
8. ...	" " " " ...	" 4 "
9. ...	" " " " ...	" 5 "
10. ...	" " " " ...	" 6 "
11. ...	" " " " ...	Exceeding 6 "

Steam cars will be allowed to compete in the same classes with petrol vehicles, each double-acting cylinder being reckoned equal to four cylinders of an internal combustion engine.

Entries should be made to Dr. J. McHaffie, Talbot House, Tyne Dock.

The entrance to Knowsley Park, near Liverpool, the seat of the Earl of Derby, where the Eliminating Trials for the British Team for the International Motor-cycle Race are to be held.

### NORTH LONDON.

ON Saturday last the North London Automobile Club were the guests of their president at his mansion at Forty Hall, Enfield. There were over a hundred members and friends present, who, after being received by Col. Bowles, were conducted through the delightful old world garden, an interesting feature of which was the salt-water aquarium and a very fine collection of sea anemones. After tea, taken in a marquee, a coach-house race was held in a part of the grounds near the lake, when the hon. sec., Mr. Charles Smith, was again successful in winning the first prize.

The following is the order in which the competitors finished:—

Mr. Charles Smith...	12-h.p. Darracq ...	23.2 sec.
Mr. Max Graddon ...	15-h.p. Panhard ...	29.2 "
Mr. W. Cornwall ...	16-h.p. Albion ...	39.4 "
Mr. Lendrum ...	10-12-h.p. Darracq ...	41.2 "
Mr. W. Holmes ...	12-h.p. Darracq ...	44.4 "
Mr. F. Horton ...	6½-h.p. Darracq ...	46. "

The undermentioned gentlemen were disqualified in consequence of their cars touching the hurdles:—Messrs. Alexander, G. Smith, Bransom, Griffiths and E. Swingle.

Messrs. J. T. Barber and G. Cannon acted as timekeepers.

After witnessing this amusing competition, the guests assembled in the dining-room, where, in a few well-chosen words, one of the vice-

presidents, Mr. A. W. Gamage, thanked Colonel and Mrs. Bowles on behalf of the club for their kind hospitality. The Colonel, in reply, said it gave him much pleasure in welcoming them to his house and hoped they would again visit him next year. This terminated that which, in spite of the uncertainty of the weather, proved to be a most enjoyable afternoon.

### CEYLON.

A MEETING of the committee of the Automobile Club of Ceylon was held on the 1st ult. at the Queen's Hotel, Colombo, where there were present Messrs. Biddulph, Hall Brown, Clarke, Goodman, and North. Mr. J. R. Hardy, Mr. A. Greig, and Capt. Hon. T. Napier were elected members.

It was decided not to have the trials owing to insufficient entries.

A circular from the Planters' Association of Sabaragamuwa re stray cattle and dogs was read, and it was resolved:—"That this Club are in entire sympathy with the resolution passed by Sabaragamuwa, and will be pleased to co-operate with them in any steps that are taken."

### HUDDERSFIELD BRANCH OF Y.A.C.

THE second annual hill-climbing contest in connection with the Huddersfield branch of the Yorkshire Automobile Club took place on Saturday on a length of road leading from Meltham towards Isle of Skye. The length of the course was a mile and 47 yards, and there were twenty-five entries in all—three in class A for small cars, six in class B, and sixteen in class C, which included cars ranging from 8-h.p. to 40-h.p.

The winners of medals were as follows:—Class A: W. B. Lawton, Huddersfield, 8-9-h.p. Corre; time, 7 min. 10 1-5 sec.; points, 124. Class B: W. Singleton, 10-h.p. De Dion; 5 min. 9 2-5 sec.; 136 points. Class C: D. Stoner, Crowther, 40-h.p. Napier; 2 min. 11 1-5 sec.; 124 points. Mr. Singleton took the cup with the highest points, 136. Mr. A. Farnell, Bradford, made the fastest time, 2 min. 3 2-5 sec., with a 30-h.p. Daimler; and Mr. Herbert Walker the next best, 2 min. 9 sec., with a 30-h.p. Daimler.

THE Hertfordshire County Automobile Club will have a run to Cambridge on Whit-Monday.

THE week-end meet of northern clubs at Buxton will take place at the Empire Hotel on the 23rd inst.

### NEW COMPANIES REGISTERED.

PATIN TYRE SYNDICATE, LTD.—Capital £1,200. To acquire the British and colonial rights in a patent tyre invented by O. Patin, of Paris, and to carry on the business of manufacturers of and dealers in tyres for motor vehicles, etc. Registered office, 13, Clifford's Inn, E.C.

DARRACQ-SERPOLLET OMNIBUS COMPANY, LTD.—Capital £500,000. To acquire from L. Serpollet and A. Darracq and Co. (1905), Ltd., the goodwill, patents and patent rights (except for Italy) in connection with the manufacture of steam motor-omnibuses, motor-wagons, motor-boats, and other means of transport belonging to the said L. Serpollet, and to carry on the business of motor-omnibus, van, lorry, car, cab, and vehicle manufacturers, with steam, petrol, electric, or other power, garage proprietors, engineers, etc. Registered office, 2, Coleman Street, E.C.

BEAUFORT MOTOR COMPANY, LTD.—Capital £150,000. To carry on the business of motor-car, omnibus, van and cab manufacturers, etc. The first directors are Messrs. J. E. Lound, R. V. Jellicoe, A. V. Cowell, Sir Frederick Frankland and W. A. Turquand. Registered office, 14, Baker Street, W.

HEDGE LAND AND CO., LTD.—Capital £15,000. To acquire from Messrs. T. K. Webster and F. W. Hedgeland the benefit of certain existing inventions relating to axles and clutches, and to carry on the business of axle manufacturers, engineers, builders of motor-cars and other vehicles, etc. Registered office, 76, Cheapside, E.C.

GEARLESS MOTOR OMNIBUS COMPANY, LTD.—Capital £220,000. To adopt an agreement with the Cerol Syndicate, Ltd., for the acquisition of certain property, and to carry on the business indicated by the title. The first directors are Messrs. E. Manville and P. Dawson, both of 29, Great George Street, S.W.; F. Rawson, 7, Penywern Road, S.W.; G. H. Hopkinson, 4, Bloomsbury Street, W.C.; and J. J. Newbould, Tatenhill, Burton-on-Trent.

### ROAD REPORTS.

WESTMINSTER.—Savoy Hill is to be repaved between the 18th inst. and 2nd prox. King's Road and Marsham Street will be dealt with in the previous week. Charing Cross Road and St. Martin's Lane will be repaved by the Westminster City Council in September.

EASTBOURNE.—Several more important roads in the borough are to be laid with tarmac.

WEST SUSSEX.—Warning boards are being erected to mark the presence of some of the severe hills in West Sussex, but more are wanted, and we would suggest to the authorities the advisability of thus distinguishing Crocker's Hill, between Rogate and Midhurst—a very perilous and sinuous hill.

## CASES AGAINST MOTORISTS.

AT the Lancaster police court on Saturday, Harry Alger, chauffeur to Mr. Pickersgill, of Sunderland, was alleged to have driven a car over the measured quarter of a mile at the rate of thirty miles an hour. The defendant insisted that he was not driving at anything like that speed. On his behalf it was urged that it was not safe to convict on the evidence of one timing police officer, because he had to start and stop his watch in very little time after receiving a signal, and then he had also to signal to another officer to stop the car. If two watches were used for each case the Bench would see that they varied in most instances. A fine of £7 10s. and costs was imposed.

MR. BRUCE INGRAM, editor of the "Sketch" and "Illustrated London News," has been, at Brompton County Court, ordered to pay £25 damages for running over with his motor a pedigree fox-terrier belonging to Mr. J. R. Thonger. The unsuccessful defence was that the dog was not under proper control.

AT Worcester, Harry Joyce, Sydenham Road, Small Heath, tube manufacturer, was summoned for driving a motor-car in the Tything at a speed dangerous to the public. Mr. Blewitt, Birmingham, defended, and pleaded not guilty. The Chief Constable said P.C. Guy saw defendant travelling towards Harbourne at a speed estimated at from twenty to twenty-five miles an hour. He could not catch the whole number, but saw the letter "O" and the first figure "8." A cabman saw the number, "O-816," and defendant, the owner of the car admitted that he drove through the Tything on the evening of the date named. Two shopkeepers, a policeman and seven cabmen gave evidence

twenty miles an hour on the Burton road at Mickelover, on May 1st, and also for driving a motor-car in a manner dangerous to the public. Albert Roberts told the Bench that on the morning of May 1st he was cycling on the Burton road at Mickelover, in the direction of Burton-on-Trent. He was riding in the middle of the road, or rather to the left, and from that time he remembered nothing more until he recovered consciousness at the Derbyshire Royal Infirmary. Cross-examined by Mr. Blewitt for the defence, he said he never heard the motor-car approaching, and did not know what happened to him. The magistrates imposed a fine of £10 and costs.

HENRY BURGISS sued A. G. Smith, managing director of a motor-car company, of Drawstead Road, Streatham, for £10 17s. 6d., damages for injuries received in consequence of the alleged negligent driving, by defendant, of his motor-car, at Streatham Hill. It seemed that on Good Friday plaintiff, with his wife, was cycling through Streatham towards London, plaintiff being in front. As he neared the Dewstead Road turning, defendant, who was in a motor tri-car, came from behind, and turned in front of plaintiff into Dewstead Road. Plaintiff had no time to pull up, and the front wheel of his cycle struck the motor-car. The Judge found for plaintiff, and awarded him £8 damages.

AT the Horsham Petty Sessions on Saturday, four cases against motorists for furious driving were heard, the fines ranging from £2 to £10. In the case of one defendant, who, in his absence, was fined £5, the fine was reduced to £3 when, later in the day, he appeared.

THE Sultan of Zanzibar, who is travelling incognito in England, has been held up by the police on the Victoria Embankment, London, owing to the excessive speed at which his motor-car driver was travelling. The

M. Teste on the Panhard Racer which he will drive in the contest for the Grand Prix de l'A.C.F. The Panhard cars for the forthcoming race are provided with a new design of four-cylinder engine. The transmission is direct on top speed through a cardan shaft to a live back axle.

for the prosecution, their estimates of speed ranging from thirty miles an hour to eighty yards in the second, this latter exaggerated notion being advanced by a cabman. The defendant was fined £5, including costs.

AT Romford, John Woodham, chauffeur, Havering-atte-Bower, was summoned for driving a motor-car at a speed exceeding 20 miles an hour at Romford. Evidence was given by P.s. Addison, P.s. Edwards, P.s. Robinson, and P.c. Mann, to the effect that on his way to Romford Station defendant covered a mile in 2½ minutes. When spoken to at the station by P.s. Addison defendant said:—"I was driving to catch a train. What time did I do the mile in?" Defendant, who had been fined before for a similar offence, was now fined £7 10s. and costs 4s. The chairman (Mr. Joslin) said the employers were often more to blame than the drivers.

W. T. ASHFIELD, of Wellington Street, Strand, was summoned at Farnham for driving a motor-car to the danger of the public. A constable stated that defendant drove through Yorktown at a terrific pace. He could not stop defendant, but by telephoning to the Hampshire police he had him pulled up twenty-five minutes later at Basingstoke, sixteen miles away. Defendant was fined £10 and costs.

AT the Dartford Petty Sessions, James McKnaught, of West Ham, was summoned for driving, at the Broadway, Bexley Heath, a heavy motor-car and trailer, without having a person competent to apply the brake, as required by the law in the case of a car of that weight. Fined 10s. and costs.

EDGAR LINES, sanitary engineer to the Chesterfield Rural District Council, of Vernon Lodge, Chesterfield, was summoned before the Derby county magistrates for driving a motor-car at a speed exceeding

driver, William Smith, of St. John's Wood, was summoned at Bow Street, on Monday, for driving at over twenty miles an hour. The police evidence showed that the car covered a measured furlong at the rate of twenty-six miles an hour. Mr. Y. Drumkey, private secretary to the Sultan, said they went at a very moderate speed except when they were passing two cabs. The Sultan also considered that the speed was not excessive. Smith was fined 40s. and 2s. costs.

FOR using "light locomotives" in the West End of London which did not, as far as practicable, consume their own smoke, several owners of motor-cars and motor-omnibuses were fined in the Marlborough Street Police Court on Tuesday. The general defence was "over-oiling."

AT Beaconsfield, on Tuesday, five motorists were fined £5 each for exceeding the legal limit. Joseph Barberi was fined £3 and 8s. 6d. costs for motoring at thirty miles an hour on the Bath road at Taplow, the chairman (Captain Farwell) remarking that defendant was not so much to be blamed as his employers, who told him to drive home fast because it was raining. The Bench ordered a warrant to issue in the case of Ernest Howard Hargreaves, of Albert Court, Kensington Gore, who was summoned for driving a motor-car at Farnham Royal, near Slough, at a speed of over thirty miles an hour.

## MOTOR-CAR ACCIDENTS.

A MOTOR-CAR accident is reported from Brock, near Preston. Mr. Joseph Eccles, J.P., cotton manufacturer, was cycling along the Lancaster-Preston main road on Saturday night with a motor-car, belonging to Mr. George Burton, cotton manufacturer, following in the rear. A

wagonette was coming in the opposite direction, and after passing this Mr. Eccles cycled along in the centre of the road. The wagonette appears to have obscured the view of Mrs. Taylor, who was driving, and Mr. Eccles was run down. The bicycle was smashed to atoms, and Mr. Eccles was picked up from underneath the motor-car. He sustained serious internal injuries, and, after being removed to the waiting-room at Myerscough Station, was attended by Drs. Roberts, Garstang, and Brown, Preston. The police and others later placed the injured man upon a door, and he was conveyed to his home, Myerscough Hall, where he was found to be in a critical condition.

A MOTOR-CAR accident occurred on Tuesday afternoon at Friston Hill, about four miles from Eastbourne. The car, which is one used by a local company for making short country drives, contained Mr. and Mrs. Metters, of Stratford-on-Avon, and their daughter. While descending the hill the automobile got beyond the control of the chauffeur, and at the foot of the declivity it dashed into a wall, all the occupants being pitched into the roadway. Miss Metters was terribly injured, and died shortly afterwards. The parents were very badly cut and bruised. They were removed to the hospital at Eastbourne. The driver escaped with a shaking, and the car was smashed to pieces.

THE first accident with motor-buses since their introduction into Nottingham was attended with fatal results on Monday. A labourer named William Epison, age about sixty, of Windmill Street, stepped off the pavement in Southwell Road, in the direct track of the vehicle. He was knocked down, the wheels passing over his head and killing him instantly.

### WATERING ROADS WITH CALCIUM CHLORIDE SOLUTION

IN connection with the use of calcium chloride for the prevention of dust on the highways, the following notes by Messrs. Brunner, Mond and Co. will be of general interest:—

The solution used for watering is made by dissolving 1 cwt. of calcium chloride in 100 gallons of water. A road to which calcium chloride has not previously been applied should be watered thoroughly twice over with this solution, an interval of one day being allowed to elapse between the first and the second watering. For 100 yards of road eight yards wide, i.e., for 800 square yards, about 600 gallons of the solution will be required, about 300 gallons for the first watering, and another 300 for the second. For this distance 6 cwt. of calcium chloride will be required, costing about 9s. This will probably last for a minimum period of three weeks or more, according to traffic, quality of road, etc. For subsequent treatments one thorough watering should suffice each time.

To extract the solid calcium chloride from the drum, the latter should be hammered all over with a heavy sledge-hammer, whereby the contents are broken up as well as the drum and can be removed in lumps; or the metal of the drum can be cut open along the seams and the calcium chloride broken up after the metal is removed from it. The solid calcium chloride after the drum is opened will gradually liquefy and should therefore be put into a water-tight tank to prevent it running to waste if it has to be left unused for some time. To make the solution in the watering cart, take the required weight of calcium chloride broken into pieces about the size of a fist, and put it into the cart before adding the water. Then fill up with water and wait until it is all completely dissolved. Stirring greatly facilitates the solution. The solution in the cart should always be stirred up before watering.

### MOTORIST v. MOTORIST.

A CLAIM for £25 3s. 10d., being damages to a motor-car sustained in a collision with another car on the road between Ripley and Guildford, was brought by Mr. Cowley Lambert, J.P., of Womersley, against Mr. Edward Hudson, at the Guildford County Court, before his Honour the Hon. Arthur Russell. There was a counter-claim for £50, which was subsequently amended to £50 7s. Plaintiff's counsel explained that the action arose from a collision between two motor-cars between Guildford and Ripley, on February 9th, about 8.45 p.m. The actual spot of the occurrence was 2½ miles from Guildford. Plaintiff's chauffeur was driving his car from London. At the point where the accident occurred the road curved slightly, and as plaintiff's chauffeur rounded the curve he kept well to the inside—his proper side—of the road. Defendant's car was approaching from the opposite direction, and was coming on at a very fast rate and on the wrong side of the road, viz., the inside of the curve. After hearing the evidence his Honour said he could only find for plaintiff, and say that defendant was responsible for the accident. The people who saw the collision were unanimous that it was defendant's fault, and judgment would be for plaintiff on the claim and counter-claim.

### A SECOND ACQUITTAL.

LORD VIVIAN CRICHTON-STUART, of the Scots Guards, has been summoned at Chertsey for driving a motor-car at an illegal speed on May 7th. A previous summons had failed because the police could not prove identity as to the defendant being the driver of the car. Inspector Jarratt, of the Surrey Constabulary, said the pace was thirty-five miles

an hour at the bottom of Egham Hill. Sir Charles Walpole, chairman of the Bench, said defendant had not been identified as the person who drove the car, and the case would be dismissed.

### PUBLIC MOTOR SERVICES.

A MOTOR-BUS service is about to be established between Caistor and Grimsby by Messrs. J. W. Eason and Company, of the latter town.

At Chester Town Hall Council, two memorials, one signed by 396 residents of Liverpool Road, Garden Lane, and district, and the other signed by members of the Bache Golf Club, have been presented in favour of establishing a service of motor-buses. The matter has been referred to the Tramways Committee for consideration.

It is being generally conceded that the rivalry of motor-bus drivers in London approaches the maximum of keenness in the Walworth Road, where, the Rev. A. W. Jephson declares, motor-bus racing appears to be the normal condition of things.

A MOTOR Pleasure Company for Blackburn and Accrington is being projected, the idea being to own and hire out motor-buses and other vehicles to picnic parties, &c. The first meeting was held in the former town, and the second took place in Accrington on Wednesday.

SUBSCRIPTIONS are invited for 5,680 five per cent. cumulative preference shares of £10 each in the London Road-car Company, Ltd. which has a capital of £700,004, of which £444,000 has been issued and paid, and a 4 per cent. debenture issue of £150,000. Contracts have been entered into for delivery of a large number of motor vehicles and the company considers that it should by the end of the present year be in possession of about 260 motor-buses. The company's assets total £715,655, of which horses, horse cars, vans and harness (decreased since the 31st December last) account for £264,283, and motor-cars and equipments, including cars in course of construction (since increased) for £58,193.

THE first of the motor-buses provided by the Manchester Corporation has made a trial trip through the southern suburbs with a party of the members of the Tramways Committee.

### POLICE TRAPS.

RUMOURS of a police trap at Church End, Finchley, are current among metropolitan motorists.

BETWEEN Little Berkhamsted and Aston Clinton, on the Aylesbury road, is a measured distance with policemen at each end.

THE removal of Inspector Jarratt from Egham to the Reigate division is among the probable early changes in the Surrey Constabulary.

ONE trap alone has just resulted in the capture of eighteen motorists, who have been fined to the extent of £50 at the Guildford County Bench.

MOTORISTS have need of care in driving on the Ayr and Maybole road.

A MEASURED distance in the Bayswater Road, W., is still being used by the police for the capture of motorists.

FOUR motor-car drivers were summoned at Willesden for exceeding the speed limit in the Edgware Road, near Hendon. Lord Hampden wrote to the court suggesting that the police-trap on which his driver was caught was not at a fair spot. With this view the magistrate agreed, suggesting to the police that a long stretch of straight road should not be selected, but a spot where speed would be dangerous.

IN the East Parade, Harrogate, the police have been watching motorists at the point where four or five cross-roads meet.

### TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

Photographers, both professional and amateur, are invited to send photographs of current events or of motoring scenes and incidents. The fee, if any, required for reproduction should be stated in each case; otherwise no liability will be accepted.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

# THE Motor-Car Journal.

VOL. VIII.]

LONDON, SATURDAY, JUNE 9, 1906.

[No. 379.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

## COMMENTS.

OUR illustrations this week further emphasise the part that the motor-car is playing on the racecourse. Danny Maher, the jockey who won the Derby, recognises that however speedy the horse may be on the racecourse the motor-car is quite fast enough for progression on ordinary roads. Both on Derby day and at the Oaks automobiles of every kind predominated, from the small motor-bicycle to the modern 'bus. It is now five years ago since the King set the fashion of going to the races by motor-car; now at Epsom, Newmarket and other racecourses the provision of special automobile enclosures for the accommodation of the cars of their patrons is becoming recognised as an essential feature. Our picture on another page faithfully depicts how completely the motor-car has taken possession of the public fancy.

### The Ubiquitous Motor-Car.

WHEN the motor-car becomes the fashionable vehicle on Epsom Downs, and motor-buses carry silk-hatted passengers to the Derby, no more need be said to prove the position that the automobile has won as a means of public convenience and conveyance. Now comes information from the authorities of the Royal Horse Show at Richmond that the enclosure for motor-cars has been much enlarged, and that not only will opportunity be afforded for accommodating a large number of vehicles, but a specially good position has been allotted to automobilists attending the horse show in the Old Deer Park.

### The Irish Trials.

It cannot but be regarded as unfortunate that the Irish automobile trials about to be held will be overwhelmed by the fact that the Scottish trial will be in progress at the same time. Moreover, some misunderstanding has arisen with regard to the details of the contest in the Emerald Isle which were calculated to prevent the smooth organisation of the event. This has been dispelled by the letter which Mr. G. White, hon. secretary of the Irish Club, has issued. The use of the word "amateur" was the cause of all the discussion, and Mr. White is able to point to the number of motorists who are entering in both sections to refute the suggestion that attempts have been made to institute distinctions of social standing. Now that this has been cleared up it is to be hoped that the Irish trials will be as successful as the Scotch contest is likely to be.

### The Census of Industry.

ALL who have discussed the relative proportions of the British and the foreign motor-car industry will be interested in Mr. Lloyd-George's Bill for taking an industrial census in 1908 and in future years as may be arranged. The persons required to make returns include the occupiers of factories or workshops, and every person who, by way of trade,

gives out work to be done elsewhere than on his own premises. Elaborate precautions are promised to secure that the information thus obtained shall be kept closely under Government seal; but the general results will be of importance to those engaged in controversy or discussion. We know, from the Board of Trade returns, the value of the motor-cars imported into this country, and also the aggregate of the exports, but no returns are available as to the actual home production. Many estimates have been published, and some of the "guesses at truth" have been amusing; but this new inquisition will be the first really official contribution to the actual value of the industry of the country. The statistics of the 1908 and the succeeding inquiries should provide useful data on which to base a comparison of the state of business on the home account.

### Motor-cars in the London Parks.

SOME surprise has lately been expressed with regard to the notices posted in certain of the London parks and open spaces limiting the speed of motor-cars travelling therein to eight miles per hour. The particular case of Finsbury Park is mentioned by a correspondent, who has just seen the injunction for the first time. We are able to say that this is quite within the power of the London County Council, that body having decided that motor-cars can be legally brought within the bye-laws which were made in 1902. Under these bye-laws several offences were specified, one being the "drawing, driving, or propelling at a rate exceeding eight miles per hour, or so as to endanger the public . . . any gun or gun-carriage, carriage, van, velocipede, bicycle, truck, wheelbarrow, or vehicle." Under that clause the legal limit for motor-cars allowed by law, but not always permitted by the police, can be reduced, and motorists will not concern themselves with the restriction to any great extent.

### In Rhodesia.

DR. APPELYARD recently lectured on motorism before the Guild of Culture at Salisbury, Rhodesia, more particularly with regard to its application to that colony. He frankly admitted that if an individual or syndicate imported a few steam wagons and a motor-car for transport, passenger and mail service, say, to the centre of the Mazoe district, even with five times the traffic available, it could not be a success. In the first place, it was just as necessary to have a road to run mechanical vehicles over as it was to have an iron road for railway transport. A road should have a bed and a surface, and should be protected from rains by adequate drainage, while bridges should be thrown over rivers and spruities. As far as he could make out, many South Africans had no conception of the word "road," and asked of what use a road would be in the rainy season, whereas in the rainy season it should be better, being free from dust. As culverts obviated irregularities on the railway line, even to a greater degree would irregularities be avoided between Salisbury and Mazoe. Another reason why this mode of transport was impracticable was the absurd cost of fuel, petrol costing from 5s. 6d. to 6s. 6d. a gallon. Two difficulties which should be removed were the heavy railage and the 10 per cent. duty. To take full advantage of the vehicles a scheme should be

devised by which the principal districts could be connected with the towns and centres on the railway.

#### Motor Transport in South Africa.

THERE is something like consternation among owners of horse wagons which have hitherto been engaged in transport work in South Africa. The success of the motor haulage engine has been so satisfactory for this service that we hear in one particular instance forty or fifty wagons of the old type have been displaced by the motor-lorry. Unfortunately the same prejudice which was evidenced in this country at the beginning of the last century seems to be prevalent in some of the country districts, and when halts are called for the night constant watch has to be kept lest the attentions of the farmers should be too antagonistic. The fact that some of the local authorities are contemplating the maintenance of some sort of systematic management of the great trunk roads is significant of the position motor haulage has gained in that country, and the recognition of its importance to the future development.

Danny Maher, the American jockey, who rode the winning horse in the Derby last week, is also an enthusiastic motorist. Our illustration depicts him at the wheel of his Thomas car, an American vehicle built by the E. W. Thomas Motor Company, of Buffalo.

#### Technical Instruction.

VERY satisfactory is the progress that the automobile education movement is making among the technical and engineering institutes throughout the country, and since we began to chronicle the organisation of classes for such instruction many really useful developments have taken place. The Manchester School of Technology is purchasing motor-car engines and frames for experimental purposes; the Regent Street (London) Polytechnic is extending its equipment with a view to greater completeness, and other institutes, like that of the Great Eastern Railway Company at Stratford, are showing considerable acumen in the methods and means of instruction—all of which is to the national advantage.

#### Practical Work.

WHILE referring to the courses of instruction in public institutions we may usefully draw attention to another enterprise now being developed by Mr. Eustace H. Watson, whose advent to the London motor trade has been distinguished by some innovatory methods based on sound judgment and good performance. He has now, in connection with the London depot for the Argyll cars, opened a special department for the purpose of instructing owners and drivers in the mechanism, construction,

and driving of cars, Mr. C. W. Higgs—who has already won distinction at one of the London polytechnics—having been appointed lecturer and demonstrator. Elsewhere we give further details of the scheme, and would here remark that this combination of business and knowledge has much to commend it to the public.

#### Books and the Car.

BOOKSELLERS are complaining that their lot is becoming less happy and decreasingly profitable. On the one hand they have the vigorous competition of old-fashioned journals which have suddenly become modernised beyond recognition and find vent for their energies in a book-shop; on the other is the apathy to study and reading which they place to the account of the motor-car. The automobile, they declare, draws its votaries from those who previously studied guide books and purchased a stock of fiction and other literary provender with which to beguile themselves when on holiday. Now the route map has supplanted the learned local historian; and holidays are such whirligigs that no time is found for the reading of books. Haste, scurry and bustle have destroyed the old taste for reading—and the bookseller, departing from the dignity of Victorian days, places a stall outside his shop and bewails the passing of his customers, by motor-car.

#### An Open-Air Pleasure.

THIS is one of the effects of increased facilities for rapid transit. It is probably true of those who motor "for motoring's sake," and they are not the majority of owners of cars. When the number of motorists could have been counted in scores and dozens, it may have been true that a large proportion simply revelled in the joy and exhilaration of the new locomotion. But we have advanced a stage further, and the majority of those on cars use them for the legitimate purpose of travel, whether for recreation or business matters not for the purpose of the argument. And although possibly the motor-car is responsible for a great deal more time being spent in the open air than was formerly the case, we are not willing to accept the view which some booksellers have assigned for lessened revenue.

#### Books for Motorists.

IN fact, the motor-car is becoming productive of books—some of which successfully aim at becoming literature, others of which fail in that aspiration. "The Happy Motorist," by Mr. Filson Young, belongs to the former class, and furnishes an instance of technology made popular. Now "The Black Motor-car" comes to thrill our nerves as we glance at pictures of axes whizzing past cars, pistols pointed at the heads of persons, dead bodies floating in the water, and wrestling matches in fearsome earnest. Around these illustrations Mr. Harris Burland has woven a very striking story, published by Mr. E. Grant Richards. Of a more serious character is the Badminton volume on Motoring, which has attained the dignity of a fourth edition, in itself a reproof to those who believe in the motorist's apathy with regard to reading. This has become recognised as a standard work, likely to attract the wealthy sporting man to a realisation of the delights of motoring, and to interest the motorist who takes a delight in the history and progress of the automobile.

#### A Technical Book.

So much for the general literature of the automobile. Of a more technical character is such a work as Mr. E. W. Walford's "Practical Motor-Car Repairing," which has been included in Messrs. Percival Marshall and Co.'s series of Practical Manuals. This is likely to be of service to motor-car drivers or agents, a very useful chapter being that in which Causes and Effects are tabulated in a very comprehensive fashion.

We do not necessarily advise the driver to carry such a book with him for roadside reference, but it is, nevertheless, one of the little volumes that should be on the bookshelf which every fully-equipped garage possesses.

### The "Infernal Machine."

REALLY the motorists in the House of Commons must look after Mr. Galloway Weir, whose language with respect to automobiles is hardly decorous and certainly not correct. When the Home Secretary, before the House rose for the holidays, told this redoubtable questioner that there was no power to suspend the registration of motor-buses whose drivers worked long hours a day, the Scottish M.P. wanted to know whether "some action cannot be taken with regard to these 'infernal machines'?" Why he should thus describe the harmless, necessary motor-car we know not, but that he has always shown a desire to denounce these vehicles is plain to all familiar with the proceedings of Parliament, and the Parliamentary motorist should see to his automobile education without further delay.

### A New Suggestion.

A SUGGESTION of the General Purposes Committee of the Levenshulme District Council has the merit of novelty. The minor body adopted a resolution which has now been approved by the parent authority to the effect that the revenue derivable from any further taxation of motor-cars—as though such a proposition was equitable and passable in the Houses of Parliament—should be devoted to "the reduction of the damage suffered by the residents on roads, particularly shopkeepers." This is a strange way of stating the case, and it is just a bit doubtful if it implies exactly what was meant. Probably that is true of the resolutions of many of the local authorities throughout the country.

### The Loss of a Dog.

THERE is mourning in Uxbridge over the loss of a "beautiful Manchester terrier which was accidentally killed" in the High Street of that Middlesex town a few days ago. He was an intelligent little creature; "for nine years he was a devoted companion and protector, and was an incomparable

Motor Cars and Buses at the Derby.

### Leaving the Car.

WHEN the Bench disagrees motorists sometimes obtain justice—a rather unique experience which has just happened at Hove. A Kensington doctor motored to Brighton visiting a friend or a patient—the details are not sufficiently explicit to warrant an assumption on that point—and leaving his motor-car in front of the house. According to the police this was not the proper thing to do, although they would have been equally offended had he created a commotion by trying to get it into the house. He was summoned before a full Bench of magistrates, and, although the police could not say that there was any actual obstruction, they pressed for a conviction. Mr. J. C. Buckwell, whose interest in motorism was evidenced during the Brighton motor week, contended that the section of the Act under which the defendant was haled before the court did not apply to private carriages, and that the point was as to obstruction of the traffic. The Bench retired and at the end of half an hour discovered that it was a tangled skein beyond their capacity to unravel. They could not agree, and so the victim escaped.

rather. His amusing tricks, year by year, brought him, in the way of 'tips,' an accumulation of pennies which more than covered the cost of his licence." Such is the declaration of his owner, who, seeing that the car which ended his career was branded I O, has written to the County Council of Kildare, asking them to send him a cheque for such an amount as they may deem adequate to compensate him for his loss. Meanwhile his "grief-stricken wife" is having "the dog stuffed at a cost of £1 10s.

### The Local Water Cart.

"THERE is nothing new under the sun," and now in these early years of the Twentieth Era we find up-to-date villages returning to the ways of the ancients of the last century. The residents of Pulborough have purchased a water-cart—not a modern motor machine, capable of doing work efficiently and economically, but a new cart with an old form of locomotion, viz., a horse. Private enterprise has been responsible for this means of watering the roads on dry days, thus preventing, according to a local enthusiast, "the stealthy atoms of dust from

polluting the gentle, invigorating breezes that come floating up from the sea over the swelling downs." So far the local rates have not borne any of the expense of this venture; it is purely the offering of local people, who wish to abate an undoubted nuisance, and a rebuke to the authorities for evident neglect. Few districts possess so many unselfish protectors of the public weal as the delightful village of Pulborough.

#### Tasmania.

SCARCELY a week passes without news of the advance of motoring in the colonies reaches us from readers interested in its development. Mr. A. J. Steele, of Melbourne, and Mr. Bowes Kelly, of Melbourne, have just had a tour through Tasmania extending over three months. They found the roads of very fair construction, although the gradients on some of the main highways are in places rather severe. One of the dangers of travel in the country are the gullies that in some cases are even worse than those of Victoria, as they cannot be seen until the driver is right upon them. Near Hobart the road was full of holes, loose metal lying about like sand on the seashore. Horseshoe nails were almost equally frequent, and the travellers improvised a nail catcher consisting of a light steel dog chain dragging on the driving tyres, an idea which they found very effective.

#### On the Alert.

THE proceedings of important bodies like the County Councils Association should always be watched with some concern by people whose fate—like that of the motorists—is in the balance. At the annual meeting of that association, just held at Westminster, Sir John Hibbert has been drawing the attention of his fellow councillors to the fact that the report of the Motor Car Commission may shortly be expected, and that as soon as its report is issued there should be a thorough examination of its proposals with a view to united action. Granted that this is good advice to the councillors, we would also emphasise its necessity to the motoring community. Surely there should not be much difficulty in bringing about a good feeling between this representative County Councils Association and motorists. The former declares its sympathy for the considerate motorist, and the latter disowns association with the inconsiderate drivers of cars.

#### Belated Delivery.

NOVICES in motoring are slow to comprehend the reason for late deliveries of their cars, and the placing of orders for execution months ahead is a novelty little appreciated by those who have been accustomed to order carriages and cycles for prompt supply. The youth of the automobile industry must be considered; the lack of standardisation of parts that still obtains, and the rush of orders that seems to overwhelm enterprising makers at the beginning of each touring season have all to be considered by the new motorist. Manufacturers, in turn, are often hampered by the short supplies of material, and this has been greatly felt of late with respect to aluminium, the great rise in the price of which has seriously interfered with the calculations of some firms. And this is but one of the factors entering into the work of the motor-car industry.

#### What to do when Arrested.

THE Omaha Automobile Club has adopted a plan which will, it is proudly claimed, obviate the necessity of members being taken to a police station when arrested for violation of the speed ordinances. Each member is to be furnished with a card bearing his name and the number of his machine. On the reverse side is an order signed by the chief of police directing the policeman arresting the bearer to release the automobilist, and to take the card as an assurance for his

appearance in court. Fortunately we have not reached such an advanced stage of anti-automobilism in this country—as yet.

#### The Supply of Horses.

JUDGING from the lugubrious reports which are issued from the great horse repositories, it would appear necessary for motorists to impress upon farmers and horse breeders the commercial wisdom of keeping up the supply of animals. Despite the advent of the motor-car, the value of horses is said by leading authorities to be higher than has been the case for generations, and some firms utilising considerable numbers of horses may be driven to adopt the automobile because of the dearth of horseflesh. It is said that breeding in England is very much on the decrease, and this is one of the causes that has stiffened the prices of horses. Surely farmers must recognise that there are some phases of national life and sport from which the equine will not be ousted for generations to come.

#### Around London.

IN their "Short Spins around London" Messrs. Gall and Inglis introduce us to enough routes to keep the idle motorist busy for a year. Their little guide to North London also comprehends the eastern suburbs, and gives nearly 200 roads, with enticing notes and observations, well calculated to interest the Metropolitan motorist in the unknown delights of the environs of his amazing city. Briefly characterised, it may be agreed that north of the River Thames fine views or breezy commons are not so frequently met with as in the southern district; yet there are delightful views and beautiful scenes to be enjoyed. In the west there is a charming cluster of old-world villages; in the north the low ridges extending from St. Albans to the Lea Valley provide the prettiest section of the routes described in this guide; in the east is Epping Forest and the park-like landscape beyond. The distinctive features of the roadways are well set forth. Towards the western confines of Middlesex the lanes have a tendency to become lumpy; in some of the Essex districts loose shingle is found freely on the road surfaces; in Hertfordshire the highways are almost universally excellent.

MR. E. J. LEE, the representative of the Panhard cars in India, is touring Ceylon with a 35-h.p. car.

THE Coventry Education Committee have sanctioned the establishment of classes in motor-car instruction in that city.

Two years ago Mr. Trackson came from Australia to study the possibilities of motor traction in connection with Colonial development. Evidence of automobile interest then acquired comes with the news of the opening of the City Garage, in Elizabeth Street, Brisbane, by Messrs. Trackson Bros., Ltd.

THERE are 700 shareholders in the Edinburgh and District Motor Omnibus Company, Ltd., which has just held its statutory meeting in London. Chassis to the number of thirty have been ordered, and a contract placed for the erection of a garage giving accommodation for forty motor-buses. Mr. James Morris, who has been identified with the Barcelona tramways, will be running superintendent.

A FEW days ago Mr. H. H. Dixon, the manager of Messrs. Lowe, Bevan and Co., Scotland Street, Birmingham, escorted us through their newly-acquired factory, which is claimed to be the largest works of the kind in the world. The firm's specialities are Cape cart hoods, hood fittings, wind screens, door handles, hinges, general body fittings, locks, catches, bonnet fasteners, handles, etc. Owing to the production of an infinite variety of small articles, a number of separate stores and stockrooms are necessary. The workshops are also very numerous, as the company manufactures each class of goods in separate and distinct departments. The company do a large business in their wind screens, over 1,000 sets having been sold so far this year.

# The Herkomer Trophy Touring Contest.

FRANKFORT-AM-MAIN, Monday.

**A**LTHOUGH the official reception and marking of the cars taking part in the second annual contest for the Herkomer Touring Trophy does not take place until to-morrow, the majority of the competitors have already arrived. No less than 160 entries have been altogether received for the event, as against 102 last year, and although the number of actual starters will be somewhat less than this, the contest promises to be by far the most important of the kind so far held. Its international character may be judged from the fact that the competing cars emanate from no less than eight countries, Germany being represented by no less than eighteen different makers, France by thirteen, Italy by four, Great Britain and Belgium by three each, and Austria, Switzerland, and the United States one each. As regards individual manufacturers, the Mercedes heads the list with 25 entries; followed by the Benz Co. with 16; the Daimler Co., of Coventry, twelve; the Fiat Co., 11; the Opel Darracq

this may unhesitatingly be pronounced a record in the matter of production.

The new 45-h.p. cars comprise a number of novel and interesting departures. The four cylinders, for example, which are each 150 mm. bore by 150 mm. stroke, are, together with their water jackets, cast in one piece, and the crank shaft runs on ball bearings. Two systems of ignition are employed—high tension magneto and ordinary high tension by coil and accumulators. The clutch is of the leather-faced cone type, and of very large diameter. Roller chains transmit the power from the differential shaft, which is below the clutch shaft, to the rear wheels. The frame is of pressed steel, the side members being straight from one end to the other, except at a point towards the rear, where they take an upward and downward sweep to give clearance for the back axle. Other features embodied in the new Daimler 45-h.p. model are the sharp dishing of the front wheels, the placing of the steering bar behind the front axle, the gear

The Fleet of Daimler Cars which are taking part in the Herkomer Touring Contest.

and the Metallurgique ten each; the Adler Co., seven; De Dietrich, six; N.A.G., five; and Martini, four.

Mr. C. Jarrott, who had entered a 40-h.p. Crossley car for the event, is unfortunately prevented from starting, owing to pressure of business, so that Great Britain will be represented by only two builders—Argyll and Daimler. The Argyll Co. have only entered one vehicle; it is of 16-20-h.p., and will be driven by Mr. E. J. Robertson-Grant, who is seen at the wheel of the vehicle in one of the accompanying illustrations. On the other hand, the Daimler Motor Co. have sent over no less than twelve cars, nine of them being of an entirely new model, rated at 45-h.p. The construction of these vehicles was commenced in April last, the last of the cylinders being received from the foundry on the 15th of that month, so that the nine cars have been built, tested, and equipped with bodies in precisely six weeks, the machines leaving Coventry for Germany at the end of that short period of time. Considering that the ordinary output of the company was not in any way interfered with,

driving of the pump from the same shaft as that which operates the magneto, the use of three speeds, whereby a separate lever for the reverse is dispensed with, the sharp rake of the steering column, and the increased size of the gilled tubular radiator.

It says much for these machines that, despite the roads over which they were driven from Rotterdam to Frankfort and the speeds which the cars occasionally attained, not one showed the slightest signs of weakness in the axles. The road from Rotterdam was the same as that along the members of the Automobile Club toured from that city to Frankfort on the occasion of the 1904 Gordon Bennett race. Lord Montagu of Beaulieu was the only owner of a 45-h.p. car who did not make the stage by road, the vehicle being driven by his mechanic. The eight "besitzers" who drove their cars of this type were Captain D. Hughes Morgan, Signor Gigno de Martino, Mr. Charles Hardy, President of the Nottingham Automobile Club, Mr. Arthur Birtwistle, Mr. Robert Stotesbury, Mr. W. Herdman Ash, Mr. Philip Dawson, and Mr. Frank Rendle.

It will be recalled that the three last-named owners figured in the 1905 competition, as did Mrs. Edward Manville, who this year, as last, will be the only lady competitor, and who has such faith in the 35-h.p. Daimler machine with which she beat all rivals in the speed trials, that she is probably the only entrant who will be driving the identical vehicle handled in the former competition. The remaining two Daimler entrants are Mr. A. Griggs and Mr. G. F. Heublein, both of whom are driving 35-h.p. machines. The incidents of the run from Rotterdam were few, but nevertheless interesting. They may be said to have begun when Mr. Hardy discovered that the people landing his car were hauling it ashore by means of a rope attached to the steering column, while a moment later Mr. Rendle's son discovered a petrol vendor pouring white lead into his tank.

The total distance to be covered in the trial is approximately 1,000 miles, the programme of the daily runs being as follows:—

- June 6th.—Frankfurt-am-Main to Munich. 252 miles.
- 7th.—Munich to Linz. 168½ miles.
- 8th.—Linz to Vienna. 115½ miles.
- 9th.—Exhibition.
- 10th.—Vienna, over the Semmering, to Klagenfurt. 192½ miles.
- 11th.—Klagenfurt to Innsbruck. 207½ miles.
- 12th.—Innsbruck to Munich. 94 miles.

During the course of the journey from Vienna to Klagenfurt on Sunday the times of the competing cars will be taken in ascending the Semmering, about fifty miles from the Austrian capital.

Mr. E. J. Robertson Grant, on the 16-20-h.p. Argyll car he is driving in the Harkomer Trophy Touring contest.

The road up this well-known hill comprises a number of sharp turns; it is about 6½ miles long, and has a maximum gradient of 7 per cent. On the last day of the trial the competitors will be required to take part in a flying start speed contest in the Forstenrieder Park, near Munich. The measured distance is over a fairly level stretch about 3½ miles long, a downhill gradient behind the starting point allowing the cars to get up a good speed. It may here be pointed out that by reason of the good performances of the Daimlers in the speed test last year the German Automobile Club has devised a new system of handling the entries, and one that is generally admitted to be the fairest of any so far forthcoming. By this system the cars are started off according to their engine power, the largest going first. For the flat race the officials of the club have plotted a curve on the basis of the speed of a car being in proportion to its horse-power. Thus, if the line at the base of a diagram represents the cylinder capacity in cubic litres and fractions of litres and the vertical line on the left miles per hour, and the results obtained by three cars of varying engine powers over the given course entered at three points on the diagram, it is possible to construct a curve that will give the arbitrary speed to be achieved by a machine of any type over that course. The word arbitrary is used because weight has evidently been taken as a

constant, but, despite this, wind resistance has plainly been considered, for there are two curves, one for open cars and one for closed ones. In this connection it may be pointed out that the Daimler machines with their broad wind shields will be at some disadvantage, for no allowance will be made for the extra displacement due to the fitting of such conveniences. The system of handicapping is nevertheless perfectly fair, and it is not likely that England will be put to any disadvantage, since the system of marking is as follows:—Suppose the engine capacity is such that the speed should be seventy miles per hour and a competitor only does sixty-eight miles, he will have marks deducted for the two miles below what he should have done. If he just does seventy miles he receives no marks whatever for or against, while if he does anything over seventy miles, he receives marks in his favour for whatever he has done over the fixed speed. The same applies to the hill climb, and it is evident that the German officials in marking out their curves have tried courses with cars of different power and fitted with various types of bodies.

Yesterday the Daimler party went for an excursion on the Taunus course to try the cars up the hills and to make sure that they were in perfect running order, despite the fact that they had all come from Coventry without developing the least trouble. The final tuning up trip was a run to and from the famous Saalburg, and developed into nothing more than a picnic. Indeed, everything here is going smoothly, the preparations being in a good state of forwardness.

## SUPPRESSING SEARCHLIGHT GLARES.

REAR lamps are not the only source of irritation in connection with motor-car illumination; the brilliant searchlights which distinguish many cars after dark, to the dazing of other users of the road, are a problem that cannot be said to have been satisfactorily solved until the "Autoclipse" was introduced. This is a device to give a light of ample power, but so arranged that it shall only appear when absolutely needed. Thus on the highroad the space ahead can be effectively illuminated a long way; but when the automobile approaches the town the strong rays can be suppressed, and the journey continued in comfort to the driver and without annoyance to others. This combination of good points has been secured in the Autoclipse, for the introduction of which to this country Messrs. Green and Houk, Ltd., 7, Snow Hill, E.C., are responsible. This lamp lights up the road with two distinct kinds of luminous rays, viz., the long-distance rays, emanating from the back of the flame and thrown into the metallic reflector at the back of the lamp, and the diffused or short-distance rays, produced in the front of the flame and thrown directly on to the lens. In actual practice the former cover the entire road in front of the motorist, searching out distant objects; the latter light up the sides of the road immediately in front of the motorist. It is the long-distance rays which are suppressed by the self-eclipsing mechanism with which the device is fitted. Between the burners and reflectors two black discs have been interposed which prevent the long-distance rays from being thrown into the reflector. The discs are brought into action by a lever at the back of each of the lamps on the front of the car. Both are operated at one operation from the seat by means of a Bowden flexible wire and control lever fixed in any convenient place selected by the driver. The connections are easily detachable when it is desired to clean the lamps, and the system of the Autoclipse seems to present ease of operation and certainty of action, with that instantaneous response to the levers which is necessary to success.

THE other day we had an opportunity of inspecting a new lock-nut which has been devised by Mr. E. Summerfield, of Netley, Hampshire. The device is one of the best of the kind we have seen, and has the advantage that it does not depend on friction for its efficiency.

## CONTINENTAL NOTES.

### The A.C.F. Grand Prix Race.

The ballot for the order of starting took place last week, and gave the following result:—

- |                 |                     |
|-----------------|---------------------|
| 1. De Dietrich. | 8. Itala.           |
| 2. Fiat.        | 9. Gregoire.        |
| 3. Renault.     | 10. Panhard.        |
| 4. Darracq.     | 11. Vulpes.         |
| 5. Brasier.     | 12. Hotchkiss.      |
| 6. Mercedes.    | 13. Clement-Bayard. |
| 7. Gobron.      |                     |

A new departure has been made by deciding that, in place of consecutive numbers, the cars of makers having more than one vehicle entered will bear the same numbers plus letters, as follows:—1a, 1b, 1c, 1a starting 14th, and so on.

### Viewing the Race.

The Sarthe course is much more convenient for spectators than was the Circuit d'Auvergne last year. Those who wish to see the race from the interior of the Circuit will have no difficulty in getting about. Besides the railway from Connerre to Courtalain, and from Mamers to St. Calais, which may be

recent labour troubles, and partly to remove any complaint on the part of the Austrian Club that the races were intended to minimise the importance of the international race in Bohemia in July.

### The Rochet-Schneider Cup Contest for Touring Cars.

The annual competition for the Rochet-Schneider touring-car trophy was held on Monday last over the 1905 Gordon Bennett course in the Auvergne, the distance covered being 300 kilometres. The event is open to four-cylinder touring cars, and the awards are made on a point basis, marks being awarded for regularity of running, consumption of fuel and water, speed on hills, average speed, and price of chassis. Nineteen cars started, they comprising two Peugeots (the holder of the cup), four Rochet-Schneders, a Brouhot, two Clement-Bayards, three Heralds, two Mieussets, three La Buirens, and two Pilains. Seventeen of the competitors succeeded in completing the journey, the victory lying with M. Perret (Peugeot), who has now won the contest two years in succession.

### The Mont Cenis Hill Climb.

The annual Mont Cenis hill-climbing competition, organised by the Turin Automobile Club, is to be held on July 16th next.

Erecting the Grand Stands on the Sarthe Circuit in Preparation for the A.C.F. Grand Prix Race.

utilised, there are broad roads in excellent order in the vicinity of the course, which will enable spectators to get to and from the most interesting points. In the triangle formed by the circuit there are several small towns where supplies of all kinds can be obtained. On the outside of the Circuit a frequent service of trains will be available between Le Mans, the principal town in the district, and La Ferté-Bernard.

### The Labour Troubles in France.

Following on the settlement of the labour troubles in the Paris district, the men employed by Messrs. De Dietrich and Co. at Luneville have now resumed work. Messrs. De Dietrich feared they would not have their racing cars ready for the Grand Prix, but by employing a double shift of special men it is hoped that they will be finished in time.

### The Motor-Cycle Championship Races.

The Motor-Cycle Club of France has decided to postpone the motor-cycle championship race from June 17th to September 2nd or 9th next. The decision is partly due to the inability of manufacturers to get their machines ready in time owing to the

The contest will be divided into a number of classes as follows:—1, cars from 650 to 1,000 kilogs; 2, cars from 400 to 650 kilogs; 3, motor-bicycles under 50 kilogs; and 4, public service vehicles having accommodation for twelve persons. The trial is over a 23 kilometre course extending from Susa to Mont Cenis. A large number of prizes are being offered in connection with the event, entries for which should reach the A.C.T., Via Bogino, Turin, before June 25th.

### A German Motor-Cycle Reliability Trial.

Owing to several provincial authorities refusing their permission, the idea of a motor-cycle reliability trial over the Herkomer Touring Trophy circuit has had to be abandoned. In its place it is proposed to hold a three days' event in July over a circuit in South Germany, which, starting and finishing at Munich, takes in Stuttgart, Karlsruhe, Frankfurt and Nuremberg.

### An Austrian Light Car Competition.

An interesting light touring car competition was held on the 12th and 13th ult. by the Austrian Automobile Club. The

trial consisted of a run from Vienna to Graz on the first day and back to the capital on the second, a total distance of 256 miles. The competitors were divided into two classes: 1, single-cylinder cars, which were required to maintain an average speed of fourteen miles per hour; and 2, double-cylinder vehicles of which an average of seventeen miles was expected. Altogether there were twenty-five starters, comprising four each De Dion, Opel-Darracq, and Laurin-Klement, two each Clement Bayard, Peugeot, Ultramobile, Piccolo, and Scholley, and one each Maurer-Union, Thein-Goldberger and Bolide. Of these twenty-one succeeded in making the round journey, the first place in Class 1 being taken by a 9-h.p. four-seated De Dion, driven by Herr R. Siercke, the winner of Class 2 being Herr Bleiweiss on a 10-h.p. Peugeot.

#### The Tour de France.

The tour of France organised by the Auto-Cycle Club de France, which commenced on the 22nd ult., ended on Sunday last. In our last issue we left the competitors at Marseilles. On the 28th ult. the run was to Avignon (100 miles), on the 29th to Lyons (140 miles), on the 30th to Besancon (134 miles), on the 31st to Nancy (121 miles), on the 1st inst. to Rheims (122 miles), on the 2nd to Amiens (115 miles), and on the 3rd to Paris (90 miles). The journey from Marseilles to Avignon comprised the climb up Mount Ventoux, the best time being made by Barriaux on a Vulpes car. Of the thirteen

The 20-h.p. Vulcan Landulet recently supplied to Lord Lytton by the London and Parisian Motor Company, Ltd.

motor-bicycles which started, eleven finished; of thirteen tri-cars, eight survived the contest; while all the four voituresses successfully completed the long trial. The tri-car section was a victory for the Austral concern, the trio of vehicles entered by them carrying off the first three places. Contant, on an Aleyon, took the first place in the light motor-bicycle class. Cissac, on a Peugeot, headed the list of the third of a litre motor-bicycle category. As for the four voituresses, the Vulpes, driven by Barriaux, and the De Dions of M. Pellisson and M. Pellegrin tie for first place, none of them having lost a single mark. M. Grillet's Fouillaron was close behind, having lost only two points.

#### Miscellaneous Items.

The Belgian Automobile Club is about to make some trials in the Bois de la Cambre, Brussels, with a new dust-preventing preparation, known as Barnite.—Some further trials with motor-cycles and motor-cars are to be made in the forthcoming military manoeuvres in Belgium.—An 18-h.p. Panhard, fitted with ambulance body, has just been added to the fire brigade equipment in Paris.—Prince Eugene of Sweden has just placed an order for a 40-h.p. Benz car.—The Italian Automobile Club has selected two Itala and three Fiat cars to represent Italy in the Vanderbilt Cup race.—Three Puck machines will constitute the Austrian team in the forthcoming international motor-cycle race.

### SCOTLAND AND THE TRIAL.

THE programme of the Scottish Reliability Trials of next week provides for the cars starting each morning at seven o'clock, except on the last day, when Pitlochry will be left at 6 a.m. The following time table will be of interest to Scottish readers.

Wednesday, leave Glasgow from	7 a.m.
" pass through Ayr after	8.45 a.m.
" " Dumfries after noon.	
" " Moffart after	2.5 a.m.
" " Peebles after	4 p.m.
Cars arrive in Edinburgh after 5.10 p.m.	
Thursday, leave Edinburgh from	7 a.m.
" pass through Stirling after	8.50 a.m.
" " Perth after	10.35 a.m.
" " Blairgowrie	11.25 a.m.
" " Braemar	2.15 p.m.
and may arrive in Aberdeen after 5.10 p.m.	
Friday, cars leave Aberdeen from	7 a.m.
" pass through Huntly after	9 a.m.
" " Tomintoul after	11 a.m.
" " Grantown-on-Spey after	11.5 a.m.
" " Kingussie after	2.10 p.m.
and may arrive in Pitlochry after 4.30 p.m.	
Saturday, cars leave Pitlochry from	6 a.m.
" pass through Killin after	8.40 a.m.
" " Inverary after	11.10 a.m.
" " Arrochar after	1.25 p.m.
and may arrive in Glasgow after 3.30 p.m.	

PITLOCHRY will have a busy experience during the week of the Scottish Trials, which start on the 13th inst. Two days before the Auto-cycle Club's run to John o' Groat's will commence, and on the day that the cars will start from Glasgow the motor-cycles will arrive at Lockerbie; on the 14th the latter will reach Pitlochry, starting the next morning for Tain. On that day the cars will arrive at Pitlochry from Aberdeen, so that the beautiful little town will be awakened early and late with the toot of the motor horn.

FOR the benefit of those southerners who will be in Scotland during the forthcoming Trials we give below the letters of identification for the various Scotch counties and boroughs. We shall be pleased to send a copy of the M.C.J. complete identification card to any reader making application during the next few days:—

A S Nairn.	S K Caithness.
B S Orkney.	S L Clackmannan.
D S Peebles.	S M Dumfries.
E S Perth.	S N Dumbarton.
G Glasgow.	S O Elgin.
H S Renfrew.	S P Fife.
J S Ross and Cromarty.	S R Forfar.
K S Roxburgh.	S S Haddington.
L S Selkirk.	S T Inverness.
M S Stirling.	S U Kincairdine.
N S Sutherland.	S V Kinross.
O S Wigtown.	S W Kirkcudbright.
P S Zetland.	S X Linlithgow.
R S Aberdeen (T.C.).	S Y Midlothian.
S Edinburgh.	T S Dundee.
S A Aberdeen (C.C.).	U S Govan.
S B Argyll.	V Lanark.
S D Ayr.	V S Greenock.
S E Banff.	WS Leith.
S H Berwick.	X S Paisley.
S J Bute.	Y S Partick.

It should be remembered that "S" occurs only in Scotland, and that the only Scotch places in the identification mark of which the S is not used are Glasgow (G) and Lanark (V).

THE War Office Mechanical Transport Committee have appointed Majors Lindsay Lloyd and Donohue to represent them at the forthcoming trials.

APPLICATIONS for the licensing of three motor-cars and drivers to conduct a regular service of cars between Stirling and Bridge of Allan have been made at the Burgh Police Court. It was agreed to continue the applications in order that the magistrates might have an opportunity of considering as to necessary regulations.

# The Adams-Hewitt 10-h.p. Car.

WE lately had an opportunity of making a trial run on one of the Adams-Hewitt cars built by the Adams Manufacturing Co., Ltd., in the new works they have lately established at Bedford. A few brief particulars of the vehicle have already been given in the *M.C.J.*, but the design is so different from the usual practice in Europe that the more complete description we are now able to publish may not be without interest. Generally speaking, the car very closely resembles the type made familiar by the Cadillac and Ford vehicles, the idea of the builders being to combine the good points of the American design with British workmanship. The engine, which is of the horizontal single-cylinder type,  $4\frac{1}{2}$  in. bore by 6 in. stroke, is assembled on a pressed steel frame mounted on the longitudinal springs. The inlet and exhaust valves are of large diameter, and are mechanically actuated off a single cam shaft. The water circulation is maintained by a chain-driven pump and ribbed-tube radiator.

The mixture is furnished by an automatic carburettor, so that the usual air lever is dispensed with. There are two air inlets—one is fixed by a screw, but can be varied; the other contains an automatic shutter, so as to vary the air according to the speed of the motor. The entire volume of air entering the fixed aperture rushes past the jet, while that admitted by the automatic inlet mixes with the petrol vapour above the jet. The latter is so arranged that it can be quickly removed for cleaning purposes. The normal speed of the engine is 1,000 revolutions per minute. It can, however, be regulated by a throttle valve, controlled by both hand and foot levers. The hand lever can be set at any desired point for normal running, the pedal being used to give any temporary acceleration of speed. The consumption of petrol is stated to be equal to from twenty-five to twenty-eight miles per gallon. The standard cars are provided with high-tension ignition by coil and accumulators. Provision is, however, also made for fitting a low tension magneto, driven by a chain off the engine shaft. The make and break mechanism is so arranged that it can be readily adjusted. An interesting and ingenious feature of the ignition is that no switch is provided, the current being cut off by the advance and retard lever both when in its extreme lowest and highest positions, the wiper spring then ceasing to act on the sector of the contact maker.

The engine is lubricated by means of a multiple force feed pump, which consists of four separate pumps, one for each place to be lubricated, the amount of oil pumped through being automatically regulated to suit the speed of the motor. The oil is contained in a tank ingeniously formed in one with the top cover of the crank case; it is thus maintained at a high temperature,

and therefore flows freely through the pipes. The tank, which has a capacity sufficient for from 400 to 500 miles, is provided with a gauge to show the level of the oil. The motor is set about the centre of the car and right under the body; it is, however, easily accessible, as by slackening two finger nuts the entire body can be lifted up. The valves can be reached without interfering with the body, if necessary, by opening the back, while there are doors at each side which also give access to the motor.

The change-speed gear is of a special epicyclic type mounted on an extension of the crank shaft. Two forward speeds and a reverse are provided by the mechanism; the gear wheels, which are five in number, are externally cut and are always in mesh. The two speeds forward and the reverse are brought into operation by bands acting on drums. There are three pedals arranged on the footboard side by side. When the central pedal is operated the band next the fly-wheel tightens on its drum, and the drive is then taken through the sun and planet system, thus giving the low speed. When the left pedal is operated it at once releases the central one and presses a cone, placed on the outside of the gear, to the left. This forces a system of scissor levers apart, and locks the central band on its drum, causing the epicyclic system to run solid and giving the high speed. The control of the car is thus greatly facilitated, as the driver has only to press down the desired pedal, when any of the others which may be in operation are instantaneously released. An excellent feature of the change-speed gear is the possibility of rapidly reversing the direction of motion by the simple movement of the right hand pedal. When this is pushed forward the brake on the change-speed gear shaft is first

Fig. 1.—General View of Adams-Hewitt Car.

applied, and when pressed further, it brings the reverse into operation. Should the car begin to run backwards the low speed pedal acts as a brake, and if the driver keeps one foot on the central pedal and the other on the right pedal, and operates each alternately, the car will at once respond, moving backwards and forwards alternately. This is of great advantage when in thick traffic, where one has always to be prepared for the vehicle in front suddenly backing. Ample brake power is provided, as, apart from the pedal-operated one referred to above, a hand lever is provided, which controls expanding brakes working inside drums connected with the hubs of the rear wheels. From the change-speed gear shaft the power is transmitted by a single centrally-located chain to the rear live axle.

The chassis is being provided with several different patterns of bodies. The two-seater can be equipped with an emergency seat at the rear, and, fitted with hood and front glass, is well adapted for doctors' use; a small brougham, landaulet or cab body is also being made, while the latest production is a double

phaeton. The latter forms an excellent light touring car, with ample accommodation for four passengers. The chassis is of the standard type, except that the wheel base has been slightly increased. A useful light delivery van designed to carry loads of 10 cwt. at speeds up to ten miles per hour is also being turned out, to meet the growing demand for industrial vehicles. The bodies of the cars are suspended on a special framework having a three-point suspension and entirely separate from the main springs which carry the engine and transmission, no vibration due to the pulsations of the latter or from the inequalities of the road surface being transmitted to the passengers. The longitudinal springs, which run parallel along the length of the car, are free to slide at the rear ends, while strong radius rods, which extend from the back wheel brake drums to brackets attached to the springs, enable the rear axle to be moved backwards, and the tension of the chain adjusted. The axles are of tubular construction, and the bearings on the same are of the conical roller type. The standard car has a wheel base of 6 ft. 8 in. and a track of 4 ft.

Fig. 2.—Elevation and Plan of Adams-Hewitt 10-h.p. Car.

2 in. All parts are made on the interchangeable system, so that replacements can be readily obtained and fitted in position.

In the course of the trial run already referred to we had ample evidence of the quiet and easy riding qualities of the vehicle, the engine being exceedingly silent and steady in its operation, a feature which is largely achieved by the heavy fly-wheel fitted, the latter weighing 180 lbs. The makers' claim that the car can maintain an average speed of 20 miles over give and take roads, and that any ordinary hill can be taken on the top gear, is one that, judging from our experience, may be safely accepted. In the course of the run the car was called upon to make the inevitable climb up Netherall Gardens, N.W. Not only did it do this with ease on the low gear, but the driver succeeded in doing what he had not attempted before, i.e., stop-

ping and starting on the stiffest portion of the rise. The simplicity of control is undoubtedly one of the strong points of the car, proof of which may be seen in the fact that, without any previous experience, we were able to take charge of the wheel and get on to top speed in less than 50 yards. The foot brake somewhat puzzled us at first, for, being accustomed to keep the brake on by maintaining the pressure on the pedal, we found the car beginning to move backwards. We, however, quickly discovered the secret of working the brake and low speed pedals one against the other, after which no difficulty was experienced. Although, as we have said, the general appearance of the car differs somewhat from what may be termed the present fashion, those motorists whose ideas are not bound down in this respect will find the Adams-Hewitt a reliable and steady running vehicle.

## THE IRISH TRIALS.

ON the same day that the Scottish Reliability Trials will commence from Glasgow the Reliability Trials of the Irish Automobile Club will begin, Dublin being the central point of the event. On Wednesday the run will be to Carlow, a distance of 49½ miles and back, reviving memories of the famous Gordon Bennett race. From the capital the way will be taken to Naas, where the weighing in for the great event of 1903 took place, with M.M. Jenatzy, Gabriel, and others of international renown, attracting universal attention. Thence to Kilcullen, which provided the first dangerous corner of the famous course, and from where the Archbishop of Dublin set forth on his first motor-car trip—a journey on Mr. C. Cordingley's 40-h.p. Mercedes, which occasioned as much comment in Ireland as any other incident of the Motor Fortnight.

On the second day the run will be northward to Dundalk, 51 miles and back; part of the journey, to Drogheda, being along the road taken by the contestants who participated in the hill-climb at Castlewellan, co. Down, and then on the third day will be a run to Gorey, 61 miles away from Dublin, and through a very charming country. This includes the pretty town with the long name of Newtownmountkennedy, goes over the bridge at Ashford—one of the most famous resorts near Dublin—through Arklow to Gorey, a place of rather poor appearance in many parts, though of ancient lineage, possessing some ruins of pleasant attractiveness.

On the 16th the competition will conclude with a hill-climbing competition. The award will be based upon reliability, hill-climbing, and petrol consumption, and it is provided that the general conditions follow the tried and approved lines of such contests.

MESSRS. TOPAN AND Co., of Bombay, have been appointed agents for the Star cars in India.

THE Standard Motor Agency, Ltd., inform us they have just concluded arrangements for their representation in Australia, New Zealand, and Tasmania. Contracts have been placed for a term of years for their six-cylinder cars, and also for the Standard landaulet, which is likely to become very popular in the Antipodes.

MUCH motor-car business is being done by the Automobile Contract Company, Ltd., of 33, Old Bond Street, London, W. The principle of their system is that they supply motor-cars of any make at list price, retaining the trade discount. Therefore a purchaser pays no more when buying his car through this company on easy terms, than if he went direct to the manufacturer. At the same time an increased trade may be done by manufacturers who grasp the fact that not everybody is in a position to pay the whole of the money down for a car. The directors of the Automobile Contract Company, Ltd., are Sir Samuel Scott, Bart., M.P., Mr. C. H. Burnand, and Mr. Sydney Lee. Evidently the company is meeting a want, and many professional men, civil servants and others, are availing themselves of this plan of becoming motorists on terms of easy payment.

A CONFIDENTIAL information bureau referring to the main roads is being established in connection with the Automobile Association.

WE learn that Sir Duncan Hay has just placed an order with Messrs. Mann and Overton's, Ltd., for a 24-30-h.p. Richard-Brasier car.

THE residents in the Revidge district of Blackburn are urging the establishment of a motor-bus service over the hills, and the Corporation has appointed a committee to inquire into the matter.

A CHANGE has been made in the date of the reproduction at the Crystal Palace of the carnival of Nice, in which a procession of decorated motor-cars will figure. This will now take place on July 20th and 21st.

MR. SEYMOUR HICKS, the well-known actor, and Mr. Herbert Sullivan, nephew of the late Sir Arthur Sullivan, have both placed orders with Mr. Graham Notley, of the Waterloo Motor Works, Chicheley Street, S.E., for 20-32-h.p. Darracq cars.

WE illustrate herewith the latest production of Messrs. R. Reynold Jackson and Co.—a 9-h.p. side-entrance car. The vehicle is being equipped with either a 9-h.p. De Dion single-

## HERE AND THERE.

SEVERAL Daimler cars took part in the review of motor-cars, in Madrid, held by the King of Spain on the occasion of his marriage.

MME. Melba motors from Coombe to Covent Garden every evening. On Tuesday a puncture brought the car to a standstill, and the famous singer rode on a pantechnicon to the nearest station.

THE 3½-h.p. Brown motor-cycle driven by R. M. Brice at the Fernhurst hill-climb of the Auto Cycle Club has been awarded the gold medal for the most meritorious performance.

THE inhabitants of Southwold were surprised one recent evening by the arrival of several military men in motor-cars. To one a searchlight was attached, and this was used continuously for several hours.

A LIGHTED match thrown under a motor-car by a chauffeur outside Eton College, on Tuesday, ignited some petrol on the roadway, and caused the car itself to burst into flames, damage to the extent of about £80 being done.

WITH the view of assisting the competitors in the Herkomer touring contest whose cars are fitted with their tyres, the Continental Tyre Company have established twenty depots

Figs. 1 and 2. Two views of the Jackson 9-h.p. Convertible Car.

cylinder engine or a Gnome double-cylinder of equal power. The water circulation is maintained by a pump and combined honeycomb radiator and water tank. The power is transmitted through a leather-faced cone clutch to a gear-box, giving three speeds forward and a reverse, and thence by a cardan shaft and bevel gear to a strong live axle. The details are on model lines, and comprise engine control levers on the top of the steering wheel, push pedals, pressed steel frame, etc. The design of the body is interesting; the entrance to the rear seats is obtained by tilting up half of the front seat, while all are so arranged that they can quickly be removed and the floor boards taken out the whole way from the dashboard to the rear of the car, so rendering access to the gear-box and other parts of the mechanism particularly easy. As illustrated in Fig. 2, by detaching the rear seats and letting down the tailboard the vehicle can be quickly converted for commercial or station work. We may also draw attention to the rounded back seats and spring steel supports, which greatly add to the comfort of the passengers. The car is turned out complete with all accessories, such as lamps, horn, number plates, ready for the road, and in view of its relatively low price is well worth the attention of motorists of moderate means.

along the line of route. Not only will a stock of tyres be kept at these places, but a staff of expert fitters will also be in attendance.

FOR not having the lamps of a motor-omnibus alight, the Police Commissioner summoned the driver of the vehicle at the North London Court, but evidence was given by the company and others that the conductor, not the driver, is in charge and responsible, and Mr. Fordham eventually dismissed the summons on that ground.

THE inauguration of the Argyll Company's new works at Alexandria has been fixed for the 26th inst., when the opening ceremony will be performed by Lord Montagu of Beaulieu. The function will, of course, be an "opening" in name only, as the works have been in operation for several months, the number of men employed now exceeding 1,200.

THERE are now close upon 500 motor-buses in service in the London district, and a sign of the times is seen in the announcement of the Victoria Omnibus Association that, having decided to adopt motor-vehicles, 310 horses and thirty omnibuses are to be put up for sale by auction this week. For a similar reason the New London and Suburban Omnibus Company will dispose of 105 horses and ten buses on Tuesday next.

By the collapse of a motor garage at Frinton, where four teen men were working, several have been injured.

ON Thursday last week Messrs. H. M. Hobson, Ltd., gave a luncheon to a number of members of the Press and friends, the occasion being the inauguration of the large new depot they have established at 29, Vauxhall Bridge Road, Victoria, S.W. Starting some years ago in the cycle business in the City, the firm were among the first to import motor-bicycles into this country, and at a later period entered the motor-car trade, their

The Inauguration of Messrs. H. M. Hobson's New Depot.

first sale being an electrical vehicle to the Sultan of Morocco. Premises were secured in King's Road, Chelsea, with branch works at Wimbledon, and although additions were made from time to time, the development of the business necessitated further extensions, the outcome of which is the new building, which has been specially designed and built to meet their requirements. The premises, which comprise three storeys and a basement, are provided with a large lift, and include a show-room for the Decauville cars, for which Messrs. Hobson are British agents, a suite of offices, a workshop, in which all classes of repairs can be carried out, a stores department, where a large stock of spare parts for Decauvilles is kept on hand ready for despatch at the shortest notice, and rooms for the storage of Jenatzy motor-tyres and Pognon sparking plugs, for both of which the firm hold the agency in this country. Part of the premises is also designed for use as a garage, accommodation for close upon forty cars being available. Altogether the new depot is well equipped and conveniently arranged, and, in view of the careful attention to details for which Messrs. Hobson are noted, bids fair to become a centre of great activity.

AWAY in the little town of Kington, in Herefordshire, Mr. James Fryer has developed a connection among motorists extending far beyond the charming county in which he dwells. He sold his first car in July, 1899, and has consistently and conscientiously acquired a knowledge of new vehicles that now stands him in good stead as an adviser to novices, as well as a help to motorists of experience. Recently he opened a new garage at Leominster, whither the Herefordshire Club paid a visit of inauguration.

THE "Signal" tell-tale for motor-car lamps is an excellent device introduced by the "Signal" Motor Company, of 37, Essex Street, Strand, W.C. It is a simple invention for warning drivers when their tail lamps are extinguished. It operates by thermostatic action, and consists of an electrical contact which is opened by the heat of the lamp flame. Immediately the lamp becomes extinguished this contact closes and illuminates a small electric lamp fixed on the dashboard, thus warning the driver that his rear light has gone out. The device can be easily fixed to any car, and should prove as popular as it is undoubtedly useful.

THE Metallurgique cars have received the highest distinction at the Milan International Exhibition, having been awarded a Grand Prix.

BOTH the Derbyshire and Warwickshire County Councils have lately sanctioned the purchase of automobiles for the use of officers in the surveyors' departments.

A NEW price-list has been issued of the Stepney spare motor wheel, a device favourably known to motorists. It can be fitted to all artillery or wire wheels.

THE Anglo-American Oil Company have made arrangements for the supply of Pratt's motor spirit to competitors and the general public during the Scottish Trials.

ACCORDING to a recently issued consular report 408 motor-cars, valued at £97,800, were last year imported into Canada, as against 362 and £63,400 respectively in 1904.

LORD BRASSEY has just placed an order with the London and Parisian Motor Company, Ltd., for a Hotchkiss limousine similar to the one built for the Duke of Westminster.

MESSRS. KUETTNER, MACDONELL, AND COOKSON, LTD., are garaging electric cars at 37, Endell Street, London, W.C., where they have every facility for the repairing and re-charging of batteries.

No fewer than fifty electric victorias and landaulets have lately been put in service in Buenos Ayres, Argentina. The vehicles, which are intended for public hire, are on the Krieger system, and are fitted with taximeters.

THE Metropolitan Asylums Board have accepted the tender of Messrs. Dennis Bros., Ltd., for the supply of a chassis capable of taking an omnibus body to accommodate eight persons. Mr. L. H. Hounsfield was the engineer consulted by the Board in arriving at their decision.

THE Hitchon Gear and Automobile Co., Ltd., are erecting extensive new works in Charter Street, Accrington, for the manufacture of the Globe motor-car. The works will cover several acres, and when completed will find employment, it is stated, for about 2,000 workmen.

WITH its reproduction of the Ordnance map of the locality and delightful sketches of the country round about Dorking and Leatherhead, the Homeland handbook thereto is a volume of pleasant interest, upon the publication of which the Homeland Association, Ltd., is to be congratulated. It will be of value to the motorist and of service to the antiquarian and lover of architecture.

MESSRS. J. E. HUTTON, LTD., have for some years been studying the best method of supplying the demand for a reliable

light delivery van at a reasonable price, and have recently introduced the 10 cwt. vehicle illustrated herewith. The chassis is of the Panhard three-cylinder 8-11-h.p. standard type. The van bodies are strongly made of best seasoned timber, an extension being fitted over the front seat to protect the driver from the weather. The vehicle is capable of carrying its full load at a speed of twenty miles an hour on level roads, and will ascend any ordinary hill at a good speed.

## SOME CURRENT TOPICS.

## Buying a Second-hand Car.

The uninstructed novice, to whom a car is a car, is liable to be tempted by an apparent bargain, and, though such is to be had, the probabilities are that in the absence of expert advice the result will be disappointing. A few hints as to the points which should be watched in purchasing a second-hand car may,

The notice board recently erected on a piece of land rented by the Automobile Association at the entrance to the village of Buckden, Huntingdonshire, on the Great North Road. The committee of the A.A. applied for permission to place the sign board at the road side, undertaking to defray all attendant expenses, but the Hunts County Council refused same.

therefore, be of interest and utility. The prudence of considering only the vehicles of the few old-established firms will be especially obvious, as, except as a speculation for a man of mechanical tastes, the purchase of more or less experimental and discarded patterns of newer makers will be likely to prove unsatisfactory; while the probable facility of obtaining replacement of worn parts at a reasonable cost should be taken into consideration.

## External Details to be Noted.

The first thing to attract the untechnical critic's eye, namely, the exterior appearance of a vehicle, is, it is needless to say, of little importance; paint and varnish deteriorate rapidly under automobile conditions, and the cost of restoring them is sufficiently well known, as is also that of tyre renewal; but, in the case of solid-tyred cars more particularly, the state of the rims is some indication of the wear they have suffered. The wheels should be examined for truth and correct tracking, while—especially where light vehicles are concerned—a back and front view of the car will show whether any "splaying" or convergence of the tops of the wheels betrays weakness or excessive loading of the axles.

## The Differential Gear.

A trial trip will presumably be forthcoming, and though a single bad performance need not condemn a car—or few indeed would be saved—the owner may be expected to show it, if possible, at its best, and an opportunity will be afforded of noting excessive rattle, jar, or looseness of parts, state of brakes, and hill-climbing powers, which should, if practicable, be tested on gradients familiar to the purchaser. Where ball bearings exist they should, or one of the main ones at least, be inspected for wear, loose cups, etc., and in default of this by spinning, shaking, and so on, when the axle is raised by a jack. The raising of the back axle, so that both wheels are off the ground, will enable some idea of the condition of the differential gear to be gained; when one wheel is revolved the other should rotate in the opposite direction freely and without too much backlash, where

a live axle is in question; where it is on the countershaft there is more difficulty in seeing this, except in cars where its pinions are open to inspection.

## The Change-speed Gear.

The pinions of the change-speed gear should on no account be left unexamined, as their condition is an excellent index to the state of health of the car and the amount of care it has received; the amount of wear on the faces of the teeth is, of course, more significant than the battering of their ends due to careless changing, while looseness of the gear-shaft bearings may be looked for at the same time.

## The Condition of the Motor.

Last, but not least, the engine itself will claim attention. Its compression and tightness in main and piston-rod bearings can usually be tested with the starting handle, though any serious looseness in these will be manifested by a knock when the engine is running; but perhaps the best test of the age and experience of an engine lies—as with a horse—in its teeth, namely, in the state of the pinions of the half-speed or valve-shaft, which should have a fairly long life, and hence are not likely to have been replaced—accidents apart—unless it has arrived at the stage of having a thorough and extensive repair. If these are badly worn, one may safely consider that its mileage has run well into the tens of thousands. In conclusion, it may be remarked that the inexperienced would-be motorist will do well to solicit the advice of some experienced friend in considering the purchase of a second-hand car.

## A Lady's Record.

There are few things more aggravating to the motorist than to be hindered on the road by unforeseen and unpreventable occurrences when the car itself is running well. A combination of untoward circumstances was encountered the other day by Mrs. C. Mitchell, of Huddersfield, when she was engaged in an attempt to beat her husband's record run from Glasgow to Huddersfield, accomplished in seven and a-half hours on a 16-20-h.p. Argyll. One day last week Mrs. Mitchell started from Glasgow at 7.45 a.m. on a car of identical make, and as the

Mrs. C. Mitchell at the wheel of her 16-20-h.p. Argyll Car.

engine was running sweetly and the weather was favourable she entertained high hopes of reducing Mr. Mitchell's time by a substantial margin. However, she had not gone many miles when she discovered that she had taken the wrong road, whereby fifteen minutes were lost. Nearing Carlisle heavy rain was encountered, and at Keighley she ran into a dense bank of fog, which lasted all the way to Brighouse. In spite of these misfortunes Mrs. Mitchell arrived at Huddersfield at 5.10 p.m., her net running time having been 8½ hours—a creditable performance for a lady.

## CORRESPONDENCE

[Letters to the Editor should be addressed to the offices,  
27-33, Charing Cross Road, W.C.]

### OVERHEATING TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I shall be glad if you or any reader of the *M.C.J.* can help me out of the following difficulty. I have a car which would not climb the hills to my satisfaction, so I took the old engine out and put one in of rather more than double the power. To my dismay I cannot subdue the great heat the motor produces. I have bought a new radiator three times larger than the original, and also added a fan to the same with water tank. After running a few miles the whole of the water both in

carburettor. On again trying the car it ran well, but on taking the slightest incline what appears to be popping in the carburettor takes place. The engine runs perfectly when standing or on the flat, but it invariably starts popping directly the motor is slowed by a hill, unless I retard the ignition. If you or any reader of the *M.C.J.* can assist me I should be obliged.—Yours truly,

R. L. MADDOCKS.

[We would advise our correspondent to turn his attention to the ignition for his trouble. A bad "earth" will be found to almost always cause firing back in the carburettor. This can easily be ascertained by connecting a wire from the commutator spindle to the frame and see if better results are obtained. The shaft becoming worn will also cause a bad earth to the commutator. Having had the same trouble with a car we effected a remedy by fixing a connection on the end of the shaft direct to the negative of the accumulator.]

### STEAM CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In answer to Mr. E. Martin, respecting the Locomobile, I may say I have had about as much experience of above cars as any

Touring in Bohemia. On the Mur Bridge at Gratz.

[Allgemeine Automobil Zeitung.]

the tank and radiator begins to boil. The old engine was of 10-h.p.; the new is a 24-h.p. What must I do to overcome the heat troubles?—Yours truly,

F. R. DEAN.

[There is evidently something seriously wrong with the water circulation of our correspondent's car. The fact of increasing the radiator ought to have overcome the difficulty. If a pump is not already fitted we would advise fitting one, also making a thorough inspection of all pipes, etc., in connection with the circulation, to see that all is clear. It would also be advisable, if the engine is new, to thoroughly examine the water jackets, as sometimes the sand is not properly cleaned out after the cylinders are cast. If this were the case it would cause a great deal of over-heating.]

### POPPING IN THE CARBURETTOR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have a 12-h.p. two-cylinder car which ran perfectly till last week, when I noticed it commenced to run jerkily. On my return home I cleaned the sparking plugs, adjusted and cleaned contact breaker, took out and ground the valves, and cleaned out the float chamber of the

private owners. First of all there is the same trouble with the Locomobile as other cars. It takes fifteen minutes to get steam up. I use a cheap brand of Bowley's petrol, twelve miles to the gallon. My tank has a capacity sufficient for twenty miles. I can attain a speed of twenty miles per hour. As regards hand pumping for air pressure and water to boiler, I do none whatever. I have fitted a combination steam air and feed water pump. Without the above or the air and water pump separate I would not run a car: you can always keep the air pressure up to 60 lbs. without hand power, and of course this makes the generator steam well. When the car stands still any length of time the water in the boiler begins to fall; the usual method is to use the auxiliary hand pump, but when fitted with a steam water pump, all hand power is saved. The above steam combination pump I purchased from Messrs. Morris, of St.roud Green Road, N. The Stanley is, I should say, far in preference to the Locomobile, but no petrol car of same power or more will live with them in a hilly district. I notice the terrible accidents happening daily with petrol cars through failure of brakes; with the Locomobile you can reverse the engine at a moment's notice and pull the car up on any hill.—Yours truly,

Oxon.

## SMELL AND SMOKE FROM MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Replying to "Stupefactus" in the last issue of the *M.C.J.*, doubtless the reason why paraffin is not more used for the lubrication of the cylinders and crank chambers of motors is identical with the reason which prevents so many car owners from inflating their tyres with a shot gun, viz., that it is "somewhat unsuitable." One wonders that some people do not make a few inquiries before flying into print.—Yours truly,

BORED.

## CULPABLE DRIVERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—While I fully realise that there are many good drivers of motor-cars and horses, I am sorry to say that there are some bad ones. In a city crowded with traffic of all sorts a bad driver is a menace, whether he is piloting an automobile or a horse, and brings discredit on all his class. The common rule of the road that in overtaking a vehicle it shall be passed on the right side is frequently deliberately, carelessly and even recklessly disregarded, a driver cutting in between a slow-moving vehicle and the kerb, risking bad accidents and possible death to somebody. Far too many chauffeurs resort to this dangerous practice. If a driver is ignorant of road rules, he is a dangerous person to be permitted on the streets; if he violates these rules deliberately, he has no business on the road. In either case he has no defence. Motor-car agents themselves might do good work by observing the rules of the road and insisting that their employees do likewise; they might also be of benefit to the motoring community by endeavoring to show people what are and what are not correct methods in driving. What the expert does the layman will do, and the public will judge accordingly.—Yours truly,

SALOPIAN.

## REGULATIONS IN THE PARKS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have just noticed that a regulation board put up in Finsbury Park limits the speed of motor-cars travelling through the park to eight miles an hour.

Can you tell me whether the London County Council has power to impose such a restriction on the speed of cars?—Yours truly,

G. S.

## A DANGEROUS PRACTICE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Cannot you do something to call attention to the dangerous way in which some fast motor vehicles overtake and pass cars going slower than themselves? This is, I am sure, a great danger which is increasing every day. Only last Sunday I was myself passed by large cars three times, not one of the drivers of which sounded his horn, nor did I know until they were actually passing that they were behind me. Later, on the same afternoon, the driver of another car evidently intended doing the same thing, but unfortunately ran into the back of my car, causing damage to both vehicles, which will amount probably to hundreds of pounds, as his car, more especially, was practically wrecked. As I have usually found in cases of this sort, the chauffeur was driving.

Personally, although my car is pretty fast, so that I constantly overtake others, I make it a rule never to overtake another vehicle unless I know by some sign from the driver, either by his moving to the left or signing me to pass, that he has heard my horn and knows I want to pass, and I feel sure there will be some terrible accidents this year unless this growing evil is checked; I trust, therefore, you will use your powerful influence to put an end to it.

May I also endorse the good things which have been said of the Automobile Association; it is undoubtedly carrying on a most useful work, and should be supported by all motorists?—Yours truly,

M. A. L.

## AIR-COOLED ENGINES FOR MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—For some time past reports have been coming to hand from the United States anent the successful adoption of air-cooled engines on powerful motor-cars, and I have been anxiously looking forward to the appearance of similar motors in this country. It would appear, however, that British automobile engineers do not look with favour on the idea, as so far nothing seems to have been done in England in the direction named. If the reports be true, there can be no question that during the past year or so the air-cooled motor has gained in popularity in America with great rapidity. Those who are in a position to speak authoritatively consider that the tardy advance of air-cooling, as viewed from an engineering standpoint, is owing to the fact that hitherto efforts have been made to solve the problem with experience gained in producing water-cooled motors. The chief trouble lies in the necessity for proper radiation. All the early experiments were directed toward cooling by air with cylinders designed for water-cooling. Therefore many radiating devices correct in principle and capable of giving excellent results have failed to be satisfactory. In short, air-cooling involves principles entirely separate

and distinct from those applying to water-cooling and must be considered with a clear understanding of that fact. The primitive idea in regard to air-cooling involved the reduction of the temperature of the cylinder walls by means of a blast of cold air blown directly upon them. This principle survived for quite an extended period, all the motors having either a single cylinder of considerable bore, with a fan blowing directly on its head, or multiple cylinders of very small capacity, which did not require other than the natural circulation of air. The change from those types to one employing four vertical cylinders placed longitudinally in the car, as now adopted, presented an entirely new problem in air-cooling, as it is evidently impracticable to blow air directly on the heads of all four cylinders.

It soon became apparent that it was unnecessary to direct currents of air on particular portions of the cylinders, or to make any special disposition of the air currents, other than to insure their free passage around the radiating device used for taking the heat from the cylinder walls. The true principle of air cooling now became clear—that not merely is radiation required but that a proper system be employed to carry away the heat particles from the radiating surfaces. It is important, of course, that the compression chamber be so designed that the surfaces exposed to the hot gases have a uniformly free exit to the exterior radiating device; but the great difficulty is in getting the heat from the radiating device into the surrounding air. Many failures in air-cooling can be traced to the fact that the imperative necessity of conveying the heat from the metallic surfaces has been overlooked, and although the cylinder wall has been surrounded with the most elaborate arrangements for distributing the heat, the matter of conveying it away and providing for a constant supply of air at atmospheric temperature has been entirely neglected. The basis of the remarkable success of certain motors during the past year has been the care with which these details have been worked out.

A common impression prevails that makers of air-cooled cylinders advocate them because they can be cheaply manufactured. However

The 20-25-h.p. Crossley Chainless Car just supplied by Messrs. Jarrott and Letts to Col. J. S. Nicholson, of Basing Park, Alton, Hants. The body, which was built by Messrs. W. and F. Thorn, is arranged to carry seven passengers comfortably. The brougham top is removable, so that the vehicle may be used as an open carriage when desired.

true this might have been at one time, it is not true at the present day. On the other hand, the cost of manufacturing an air-cooled cylinder, employing all the special processes acquired by experience in this branch of the art, is said to be considerably greater than for a jacketed cylinder of corresponding size.

The problem of successful air-cooling multiple-cylinder motors placed lengthwise in the car is considered in America to have been solved, and the public are beginning to look upon cars with air-cooled engines much less sceptically than a few years ago. The simplicity resulting from the elimination of a water radiator, water pump, and cylinder jackets is the object aimed at, and to this can be added the freedom from the trouble in cold weather occasioned by frost.—Yours truly,

ANGLO-AMERICAN.

## MOTOR SPIRIT FROM GAS TAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In the early part of November last there were rumours of the formation of a company the object of which was to introduce a new motor fuel to take the place of petrol. So far as I could ascertain, the new spirit was a product of gas tar, and was stated to contain certain hydrocarbons which had never before been isolated. While being claimed, as the result of experiment, to be equally suitable as petrol as the fuel in internal-combustion engines, its high flash point was stated to enable it to be handled and stored with a greatly reduced danger of accident. Not having so far seen or heard anything more of the new fuel, I write to ask whether you or any reader of the *M.C.J.* are able to give any further information on the subject.—Yours truly,

W. LAWRENCE.

AKONIA.—We have an inquiry for the address of the makers of Akonia.

## CLUBS AND ASSOCIATIONS.

### THE AUTOMOBILE ASSOCIATION.

THE Automobile Association will hold its annual general meeting at the Trocadero Restaurant, London, on Tuesday, June 19th, when Colonel W. J. Bosworth, taking the chair at 4 p.m., will have the pleasure of reporting most gratifying progress made since the inception of the cyclist patrol movement only nine months ago. New members are being elected at the average rate of about one hundred every fortnight, while the patrols are being increased and extended practically every week. Quite a pleasing form of freemasonry exists between all the members, who send reliable information on the subject of police traps from all quarters of the kingdom to the central office at 18, Fleet Street, E.C., where it is tabulated and distributed to subscribers by telegram, telephone, or letter, at any hour in the day.

### LEICESTER.

IN consequence of the difficulty of making the arrangements for the Inter-Club Hill Climb for the Du Pre Challenge Cup, arranged

Fifteen members and friends carried out the fixture, and, despite the inclemency of the weather, thoroughly enjoyed the outing.

The sparking plug competition fixed for this occasion was postponed owing to insufficient entries.

Already the date of the annual dinner has been fixed. It will take place at the Midland Grand Hotel, London, on December 8th next.

### HUDDERSFIELD BRANCH OF Y.A.C.

LAST week we gave the results of the hill climbing-contest of this active club at Meltham. We are now able to give the full record of the contests as follows:—

CLASS A.			
Name.	Car.		Points.
W. B. Lawton	8-9-h.p. Corre	...	124
F. A. Dawson	6-h.p. De Dion	...	122
J. W. Hobson	8-h.p. De Dion	...	96
CLASS B.			
W. Singleton	10-h.p. De Dion	...	136
A. Herman Sykes	10-12-h.p. Argyll	...	133
F. Sutcliffe	10-h.p. De Dion	...	131
Dr. Prior	12-h.p. Corre	...	127
E. G. Learoyd	12-h.p. De Dion	...	125
G. A. B. Lockley	12-h.p. Wolseley	...	108

One of the New Brasier 105-h.p. Racers built for the A.C.F. Grand Prix Race.

to take place on the first Saturday in June, this has been postponed to Saturday, June 23rd. The reliability trials, which were to be held on June 16th, will be run off on August 18th.

A very attractive programme has been issued by this club, much handy information being incorporated in waistcoat-book form.

### NORTH-EAST LANCASHIRE.

AIN the 400 miles reliability run from Whalley to Edinburgh organised by this club the following ten cars completed the run without a stop, and will each receive a gold medal:—

Burton Hacking (18-24-h.p. Bel-size).	W. D. Coddington (30-40-h.p. Daimler).
J. Bibby (28-36-h.p. Daimler).	Havelock Lonsdale (30-40-h.p. Daimler).
C. F. Bury (28-36-h.p. Daimler).	Robert Mangnall (40-h.p. Napier).
G. Burton (28-36-h.p. Daimler).	Arthur Birtwistle (35-h.p. Daimler).
J. Briggs-Bury (30-40-h.p. Daimler).	F. Birtwistle (60-h.p. Mercedes).

### NORTH LONDON.

THE fifth outing of the season took place to Buntingford. The weather was bad, the roads were bad, and the attendance was poor.

### CLASS C.

D. Stoner Crowther	40-h.p. Napier	...	124
A. Farnell	30-h.p. Daimler	...	117
H. Walker	30-h.p. Daimler	...	114
Eli Sutcliffe	14-h.p. Clement-Talbot	...	98
Dr. Rogerson	8-10-h.p. Coventry Humber	...	93
H. Dickinson	30-h.p. Ariel	...	83
E. Hoyle	14-h.p. Gladiator	...	82
C. F. Crowther	18-h.p. Clement	...	81
W. Moorhouse	15-h.p. Darracq	...	79
H. Broadbent	15-h.p. Darracq	...	77
R. V. Middlemost	24-h.p. Dennis	...	75

The officials who ably carried out the event were as follows:—President and referee, Alderman W. H. Jessop; clerks of the course, Messrs. W. Blamires, J. D. Crowther, A. Dawson, H. Dickinson, E. Lawton, E. G. Learoyd, R. V. Middlemost, W. Priest, F. Sutcliffe, and F. H. Wilson; starter, Mr. F. A. Reed; timekeepers, Messrs. A. Fattorini, Bradford, and J. A. Walker, Leeds; handicappers, Messrs. W. Blamires and H. Broadbent; clerk of the scales, Mr. J. D. Simpson; hon. secretary, Mr. E. Gordon Learoyd.

### MOTOR YACHT CLUB.

FIVE boats were entered for the first of the fortnightly handicaps of the Motor Yacht Club, Southampton, on Saturday last, but only three appeared at the start—Captain Dixon's Hebe, Mr. J. D. Siddeley's

Kathleen, and the rear-commodore's Commander. The course was from inside the Enchantress, round Calshot Lightship, back to the buoy at the entrance to the Itchen River, and finishing at the Enchantress, a distance of twelve nautical miles. Hebe had to allow Kathleen 10 min., and Commander 20 min. 48 sec., while Kathleen allowed Commander 10 min. 48 sec. Hebe retired when off Hythe pier, leaving Kathleen to finish first. Commander lost by only 80 sec.

### SOUTHERN.

THE successful team representing this club in the Gamage inter-club competition consisted of Messrs. H. Gutteridge (5-h.p. Peugeot), R. Jackson (4½-h.p. De Dion), M. Brooke (24-h.p. Malcolm), W. H. Nixon (6-h.p. Regal), C. Brodie (24-32-h.p. Darracq), and H. Jones (6-h.p. Wolseley).

THE Derby Club will hold a gymkhana at Burton-on-Trent on the 14th prox.

THE Reading A.C. is being dissolved on the 24th inst.

### ROAD REPORTS.

**NORTHAMPTONSHIRE.**—With regard to main roads under the direct maintenance of the Northamptonshire County Council, it is the practice when repairing them to disturb, as far as considerations of width allow, only one side of the road at a time; with regard to main roads not under direct maintenance, the County Surveyor has recently been directed to draw the attention of District Surveyors to the matter. Instructions have also been given that before leaving off work at the end of a day loose stones are to be dry-rolled and tapered with chippings at each end.

**ESSEX.**—The tarring experiments on the main road from Chelmsford to Colchester, in the parish of Springfield, have served as a useful object lesson. The Grays Urban Council have tried tar with such success that they have decided to spend a further sum of £300 on similar work. The financial result is excellent, the saving in watering, scavenging, and repairing being considerable. But of course the great advantage is the minimising of the dust nuisance. The tarring of the streets is much appreciated by householders.

**FARNBOROUGH.**—The road from Green Street Green to Farnborough has been newly tarred and is proving a satisfactory solution of the dust problem.

**ROADS IMPROVEMENT.**—In continuance of its campaign for securing wider and better roads, the Roads Improvement Association have during the past month distributed over five thousand pamphlets. These pamphlets examine the existing system of highway administration and show the legislative and administrative changes which are necessary if the roads of this country are to be made safe and dustless and generally adapted to modern conditions of traffic without any large additional expense to the ratepayer or the taxpayer. As a result of the many complaints received as to the condition of the roads in some of the Welsh counties, over one thousand copies of the Association's "Hints to Country Roadmen," printed in the Welsh language, have been distributed.

### MOTOR-CAR ACCIDENTS.

AN inquest was held at East Dean, near Eastbourne, on the body of Miss Mary Elizabeth May Metters, age 21, daughter of Mr. and Mrs. John Metters, of Cross of the Hill, near Stratford-on-Avon, who was fatally injured in the motor-car accident reported in last week's *M.C.J.*, on the previous Tuesday, when her parents, who were also in the car, were injured. John Reed, the driver, stated that when he saw the "danger" notice at the top of the hill near East Dean he shut off the engine and did not put it on again. As he went down the hill he had his foot on the right-hand brake. He noticed a horse apparently in the middle of the road, and as it did not move he went to the right and tried to avoid it. The car skidded, and he tried to right it by turning sharp to the left. The car seemed to have got fixed, and the back part of it struck a low flint wall. The witness was thrown on to the wall, and the other three persons in the car were thrown into the road. He attributed the accident to the skidding, and denied that his brakes failed to act. The jury returned a verdict of "Accidental death," and exonerated the driver from blame.

EARLY on Tuesday morning an attempt was made to wreck the motor mail van which runs between Sunderland and Newcastle. A quantity of stones had been placed in the middle of the roadway, and the driver had a narrow escape.

ON Saturday a serious motor-car accident occurred at Wellington, Salop, by which several people were injured. Mr. J. K. Starley, of Coventry, Mrs. Starley, and Mr. Starley's two sisters left Coventry in a car, intending to proceed to Llangollen for the Whitsuntide holidays, and when near Wellington the car came into collision with the foremost of two horses attached to a furniture van belonging to Shrewsbury. The motor car ran into a hedge, with the horse on top, and the occupants had narrow escapes, one of the ladies jumping out. The car was almost a wreck, the front being smashed in and the sides broken. After their injuries had been attended to the party returned by train to Coventry.

### THE MOTOR CYCLING CLUB'S RUN TO EDINBURGH.

FROM the top of Highgate Hill eighty-two entrants in the annual run of the Motor Cycling Club started on Friday of last week. Forty-eight of them survived the journey, reaching Edinburgh on Saturday evening. The start of the motor-bicycles began at 10 p.m., and forty-nine machines were despatched at half-minute intervals. Sixteen tri-cars followed, and at 10.40 p.m. the seventeen cars were sent on their way.

For a good many miles strong winds and muddy roads made the journey anything but enjoyable, but things improved as the north was invaded. The Scottish borders were reached by the foremost riders shortly after 4 p.m., and Levenhall (the last control) about 7 p.m. There the competitors were "controlled" until eight, when the first of the arrivals, who were three motor-cyclists, set out again, reaching the North British Hotel at Edinburgh at 8.30. At 8.37 twenty-one others arrived in a cluster, and twenty-four more had reported themselves before 10.40, when time was up.

Thus there were forty-eight out of the starters who covered the distance within schedule time, and these were made up of ten cars, four tri-cars, and thirty-four cycles. Mr. F. T. Bidlake, who checked the times as the competitors arrived, had early on Sunday morning the duty of restarting fifteen of the successful forty-eight on their return journey in competition for the Schulte Cup. About 12.15 the competitors were in readiness outside the N.B. Hotel, and a quarter of an hour later they were dispatched.

During the run special interest attached to the 12-15-h.p. Talbot car driven by Miss Agnes Wood, who rode in her first trial without any difficulties of any kind.

The First Three Arrivals at the Levenhall Control.

The riders who accomplished the journey within the twenty-four hours were:

**Motor-bicycles.**—Messrs. E. W. Ashworth, D. S. Baddeley, L. A. Baddeley, G. A. Baddenoch, J. A. Bailey, L. W. Bellenger, H. E. Blackney, F. M. Bond, H. M. Bond, R. G. Booth, R. M. Brice, M. Campbell, A. B. Drummond, D. K. Edwards, H. S. Freeman, S. E. Frost, O. C. Godfrey, E. W. Goslett, C. J. Hart, F. Hulbert, H. F. Hild, W. Jacobs, G. G. Koop, F. Mussell, A. G. Reynolds, W. A. Sale, H. B. S. Shutes, A. J. Sproston, N. J. Tuchmann, S. Webb, W. H. Wells, A. Williams, T. Woodman, and A. Wright.

**Tri-cars.**—A. C. Earp, W. Gunn, Miss Muriel Hind, J. Van Hooydonk.

**Cars.**—J. Platt Betts, A. J. Brown, C. W. Brown, F. J. Jenkins, F. W. Peckham, W. E. Price, S. J. Sewell, J. W. Stocks, H. Taylor, Miss Agnes Wood.

### POLICE TRAPS.

CONFETTI as a note of warning of the presence of police-traps is calculated to help motorists considerably. Messrs. Gamage are supplying a specially-coloured confetti, which motorists sprinkle when running through such a device. Drivers who follow at once read the sign and act accordingly. There should be fewer fines after this.

MOTORISTS should drive with caution between Kensington Church and Addison Road Railway Bridge, W.

### PUBLIC MOTOR SERVICES.

A PROPOSAL is being made for a motor vehicle service between Malvern and Gloucester.

THE Tadmorden Town Council has decided to purchase four double-deck omnibuses.

THE motor-car service between Bettws-y-coed and Corwen has been re-commenced for the season.

## NEW COMPANIES REGISTERED.

RAGLAN MOTOR COMPANY, LTD.—Capital £2,000. Objects and all other particulars as in Anti-Friction Motor and Engineering Company, Ltd. (q.v.).

ITALA AUTOMOBILES, LTD.—Capital £20,000. To carry on the business of dealers in motor-cars and carriages, garage keepers, etc. Registered Office, 89, Wigmore Street, W.

EUSTON MOTOR COMPANY, LTD.—Capital £10,000. To adopt an agreement with Messrs. A. C. Gibbons and B. S. Rice, and to carry on the business of vendors of, agents for, and dealers in motor-cars.

ANTI-FRICTION MOTOR AND ENGINEERING COMPANY, LTD.—Capital £2,000. To carry on the business of manufacturers, importers and exporters of, and dealers in motors, motor-cars, cabs, broughams, omnibuses, wagons, and other light or heavy vehicles, etc.

EARL'S COURT MOTOR GARAGE COMPANY, LTD.—Capital £2,000. To carry on the business of motor-car and garage proprietors, &c.

CARLTON GARAGE, LTD.—Capital £2,000. To take over the business carried on by Mr. E. D. Billing at 5, New Burlington Place, W., as the Carlton Garage. Registered office, 5, New Burlington Place, Regent Street, W.

MACINTOSH TYRE COMPANY, LTD.—Registered 18th May. Capital £7,500, in £1 shares (2,500 "A" and 5,000 "B"). Objects: to adopt an agreement with Charles Macintosh and Company, Ltd., and M. Adler, and to carry on the business of factors and repairers of and dealers in tyres for cycles, motors and other vehicles, &c. No initial public issue. Registered office, Lower Cambridge Street, Manchester.

## CASES AGAINST MOTORISTS.

A LADY motorist, Miss Eleanor Morgan, of Willesden Green, has been fined £10 and costs at St. Albans, for negligent driving of a motor-car. The charge was the result of an accident, the car being driven on to the pavement and knocking down a girl, whose leg was broken.

AT Chertsey, Mr. B. T. Frost, a London gentleman, was fined for having no legal number on his motor-car at Weybridge. The police alleged that the defendant drove his car through the village with the number chalked on in large letters. A constable who stopped the car put his fingers across the figures and rubbed them out.

A LARGE batch of motorists have just been fined by the Ryde Bench for exceeding the legal limit in the Isle of Wight.

FOR failing to produce his licence when desired by the police an Abergavenny doctor has been fined 1s. by the magistrates at Ross. The costs will be 10s.

THE driver of an "Arrow" motor-omnibus has been fined 20s. at the West London Police Court for careless and negligent driving.

A MOTORIST has been summoned at Belfast for not keeping on his right side of the road. A fine of 5s. and costs was imposed.

VICTOR SPECK was charged at Lambeth Police Court with the manslaughter of Amelia Biggs by driving a motor-car over her at Peckham Road on Sunday afternoon. When charged, prisoner replied, "I thought they would cross right over the road." Mr. Hopkins remanded the accused for a week, but accepted bail in £20 for his appearance.

## TUITION IN AUTOMOBILISM.

IN our Comments we draw attention to the new departure of Argylls London, Ltd. In these classes the theory and principles of the petrol engine and other parts of a motor-car will be explained by means of diagrams or lantern slides, and also by an examination of the actual parts under discussion. A portion of the Argyll depot at 17, Newman Street, will be set apart for the purpose, and among the features of advantage to those attending these classes will be the opportunities afforded them of examining different types of cars actually undergoing repairs on the premises.

Two courses of lectures will be given, one for owners and the other for drivers, and each month a syllabus of lectures and demonstrations will be drawn up for each. A complete chassis will be placed in the lecture room for the benefit of students, to enable them more fully to grasp the function and operation of the various component parts of the car. Instruction combined with practical demonstration will be given in the starting or stopping of the engine, and the controlling of engine speed by either throttle or ignition, also in gear changing, operation of brakes, removal and repair of tyres, and all necessary adjustments to any part of the mechanism, as well as hints given as to various temporary repairs which may be effected in case of an emergency. Actual lessons will be given in motor-car driving, the student passing through the various stages until he is finally entrusted with the care of the car in the densest traffic.

## SPEED TRIALS ON THE SANDS.

THE Yorkshire A.C. is organising a series of speed trials on the sands between Saltburn and Redcar, to take place on Saturday, the 14th prox., the exact hour of starting being dependent on the tides. Mr. G. H. Hepper will be the marshal in chief, Mr. J. H. Teague will act as starter, and Mr. C. P. Wilson will act as secretary of the meeting. Prizes are being presented by Sir Hugh Bell, Bart., Messrs. H. R. Kirk, F. W. Wood and Rowland Winn, and by the directors of the "Sheffield Telegraph," and the contests will include an attempt to establish a new Yorkshire record.

## THE FROME'S HILL CLIMB.

WITH reference to the Frome's Hill climb reported last week the following record of the cars which were placed in the first twelve positions on the handicap formula is of general interest. In addition to the four fastest cars already chronicled, congratulations may be extended to Mr. O. Cupper, whose 30-35-h.p. Metallurgique car was fifth and actually was placed ahead of the others on the handicap formula, as is shown in the following table:—

1st.—10-h.p. Alldays.	6th.—30-35-h.p. Metallurgique.
12-16-h.p. Clement Talbot.	7th.—30-40-h.p. Daimler.
2nd.—10-h.p. Alldays.	8th.—8-h.p. Darracq.
3rd.—12-16-h.p. Clement-Talbot.	9th.—12-h.p. De Dion.
4th.—10-12-h.p. Clement-Talbot.	10th.—16-20-h.p. Humber.
5th.—8-h.p. Rover.	11th.—6½-h.p. Wolseley.

## THE MOTOR CYCLE RECORD.

ON the Canning Town track, on Monday, some interesting motor-cycling contests between G. A. Barnes and C. R. Collier resulted in some new records. In the three mile race Collier rode the second mile in 58 sec., the time for the two miles being 2 min. 5 4-5 sec., the first being a record for the flying mile, and the second beating previous best efforts for the two miles. His time for the three miles was 2 4-5 sec. in front of the record, being 3 min. 5 sec.

## THE AUTO CYCLE CLUB.

THE club intend promoting an Open Hill-climb up the famous Birdlip Hill. Full particulars will appear in the *M.C.J.* in due course, but the date of the event will probably be the end of August or early in September.

The entries for the Land's End to John o' Groat's Trial for motor-cycles total sixty-nine in the bicycle class, of which fifty are those of private owners. There are twenty-three in the passenger class, twelve of which are private and the others are trade entrants. The horse-power of the bicycles ranges from two to six, while the tri-cars are from four to ten h.p.

## OBSTRUCTING MOTOR CARS.

BEFORE the Reading Borough Bench, Ernest Adams and George Eggleton have been summoned by Major Portal for obstructing a motor-car with a truck in the Bath road. Adams was fined 10s. including costs and Eggleton 5s. including costs.

AT Uttoxeter, Herbert Smith has been fined £1 for obstructing a motor-car and ordered to pay £5 for causing an accident. It was given in evidence that he deliberately turned his horse and cart across the road as the car approached. The driver, to avoid a collision, ran into the hedge.

## THE SOUTH HARTING HILL CLIMB.

THIS event—a closed competition for members of the A.C.G.B.I. and the Sussex County Automobile Club—will take place on the 23rd inst., over a course of a mile in length. Vehicles will be timed from a standing start with a flying finish; the classes being (A) for cars listed between £150 and £300, (B) for those the chassis price of which is between £300 and £500; (C) for those ranging from £500 to £850, and D for cars the chassis price of which is over £850.

Entries will be received up to the 16th inst., at 119, Piccadilly, W.

## MOTORIST v. MOTORIST.

AT the Brompton County Court, last week, Mrs. Mary Illingworth, of Lady Royde Hall, Bradford, Yorkshire, sought to recover from Mr. A. J. Buck, of Addison Gardens, S.W., damages for injury to her motor-car, caused by the defendant's car running into it as it was being taken through London to Nice. For the defence, it was suggested that the plaintiff's "huge vehicle" shot from behind an omnibus into the defendant's car. Judgment for £29 odd was given for the plaintiff.

## TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

## COMMENTS.

A PARTY of aeronauts made a novel moon-light trip from London one night last week. The balloon "Dolce far Niente," of 45,000 ft. capacity, belonged to Mr. F. H. Butler, who was accompanied by Professor Huntingdon, Mr. Charles Maude, and Mr. C. F. Pollock. The party ascended from Wandsworth Gas Works at nine p.m., and had a splendid view of London and its millions of lights. The river was first crossed at Richmond, and at a quarter to ten, when passing over Eton, the balloonists had a splendid view of the "Fourth of June" firework display. The river was recrossed at Shiplake Lock, and again at Goring and Streatley. Thence the aeronauts went over Churn Camp, on the Berkshire Downs. A magnificent sunrise soon afterwards made the shadow of the balloon, thrown by the moon, disappear. At five a.m. Cheltenham was reached, and as the balloon was travelling at a height of only 500 ft. a fine view of the town was obtained. The descent was made at six o'clock on the estate of Mr. J. W. Dowson at Pershore, on the River Avon. Mr. Dowson entertained the aeronauts most hospitably, and the party subsequently returned to town.

### Automobile Gymkhanas.

A NEW item, "the Horsey Motorists," appeared on the programme of the gymkhana at the Suffolk Agricultural Show last week. The motorist was required to drive a horse and trap round the ring, unharness the horse, and finish up by circling the course with his motor-car. From the viewpoint of an audience mostly composed of agriculturists, this was certainly the best event on the programme. The ludicrous efforts of one or two competitors to master the unharnessing operation evoked roars of laughter, besides such humorous injunctions as "Take the shoes off" and "Put it on the tail." The difficulties of arranging programmes sufficiently varied to attract the public at motor-car and agricultural meets have been sufficiently great to tax the ingenuity of the organisers of such events. Anything novel, therefore, becomes a matter of general interest.

### Motor-Car Imports and Exports.

THE returns relating to the imports of foreign motor-cars and automobile parts into this country during May last are of more than usual interest, as, in place of the continuous expansion hitherto recorded, they show for the first time a decrease. The imports last month comprised 508 complete vehicles valued at £217,050, and parts to the total of £176,753, the combined sum being only £393,803, as contrasted with £403,229 in April last, and £404,809 in May, 1905. The reason for the shrinkage is not far to seek, it being due to the recent labour troubles in France and Italy, which brought about a suspension of deliveries from those countries. So far this year, that is to the end of last month, the aggregate imports have amounted to £1,921,094, as against only £1,452,203 in the same period a year ago. Although small in proportion to the imports, the exports of British motor-cars continue

to steadily advance. Last month 71 cars valued at £29,356 were shipped, to which have to be added parts to the extent of £26,630, giving a combined total of £55,986, which compares with £40,392 in the preceding month, and only £25,684 in May last year.

### A Motor Union Prosecution.

THE Motor Union were the prosecutors in the case reported elsewhere in the present issue and heard at Bromley on Monday, when Mr. R. L. Powell appeared to answer a charge of assault upon Viscount Royston while the latter was seated in his motor-car. After hearing witnesses the Bench unanimously decided to convict the defendant and fined him £2 and the court fees. On the application of counsel defendant was also ordered to pay two guineas towards the costs of the prosecution. It is highly satisfactory to note that a signal victory has thus been gained by the Motor Union in defence of the rights of motorists. We may add that the Union are always prepared to undertake a prosecution when any of its members are the victims of unprovoked assault. Particulars should be forwarded to the secretary, Albemarle Street, London, W., the day the offence is committed.

### 'Bus Steps.

AGILITY in dismounting from the steps of the ordinary 'bus is one of the attributes of the modern man of business, whose insistence on the vehicle being stopped while he retires is met with scowls from his whilom fellow passengers anxious to hasten the journey. Now that the motor-'bus has come so strongly to the fore his difficulties have increased, and only the very venturesome persons are now willing to risk their necks by dismounting while the motor-'bus is in motion. Possibly some day we shall jump from the motor-'bus as naturally as we alight from the lift; but that time is not yet. Meanwhile it may reasonably be urged that those responsible for the safety and control of public service vehicles should make a determined effort to secure that the steps should be at a uniform height from the ground, and so help to avoid the miscalculations which may become a serious source of danger to the public.

### Route Maps.

THE enormous amount of ground which a motor-car can cover in a day enables the motorist to run over the edge of most large-scale maps in a very short time; therefore the only chance a map-maker now has is to make a map long enough to outdo the day's work of a car. In the "Strip" maps something of this kind is attempted, and a route of some 200 miles in length—a strip of map eight feet long—is folded up into pocket size. No doubt if the "strip" gets loose there will be a long streamer of map trailing out of the car, but when we can get almost any main route of the country on a large scale, with a "contour" plan thrown in, it is worth while taking a little care not to try the experiment. Messrs. Gall and Inglis' maps are designed to connect up with each other, so that motorists can have maps of, say, from London to Edinburgh, either by York or by Preston. The "Highland Road" map, which is now issued in lengthened form, is part of the route

from London or Land's End to John o' Groat's, the length of map in this latter being 32 ft., in five sections. The "Oxford Road" goes much further than its designation implies, the route given being the road through Oxford to Gloucester and Cheltenham, and the branch from Oxford to Worcester. By this means the map actually shows two routes from London to Malvern, and by the use of this one strip a motorist can go there by Worcester and return by the easier road by Cheltenham. These "Strip" maps are certainly a great convenience, as their clearness and distinctness enables motorists to do without stopping by the way to make inquiries.

#### The British Motor Cycle Team.

THANKS to the kindly interest of the Earl of Derby, the selection contest to determine the team to represent this country in the International Motor-cycle Race was held on Thursday of last week in Knowsley Park, near Liverpool. On another page we give a report of the trials, from which Messrs. C. R. Collier, H. A. Collier, and C. B. Franklin emerged with distinction as the selected trio. We trust they will do as well in Austria.

Miss Agnes Wood at the wheel of the 12-16-h.p. Clement Talbot which she successfully piloted in the London to Edinburgh run of the Motor Cycling Club on the 1st and 2nd inst. Miss Wood arrived at the General Post Office, Edinburgh, exactly on schedule time, having made an absolutely non-stop run in 22 hours 40 minutes, including 1½ hours stoppages in the various controls on the road. The car made the trip without a single adjustment being necessary. We believe Miss Wood is the first lady to successfully drive a car in an officially recognised run from London to Edinburgh.

#### Lady Drivers.

MISS MURIEL HIND has come rapidly to the fore as a motorist. She obtained a special certificate for her performance in the Albert Brown trophy contest last year, and was one of two lady drivers in the London to Edinburgh run of the Motor Cycling Club, handling a 9-h.p. Singer tri-car, the behaviour of which was admirable in every way. On Monday she started in the Auto Cycle Club's end to end trip, being the only lady driver, and taking with her a lady passenger. Miss Hind pins her faith to the Singer productions, and believes that her sex will become an important factor in motor competitions in the future. In the ordinary way they can learn to do most of the repairs that may be necessary, and, adds Miss Hind, "there are always passing motorists ready to help if required." Another lady who has won renown this year is Miss Agnes Wood, whose performance on the 12-16-h.p. Clement-Talbot in the London to Edinburgh run has given her distinction. In Scotland, Mrs.

Loder has been repeating her exploits of last year, and, although she has changed her "mount," her enthusiasm for motoring is, if anything, keener than ever.

#### Ambulance Work.

DR. HENRI NACHTEL is again in London endeavouring to persuade the authorities to hasten the extension of the ambulance system on lines similar to those he has been able to recommend for Paris as well as for the important cities of Italy, Austria, Germany, and other European countries. He is somewhat disappointed at the intention of the London County Council to ask for Parliamentary powers to establish a motor ambulance system, because, he says, this will delay the adoption of the idea, and also add to the expense of its initiation. The London County Council propose to have two stations of ten motor ambulances each, and the cost of each motor ambulance is reckoned at £560; this makes £5,600 as the cost of one station, exclusive of medical and working expenses. We do not agree with Dr. Nachtel's view that no gain would be possible in regard to time, for it is wrong to suggest that the horse traffic will be a permanent deterrent to rapid transit, when this is decreasing, so far as the metropolis is concerned, every week.

#### A Good Haul in Surrey.

SIR A. CONAN DOYLE, speaking at a banquet given by the High Sheriff of Surrey to the county magistrates, has been giving some very homely and useful advice. He made the suggestion that constables released from watching motorists, who did little harm except to themselves, might shadow some of those men who were terrors to the countryside by causing fires on Surrey commons. This is so extremely simple and so desirable that it can hardly be expected to appeal very strongly to benches of magistrates who find police traps a most profitable form of investment for the county—an instance of which was afforded in the Reigate Court on Saturday, when the police proceeded against eighteen motorists, securing over £60 for the county exchequer.

#### Motorists and the Law.

At the monthly meeting of the General Committee of the Motor Union the Legal Cases Committee reported that they had dealt with thirty-six applications. Advice and information had been given in all cases, and financial assistance in several. Two of the grants were towards the cost of appeals to Quarter Sessions against convictions for reckless driving, as these convictions appeared to the Union to be against the weight of evidence. In one of these cases the appeal was upheld by the Quarter Sessions and the conviction quashed. Another case in which financial assistance was also given was to the owner of a heavy motor vehicle for being wrongly summoned by the police under the Locomotives Act, although it was pointed out to the police before the summons was issued that the Locomotives Act did not apply to a motor-wagon. The magistrates marked their disapproval of this police blundering by awarding costs to the defendant.

#### A Trio of Dismissals.

THAT one motorist should escape conviction in an English court of justice is remarkable; that three cases against those who drive automobiles should be dismissed is almost marvellous. Yet such an incident has actually happened—not, of course, in Surrey, Sussex, or the regions about, but at St. Austell, in Cornwall. One of the alarming pieces of evidence vouchsafed by the policeman who saw the speedy car from his garden was that there were about twenty children at the side of the road when it passed; if they had been in the centre of the highway they would not have had time to get out of the way. Two of the cases were dismissed without comment;

in the third the magistrates gave the defendant the benefit of the doubt, and "the decision of the Bench was received with applause, which was instantly suppressed."

#### Dealing with the Dust Nuisance.

◆ QUITE a reasonable attitude is being adopted by some of the local authorities with regard to the dust nuisance, and we notice that the City Council of Worcester has declined to sanction a suggestion made by its Streets Committee that the attention of the Local Government Board should be drawn to the dust nuisance as a result of the motor-car traffic. In place of that the Council has resolved to ask the authorities in Whitehall what steps they are taking to discover the most effective and the most economical method of rendering the roads dustless, when used either by motor-cars or horse-drawn vehicles. This reference of the matter to the central authorities is a wise course to pursue, and is being adopted by the Cuckfield

#### In South Wales.

MR. C. H. PALETHORPE has just enjoyed an 800 miles tour. The roads, on the whole, he describes as fair, but south of Aberystwyth fearful hills were encountered and, at times narrow, winding roads. In one South Wales county, from some motive antagonistic to motoring, the County Council had left the metal on the roads to be rolled in by the traffic and had kept the steam rollers in the yard. He came on one of these roads south of Cardigan, and passed over some hundreds of loose metal patches. Some of the hills were terrific in gradient, such as Kittle Hill in the Gower. The finest road, which might be termed absolutely perfect, was from Swansea to Cardiff—that is, after leaving Neath (eight miles from Cardiff), a 38 miles stretch, absolutely free of stones, and perfectly even surface. The road continued good through Newport, Chepstow, and up the Wye Valley to Tenby and Monmouth—in fact, the remainder of the journey. He found the horses between Aberystwyth and

The Herkomer Trophy Touring Competition. The cars arriving at the Austro-German Frontier. (See page 339.)

District Council under somewhat unusual circumstances. Some time ago the Cuckfield Council resolved to make some experiments, and then altered their minds and the whole thing fell through. With the advent of the dust season the Surveyor wondered how a simple dressing of tar would result. A member of the Council thought it a pity not to experiment for want of tar, and offered to supply a barrel. Four other members were similarly disposed, and offered other barrels. The Surveyor used some of the tar and found it answer well, but another member suggested that the tarring of the roads was illegal, not having been sanctioned by the Council. The outcome of the whole business was curious, but interesting. The action of the Surveyor was not approved, but he was authorised to go on tarring until the barrels were empty. The experiment is said to answer well, it mitigates the dust trouble, saves much watering, and preserves the surface of the road. On these grounds it has been decided to ask the County Council to contribute an extra percentage to the maintenance of roads treated with tar.

Cardigan fearfully frightened, just as they were in the early days of the movement. Evidently there is very little motor traffic in that district. All hotels (and many of them very old-fashioned) gave the motorists a hearty welcome and every attention, and always found good room for the car, a marked improvement on the early days of motoring.

#### The Value of Exhibitions.

◆ Few industries have derived so much benefit from exhibitions as that associated with the motor-car. The displays at the Agricultural Hall many years ago prepared the way for the coming of the car, and familiarised the public with the mechanically-propelled vehicle. It would be difficult to adequately estimate the importance of such object lessons in the development of the industry. The influence is by no means limited to any insular area—proof of which has just come in a batch of reports of the March exhibition at the Agricultural Hall appearing in the newspapers of Singapore and Ceylon.

evidence of the wide sphere of publicity claimed by this show, thus extending its value far beyond these islands.

#### The Location of Police Traps.

ACTION is being taken by the Highways Protection Committee of the Motor Union to secure a return of the measured stretches of road over which the speed of automobiles is taken by the police authorities, with a view to prosecution when such trapping devices are on wide thoroughfares or on straight and open country roads where there is no suggestion of danger. Particulars are not required when the speed is taken through narrow villages or round dangerous corners or across the openings of converging roads when these characteristics have been properly indicated—as all such places should be—by the red triangle.

#### In the Thames Valley.

FAMOUS among the well-known hostleries which give comfort to those who revel in the beauties of the Thames Valley, Skindle's Hotel at Maidenhead now has added interest in the provision of a garage which has recently been made. The scene on any of the fine Sundays that we have lately enjoyed has been unique, the number of cars calling there representing a value of many thousands of pounds, and testifying to the way motorists will support those who endeavour to cater for them on reasonable and proper lines. The garage is not merely a house of storage; it is under the control of Mr. A. E. Major, of Reading, whose experience has enabled him to undertake everything, from the supply of lubricants to the repair of important pieces of mechanism. The fact that Mr. Major is now in charge of affairs should attract many more motorists that way and should prove a factor in the prosperity of Maidenhead.

#### Courtesy.

THE REV. A. J. C. CURWEN, of Appleby, is in favour of further taxing motors, which, he says, have a demoralising tendency in causing their owners to disregard the comfort and convenience of others. When he sees ladies clad in delicate blouses smothered in dust, he wishes he had the pen of a Ruskin. He discovered one gentleman in North Westmorland who had the courtesy to slow down when meeting anyone, but Mr. Curwen subsequently found out that he was a candidate for Parliamentary honours. Such are the views which this gentleman recently expressed at a public gathering, and, while we do not wholly endorse his opinion as to the general discourtesy of motorists, we would emphasise the need for drivers to show courtesy to all.

#### Crawley.

CRAWLEY is one of the most familiar little towns to the southern motorists, for it is on the main London road to Brighton. Rather more than a mile to the north of the busy little place there stands by the roadside a post with "County of Surrey" on one sign and "County of Sussex" on the other. Old people who dwell near talk of the times before the railway was made, when forty four-horsed coaches ran either way in the twenty-four hours, besides carriers' wagons, post-chaises, and private vehicles. In passing through the county all traffic was stopped on six occasions by toll gates, at Crawley, Warninglid, Hickstead, Muddleswood, Dale Hill, and Patcham, although at some of them a ticket was given which carried travellers through the next on the list without another payment. Most of the old toll houses are still standing, although a quarter of a century has passed since the last gate was removed. After the railway was opened the traffic on the road became scanty. The great coaching inns had little custom, and the stables, formerly needed for so many teams of good horses, were utilised as farm buildings. In the sixties a pleasure coach

from London to Brighton was started. Then came the day of the bicycle—first the "bone-shaker," then the high front wheel, and lastly the safety, this being succeeded by the motor-car. Cycles and automobiles have changed the character of the town of Crawley completely. Its main street is still disfigured by that relic of barbarism—a level railway crossing, and, as the "Sussex Daily News" remarks, it is no uncommon sight to see the gates shut and a group of vehicles, from the high-grade motor-car to the donkey cart, waiting on either side.

#### Who Reads the Journal.

NOT often do we refer to the advertising columns of the *M.C.J.*, but the way in which drivers and others have lately been reaching owners of cars through our pages is sufficiently notable to call forth comment. Every week hundreds of men interested in various capacities in the automobile industry make known their requirements by means of the small advertisements; these, they know, are read by motorists looking for their services, and the replies they obtain are a tribute to the attention which owners of cars and those on the look-out for men devote to the *M.C.J.* The same tendency may be noted with regard to cars, the number of which advertised for sale and exchange every week testify to the influence exerted by the *M.C.J.* among owners of vehicles in all ranks of society.

#### A Hint to Drivers.

CASUAL perusal of the advertisements which are inserted from time to time by drivers has led us to suggest that much time might be saved and convenience afforded if those seeking situations would give a few definite particulars when stating their qualifications. To say that a man has had ten years of experience does not convey much really helpful information to the likely employer. Better is it to give information as to the makes of car with which the applicant is familiar, thus affording some clue as to likely ability in the particular situation that is offered. Nor need drivers be too captious in detailing their requirements. To qualify the desire for a situation by objections to cleaning cars reminds us of a servant who wanted a place where the work was put out.

CONSIDERABLE damage was caused on Wednesday morning by a fire at the motor body building works of Messrs. W. and F. Thorn, Little Portland Street, London, W. A number of valuable cars and chassis were destroyed.

MR. W. M. McTAGGART, of Dublin, has completed the Irish "end-to-end" course in 20 h. 55 min., beating the previous record by 7 h. 28 min. Driving a two-cylinder 10-12-h.p. Argyll car, his average speed during the day worked out at over twenty miles per hour, and during the night at nineteen miles per hour. The distance is 395 miles.

As mentioned in a recent issue, Messrs. Hall, Capris and Co., Ltd., the sole concessionaires for the Isotta-Fraschini cars for Great Britain and Ireland, have taken Messrs. Reading's premises at 14 and 15, Riding House Street, Langham Place, London, W., opposite Queen's Hall, where they have four large floors on which they intend catering for all branches of the automobile business, including repairs, which will be carried out by Mr. A. Capris, who was for six years foreman to Messrs. Panhard and Levassor. Mr. H. C. Hall, who is a partner of the well-known firm of H. E. Hall and Co., of Tonbridge, is the managing director, and will superintend the orders for Isotta-Fraschini chassis, while the late staff of Messrs. Reading, an old-established high-class firm of carriage builders, will take charge of the body-building department. A special feature is to be made of this branch, with the view of turning out high-class bodies in reasonable time. The Isotta-Fraschini is a high-class car in Italy, and came through the late trials with great success. Although the vehicle only made its first appearance at the recent show at the Agricultural Hall, quite a number of them have already been sold, among the purchasers being Lord Carnarvon, Mr. Charles Temperley, Mr. Montague Jones, Mr. A. C. Cooke, Mr. P. Fawcett, and Mr. H. Reynolds.

# The Herkomer Trophy Touring Contest.

FRANKFORT-AM-MAIN, Tuesday, June 5th.

ON the eve of commencing the second annual international motor-car competition for the Herkomer Trophy, it is plain that we are going to have very different weather from the bright sunshine and awful dust experienced last year. We have seen nothing but bulky rain clouds overhead ever since leaving England, and the air is chilly and damp. Despite this, however, our spirits are excellent, for the members of the committee appointed by the German, Austrian, and Bavarian Automobile Clubs deem themselves so highly complimented by the large number of British competitors who have come over to represent the Automobile Club of Great Britain and Ireland in a try for the trophy that we have experienced nothing but courtesy from the moment of our arrival. Moreover, of the 156 cars which put in an appearance to-day, we are told that the fight will be between a third of that number only, and will resolve itself (in the opinion of the Germans) into a tussle between the team of forty-three cars from the Mercedes, Benz, and Adler factories against the twelve Daimlers from Coventry. We have spent this morning in a more or less ill-lighted building with a name nearly as large as itself—to wit, the Landwirtschaftlichen Halle; have been introduced to our observers; have received insurance tickets against the creation of widows and orphans, as provided for by the beautiful new law to encourage motoring in Germany; have learnt that we start at 5 o'clock in the morning from the third kilometre stone on the Hanau Landstrasse; have scrimmaged, under the captaincy of Mr. Julian W. Orde, in real Rugby fashion to obtain our guide maps, contour books, name plates, and so forth;

The Herkomer Trophy.

FIRST DAY.—Frankfort to Munich, 252 Miles.

MUNICH, Wednesday, June 6th.

No fewer than 133 of the 156 entrants left this morning at 4 o'clock. The weather, which had been overcast here for weeks past, was very fine, nor, as the day unfolded, was the promise of morn spoiled. There are several features which distinguish this competition from last year's, notable among them being that no compulsory halts are arranged between setting forth in the morning and finishing at night. The cars were started according to their engine capacity, a rule which will be observed throughout, no matter in what order the vehicles may arrive at the official garage overnight. A point about the competition is the advantage that has been taken by one or two firms of the fact that no special marks are given for body work. Several machines were brought to the starting lines having canvas flaps in place of side doors to the tonneau, others lacking any other than grey paint, a third variety having coachwork of one colour on a chassis of another. A number of these machines were disqualified on inspection but by a blunder the 90-h.p. Mercedes, handled by the professional Hieronymous, was inadvertently chalked when brought up for inspection, and as the Committee did not like to appear not to back up one of their members, it was decided that it should run, though under the distinct understanding with Mr. Julian W. Orde, as representing the A.C.G.B.I., that should it win any prize whatever a strong protest would be entered. The Imperial German, Bavarian, and Austrian Clubs Committee will have to take drastic measures next year if this competition is to attract a large entry list, a goodly proportion of

Prince Henry of Prussia on the Benz Car he has driven in the Trials.

have seen Prince Henry of Prussia, in the pink of condition, drive up on his Benz car and go through similar formalities to ourselves; have had the honour of our machines being inspected and admired by him; and are ready to start!

which is composed of genuine amateurs. Prince Henry of Prussia is, of course, the head of all these in the present event, and, as showing his keenness and dexterity, it may be set on record that though he started

seventy-fifth, he was among the first dozen to arrive in Munich this afternoon, as were nearly all the members of the Daimler team, though it was a matter for general condolence that such a magnificent sportsman as Mr. Charles Hardy, the President of the Nottinghamshire Automobile Club, should be the one for ill-fortune to single out thus early for her own, owing to a leak arising in connection with the water circulation, and of such a nature that it was decided to withdraw the car from the competition. As for the newcomers to the British team—Lord Montagu of Beaulieu, Captain David Hughes Morgan, and Messrs. Arthur Birtwistle, Robert Stotesbury, George Frederick Heublein, A. D. Grigg, and the Cavalier Gino de Martino—each drove magnificently, while the veterans, Mrs. Edward Manville and Messrs. Frank Rendle, W. Herdman Ash and Philip Dawson, handled their respective cars in a manner that showed they perfectly understood the game they were playing. While the white vapours of early morning still hung along the Valley of the Maine, people lined the way for mile after mile of the somewhat bumpy road. As we spun along the roads, often travelling at 60 miles an hour in order to keep our allotted distance from the car ahead, and so as to give no excuse whatever for the adoption of racing tactics on the part of the competitors behind us, it was difficult not only to realise the rate at which we were travelling so smoothly,

mountain ranges to the right of us and realised that we were now really in Bavaria. The only incidents to mar our complete enjoyment of the run were those occasioned by the scorching tactics adopted by the continental cars, whose drivers proceeded from the very starting line with open exhausts. It is the more surprising that they were allowed to do this in that the rules of the competition distinctly set forth that as the cars have to be legitimate touring machines they must be fitted with efficient silencers, while, as these daily stages are not races, it does not speak over well for the qualities of modern motor-cars, when it is presumably essential that they cannot be run efficiently except in such annoying fashion. Furthermore, the clouds of blue, black, and yellow exhaust emitted by three-fourths of the cars on setting out have become so objectionable that the officials have come to the conclusion that next year the regulations must include penalisation for all machines emitting obnoxious odours, smoke, or noises. We had some fine hills to climb to-day, but they offered no hard task to the Daimler cars. Towards Saalburg some of the mountains rose up almost sheer from the roadside and loomed right over us. Here, too, having entered Austria at Saalbruck, we had to be careful to bear in mind that we had now to observe the English rules of the road. The road surfaces improved towards the end of the day's stage,

Some of the Cars Awaiting Registration at Frankfort-am-Main.

The Organising Committee Inspecting one of the Daimler Cars.

but also that we were doing a considerable amount of up-hill work. We ran nearly all day with the sun in our faces, having alternate prospects of hills and levels, pine woods and pastures, school children shouting themselves hoarse, and competitors scorching along on cars innocent of silencers, despite the distinct regulations for enforcing the equipment of such. Unfortunately, scorching became almost as bad as last year, and has resulted in a serious accident, whereby Herr Schloer, the honorary observer on the N.A.G. car entered by Herr A. Kienle, was badly injured, owing to the vehicle smashing up in taking a corner too fast about twenty-five miles from Nuremberg. The first car to arrive at Munich was Herr Poege (60-h.p. Mercedes), followed by five other Mercedes cars. Herr Ladenburg, the winner of the trophy last year, was unfortunately unable to start, owing to an accident to his car. It is stated that altogether 128 of the competitors safely reached Munich.

#### SECOND DAY.—Munich to Linz, 168½ miles.

LINZ, Thursday, June 7th.

Happily there are no mishaps to record in connection with the run from Munich here to-day. As we left the prosperous capital of Bavaria in fine weather there was a cool wind that added to the pleasures of motoring, while the rain overnight had laid the dust splendidly. Presently we had prospects of

and in due course the British team all arrived at this centre of the silk industry. Prince Henry of Prussia was among those who dined in the plain little room where the British contingent attended to the inner man, and won yet greater admiration by his absolutely charming and unassuming manners. In this connection a little incident, among a score that might be cited, may be recalled. Finding Mr. Arthur Birtwistle waiting, seemingly puzzled, in the hall of the hotel, Prince Henry went up to him and said in English, "Are you all fixed up comfortably as regards your rooms, or can I be of any service to you in the way of interpreting?"

#### THIRD DAY.—Linz to Vienna, 115½ miles.

VIENNA, Friday, June 8th.

There was the usual scene of animation before the start from Linz this morning; while the fact of the overnight announcement that the Danube is so swollen that the route just outside the Austrian capital might have to be altered, because of some of the bridges being under water, lent an element of curiosity concerning the day's work ahead that made one forget that this was the third night in succession on which we had risen from our beds after enjoying anything from three to four hours' sleep. In the garage it was plain to see that matters were conducted in a somewhat lax fashion, for immediately on the doors being opened the competitors and their motor-

men seized their bags and trappings and made each for their cars, where they commenced operations, leaving their observers to single them out as soon as it should suit them. The replenishing of petrol and lubricants was arranged for in a large open space just outside the motor house. Here the Daimler contingent had a huge section boarded off for themselves, and one beheld Lord Montagu of Beaulieu in his shirt-sleeves and engaged as actively as any mechanic with an oil-can, with which he was making darts at all the various parts of the motor that had to be oiled, what time the observers stood regarding their books and their cars by turns, for it was plain here as well as in the general replenishing ground that by far the majority of those gentlemen had never set eyes on the regulations before seating themselves on the cars that had been allotted to them. At the starting line one beheld many sights of interest in the brief intervals which occurred between being enveloped in the clouds of murky exhaust that issued from the bulk of the cars. As usual, Prince Henry was in readiness as early as any of the competitors, and occupied the wait previous to his turn for being started off by chatting with one and another, as on the two opening days. He spent ten minutes in conversation with Mrs. Edward Manville, whom he complimented highly on her skilful driving, then observed, "I have been struck by the considera-

of the passengers on the car remained in the town and the rest proceeded. Ten minutes after their departure the injured man suddenly expired. Lunch was taken at Melk, and on resuming the road for the final sixty miles to Vienna we had to negotiate several hairpin corners, in one of which a great number of competitors had evidently come near colliding with the bank. This was scarcely surprising when it is borne in mind that the road surface resembled a shallow lake of greasy mud. A series of pretty woods and stretches of grey road brought us to the *pave* and the tram lines, which are so characteristic of this city, even as are the fine houses, the ornate harness of the horses, and the inhabitants, whose features are as fine as are their figures. The first to reach Vienna was Herr Dreher (Mercedes). Mr. Robertson Grant on the Argyll, and nine of the Daimler team safely arrived in good time, eight having accomplished non-stop runs on all three days.

#### THE HALT AT VIENNA.

VIENNA, Saturday.

This is an "off-day" from the competition. The competing machines have been washed, and are on exhibition in the buildings of the K.K. (everything is K.K. in Austria)—*Landwirtschafts Gesellschaft* in the Prater, near the Rotunda, so that, though all the foreign competitors would fain be able to take their machines

A General View of the Town of Aschaffenburg, passed through by the competitors on the First Day.

[Allgemeine Automobile Zeitung, Berlin.]

tion with which all the English competitors have been handling their machines throughout, and my only regret is that I am unable to say the same concerning the majority of the others who are figuring in these runs. I exceedingly regret the scorching that has been taking place, and have heard many complaints about it." There was nothing remarkable about the journey until we had passed out of Kleine Erla, when we suddenly found ourselves fronted with the steepest gradient that has been encountered since leaving England, but which afforded us an agreeable opportunity of proving the unusually fine picking-up qualities of the new 45-h.p. Daimler. We proceeded without incident until entering Melk, which is half-way between Linz and Vienna. Here we learnt of the second serious disaster that has occurred since the start of the competition. It appeared that while passing the post-office at the crest of the roadway in the main street a townsman of fifty years of age, who was blind and deaf, came out from behind a cart immediately in front of Mr. Max Krone's 20-24-h.p. Solidor car (No. 148), and though that machine was proceeding slowly and the brakes were jammed on so that it pulled up within 10 ft., the man was knocked down and the near side front wheel passed over his body. He was able to get up, however, but it was found that some of his ribs were broken. One

out to the Semmering to study the road for to-morrow's hill climb, it is impossible for them to do so. Of course, the Austrian and German competitors have no anxiety in this matter, since by far the majority of them know the scene of many a famous hill-climbing competition as well as they know the particular towns in which they live. As the gradient is such that it can scarcely be called a hill, the whole aim to be kept in view in driving is the negotiation of the hairpin bends, of which there are six. Knowing the handicap they have by reason of their ignorance concerning this course, the British competitors have made an excursion to it to-day on such old creaks of cars as they could hire for trifles ranging from £8 to £10 apiece for the day. It was a comical sight to see the company mounted in such sorry fashion after the superb and handsome vehicles they had been travelling in hitherto. We do not propose to describe the scene of to-morrow's hill climb, because it will be necessary to do so in connection with the event itself. Save Mr. Charles Hardy, whose ill-luck has already been reported, the cars of the British contingent are all running well. Thus there are twelve Coventry-built Daimlers and Mr. E. J. Robertson Grant's little Argyll to put up what performance they can on behalf of the home industry against the foreign. As to the drivers, it is now possible to

form some opinion of their relative methods. For instance, Mrs. Edward Manville has every chance of success in the fact that so far the competition has not fatigued her in the least, and that her car is running perfectly. Lord Montagu of Beaulieu is driving with the knowledge and knack of a pioneer motorist. He is pursuing tactics of his own by refusing to run all day in the cloud of dust occasioned by the scorching tactics already alluded to. After being sent from the starting line he drives each morning to his hotel for breakfast, picks up his luggage, then pursues the road in peace and quietness.

#### FOURTH DAY.—Vienna to Klagenfurt, 192½ miles.

KLAGENFURT, Sunday.

To-day's journey included the timed hill-climb up the Semmering, a long pull-up with a number of sharp turns. The timing was over a distance of about 6 miles, and took in gradients varying from 1 in 14 to 1 in 6. Lack of flags on the "hairpin" corners on the course proved a great handicap to the foreign competitors, and was the cause of several accidents, Mr. Arthur Birtwistle's and the Chevalier Gino de Martino's Daimlers being placed *hors de combat*. Herr Vogel, on a 45-h.p. Adler, in trying to avoid the others, ran into the bank and smashed the front of his car. Fortunately, no one was hurt.

between Brennerbad and Brenner itself. The mountainous road was extremely beautiful and interesting, these being points which have been specially considered when determining the selection of route. Altogether 102 cars left Klagenfurt this morning, the first to reach Innsbruck being Herr Wiegand on a 60-h.p. Mercedes. All the British vehicles have come through to-day without any loss of marks. One or two accidents are reported, a Benz car having fallen into a ditch and a Metalurgique collided with a tree.

#### LAST DAY.—Innsbruck to Munich, 94 miles.

MUNICH, Tuesday.

With less than a hundred miles to run it might be thought that the concluding day's run was the lightest of the series. As the event proved, however, it was the most difficult of any, for we had only gone about eight miles from Innsbruck when the steepest gradient included in a competition of this sort was encountered, the three mile rise by the Hohe Fluide to Seefeld having a mean ascent of one in four with stretches of one in three. To-day's journey also included a flying start speed contest in the Forstenrieder Park, near Munich. The measured distance was over a fairly level stretch, about 3½ miles long, a downhill gradient behind the starting point allowing

Sixs at the wheel of the new Renault 105-h.p. Racer he will drive in the forthcoming contest for the A.C.F. Grand Prix.

Mr. Herdman Ash also met with a bad accident at another of the nasty bends, three Daimler cars being thus put out of competition. The other British competitors did better performances in the hill climb than was expected, Mr. E. J. Robertson Grant, on his 16-20-h.p. Argyll, doing a splendid performance, whilst Mrs. Manville and Mr. Grigg, on the two smaller-powered Daimlers, improved on the speeds set out by formula. The first arrival at Klagenfurt was Captain Spitzner on a 60-h.p. De Dietrich, Herr Wiegand, 60-h.p. Mercedes, being second, and Herr Dahmen, on a 60-h.p. Benz, being third. Up to 9 p.m. 106 vehicles had arrived here. Rain has been falling in torrents.

#### FIFTH DAY.—Klagenfurt to Innsbruck, 207½ miles.

INNSBRUCK, Monday.

With the completion of the fifth day's stage the competition is within appreciable distance of finishing, for to-morrow's short but difficult stage will see it end at Munich. To-day's journey was not only long but difficult, although the road surfaces were, on the whole, considerably better than yesterday. The way rose from a height of 370 metres, at which we were when we set out, to 1,100 metres at Innichen, then dropped to about 700 metres at Ober-Vintl, rising again to 1,200 odd metres

the cars to get up a good speed. The first to pass the station, where the arrival of the cars was recorded, was the 60-h.p. Mercedes, driven by Herr Weingand, which covered the measured distance in 3 min. 31 sec., followed by Mrs. Maud Manville, whose 35-h.p. Daimler took 3 min. 37 sec. Of the first twenty cars which had passed over the course by 1.5 p.m., the best time was made by the Mercedes driven by Herr Poege, which covered the distance in 3 min. 8 sec.

Prince Henry of Prussia, who arrived at 1.45 p.m., covered the course in 3 min. 54 sec.

The following are the times of some of the other British competitors in the event:—Lord Montagu of Beaulieu, 3 min. 22 sec.; Mr. W. Rendle, 3 min. 40 sec.; Mr. A. D. Grigg, 3 min. 40 sec.; Mr. W. H. Ash, 3 min. 43 sec.; Mr. R. Stotesbury, 3 min. 55 sec.; and Mr. G. F. Heublein, 4 min. 27 sec.

A GOLD medal has just been awarded by the jury of the Milan International 1906 Exhibition for Hopkinson's patent solid tyre, for motor-buses, commercial vehicles and pleasure cars. This is, we are informed, the highest and only award given for solid tyres.

## CONTINENTAL NOTES.

## The Paris-Tourcoing Industrial Vehicle Trials.

An interesting trial of industrial motor vehicles, organised by the Automobile Club du Nord de la France, has been in progress during the past week. Altogether twenty-nine entries had been received, and of these the following twenty-five actually started:—Class 1.—12-24-seated public service cars: Clement-Bayard I. and Delahaye. Class 2.—Double-deck 'buses': Clement-Bayard II. and Brillie I. Industrial vehicles: Class 1.—Tri-cars carrying up to fifty kilog.: Three Contals and three Australs. Class 2.—Commercial vehicles for loads from one to two tons: A Peugeot, a Clement-Bayard, and a Latil *avant-train*. Class 3.—Ditto from 2 to 3½ tons: An Aries, a Brillie, an Auto-Camion, a Latil, a Louet-Badin, and a D'Espine-Achard; and Class 4 ditto, 3½ tons and over, a Janvier six-wheel lorry, a Latil, a Prunel, a Peugeot, a Brillie, and a Mors. The trial started on the 6th inst., with a run from Paris to Pontoise, a distance 30½ miles; Beauvais, 31½ miles, was the destination on the 7th inst.; Amiens, 36½ miles, on the 8th inst.; Arras, 42½ miles, on the 9th inst. Up to this point only two vehicles—the Auto-Camion and the D'Espine-Achard—had fallen out. On Sunday Tourcoing, 45 miles, was reached, and on Monday a round trip of 42½ miles from Tourcoing to Tournai and back was made, a different circuit slightly shorter in length being covered on Tuesday. The

social functions of the Paris season, and is attended by the fashionable and wealthy residents, both French and foreign. Five prizes were given on this occasion, one of which was for electric cars. Of the other four, the first and only prize given for silent motors was awarded to a Hotchkiss car, the property of Mr. Herbert Ward, the well-known sculptor. The medal known as the Prize of Constructors, given for general excellence, was presented to the Hotchkiss Company, as represented by the car belonging to Mr. Charles Fallow. Of the other two prizes, one for elegance was divided between a Gobron-Brillie and a Renault.

## Motor-Bicycle v. Express Train.

A Danish motor-cyclist named Stuhr recently succeeded in beating the express train between Frederikshaven, the most northerly town in Denmark, and Copenhagen, the capital. The distance between the two places is 362½ miles; the express train leaves at 6.24 a.m., and is due at 8.49 p.m. Mounted on an Adler machine Herr Stuhr left Frederikshaven at the same time as the train, and, experiencing no trouble of any kind on the way, arrived in Copenhagen 24 min. in advance of the express. His time was just a minute over fourteen hours, the average speed working out at nearly twenty-six miles per hour.

## Motor-cars in the Police Service.

Motor-cars are to be used for police purposes in Prague, Bohemia. The Chief Constable has arranged for the purchase of a powerful vehicle capable of carrying twelve or fifteen men,

The Start of the Paris-Tourcoing Industrial Vehicle Trials.

results of the trial are not available at the time of going to press, and will be given in our next issue.

## The Scheveningen Automobile Meeting.

The programme of the automobile fetes to be held at Scheveningen, the popular Dutch seaside resort, under the auspices of the Dutch Automobile Club, from July 9th to 12th, has now been issued. The meeting will open on the 9th with a reception and banquet. On the 10th there will be a motor-carriage body competition, prizes being offered for the best design of (1) two or four-seated touring car without hood or canopy; (2) double phaetons and demi-limousines; (3) limousines, coupes, landaulets, and (4) town cars. In the afternoon of the same day a series of kilometre speed tests will be held on the promenade from a standing start and a flying finish, categories being provided for motor-bicycles, cars from 400 to 650 kilogs, vehicles from 650 to 1,000 kilog, and touring machines. The proceedings on the 11th will consist of a driving competition, a gymkhana, and a procession of illuminated cars, while on the 12th there will be an automobile battle of flowers.

## Polo and Motor-Cars.

The annual automobile reunion at the grounds of the Polo Club, in Paris, was held a few days ago. This is one of

which it is expected will prove useful in transporting them in the speediest manner to points where they may be required in the case of any disturbance.

## A Motor-cycle Race for Schoolboys.

A motor-cycle race for schoolboys is being organised by the "Auto." It is to be held on the Parc des Princes track, in Paris, on the 21st inst., and the competing machines must be fitted with engines of not more than 3-h.p.

## Miscellaneous Items.

In a series of flying kilometre speed trials at Rouen a few days ago the best time—39 4-5 sec.—was made by M. Coquard on a 35-h.p. Aries.—Owing to the cars being sold, and the manufacturers being consequently unwilling to keep them on view any longer, the automobile section of the Milan International Exhibition was closed last week-end.—Owing to many complaints of furious and careless driving in the Versailles district the Prefect of the Seine-et-Oise district has issued a regulation limiting the speed of motor-cars in the town to 15 kilometres (9½ miles) per hour.—Steps are being taken at Varel, Oldenburg, to form the North-West Germany Automobile Club.—The first permanent service of motor-omnibuses in Paris began running on the Montmartre-St. Germain-des-Près route on Monday morning.

## THE SCOTTISH TRIALS.

GLASGOW, Tuesday.

ERE these lines appear in print more than half of the Scottish Reliability Trials will have been undergone, and the long pilgrimage will be coming southward from Aberdeen and the delightful regions round about. As a test of cars and drivers last year's route was regarded as unique; the journey of this year is officially declared to provide a "yet severer test of the competing vehicles."

The principle guiding those responsible for the rules of the Trial is that the venture is a competition of reliability, the object being to demonstrate the capability of the modern motor vehicle for touring purposes. Hence the importance, both from the public and the manufacturers' point of view, of the important variation of this with the 1905 trial, in the fact that an absolute non-stop performance is not now essential to eligibility for a medal award. This is a sensible innovation, when we recall the failure of competitors last year to gain awards merely because of the loss of a mark or two, such as did not arise from any mechanical flaw, but merely the "hard luck" that seems inevitable to some deserving competitors in such a trial as that upon which we are engaged. There are

Fig. 1.—The Argyll 14-16-h.p. Car, No. 16 in the trial. The vehicle is fitted with one of the new Argyll motors constructed at the works at Alexandria.

eighty-four entries, divided as follows:—Cars of which the chassis price does not exceed £200, eight; between £200 and £350, fifteen; between £350 and £500, twenty-two; between £500 and £550, twenty-seven; and over £650, twelve.

The seating capacity of all in the first category, with the exception of the 14-h.p. Pope Tribune, is two. The latter seats four passengers, as do all the other cars in the Trial save the 10-h.p. Alldays (three), the 20-h.p. Calthorpe (five), the 30-36-h.p. Drummond (five), and the 24-30-h.p. St. Vincent (six).

Of the eighty-four cars there are seven six-cylindered vehicles, viz., the Calthorpe, Brooke, Standard, Rolls-Royce, Beeston-Humber, Belsize, and Ariel-Simplex cars. In b.h.p. the range is between the 6-h.p. Rover and the 45-h.p. Belsize. The diameter of cylinders and stroke of pistons given by the makers afford opportunity for some interesting comparisons, of which one occurs at the moment, the Scottish Aster, with 12-14-h.p., being 95 mm. by 130 mm., and the Victoria, of similar horsepower, being 80 mm. by 90 mm.

Interesting observations will be possible with regard to tyres, the 16-h.p. Kelvin being fitted with Gaulois, the new Arrol-Johnson dog-cart with Shrewsbury and Challiner, the 16-20-h.p. Argyll with Le Persan, the 18-24-h.p. with Moseley, as is also the 24-34-h.p. Belsize. Other competitors favour the Continental and other well-known makes. Desclee non-skids,

Wallwork bands, and Samson non-skids are being employed by some of the competitors.

The climatic conditions have resembled those of southern climes rather than of northern latitude, and everyone is remarking upon the heat and dust that has arisen outside Glasgow. The cars as they arrive are being driven to the fine

Fig. 2.—The chassis of the 24-h.p. Albion car which started first in the trials.

garage of the Western Motor Company, in Berkeley Street. Most were in good time, but Mr. Ross Browne, of Nottingham, who will handle the Brasier car, was late, owing to the difficulty of getting his car from Paris. By driving all through Monday night, however, he has been able to get to his stall in the garage. The most notable absentee is the Italian car. American activity is indicated in the presence of the Reo—quite a new car to this country—Cadillac, Maxwell, and Pope-Tribune. Our columns have lately pointed out the special features of practically all the cars that will go upon the road to-morrow morning, and it now only remains to be weighed on the official scales and advised, with the Observers, as to what can be, and what ought not to be, done during the trial.

Very complete arrangements have been made for the efficient carrying through of the programme, the total mileage of which is 671½, the longest journey being that of Thursday, which includes the hill climb by the Spittal of Glenshee. For the benefit of our Scottish readers who may go out to greet the cars on their return to Glasgow on Saturday, an approximate time table may be helpful:—The cars will commence leaving Pitlochry at 6 a.m., and quite an hour will elapse before the last arrival on the evening before gets away. The leading vehicle may get to Killin (50 miles) by 8.40 a.m., and be at Inverary (69½ miles beyond Killin), by 11.10 a.m., arriving at Arrochar, 118 miles from Pitlochry, by 1.25. Under no circumstances can

Fig. 3.—The 16-h.p. Reo Car entered by the British Reo Motor-Car Company.

This is the first public appearance of this American-built car in this country. It is fitted with a horizontal opposed double-cylinder engine, 4½ in. bore by 6 in. stroke. The change-speed gear is of the planetary type, giving two speeds forward and a reverse, the final drive being by a single chain on to a live axle.

the cars get back into Glasgow before 3.30 p.m., proceeding at once to the Storage Department in Berkeley Street.

During the long journey the supply of motor spirit, lubricants, etc., will be a most important matter. At Glasgow and Edinburgh this is being undertaken by the Western Motor

Company, Ltd., and Messrs. J. Croall and Sons, Ltd.; at Aberdeen by Messrs. Claud Hamilton, Ltd., and the Caledonian Motor Car Company, Ltd.; at Dumfries by Mr. W. Irving; at Blairgowrie by Mr. W. Crockett, jun., and Mr. R. Raitt; at Grantown on Spey by Mr. G. Anderson and Messrs. M'Dougall and Co.; while Fisher's Hotel and Messrs. Blues and Shillinglaw will provide supplies at Pitlochry, and the Argyll Arms Hotel at Inverary.

[BY TELEGRAPH.]

DUMFRIES, Wednesday.

It transpired this morning that the Marchand car had been withdrawn owing to inability to obtain the vehicle in time. The Calthorpe is also a non-starter, it having run into a wall near Penrith on the way from Birmingham. The remainder of the cars duly started from Glasgow this morning, the Albion leading, being despatched by Mr. John Adam at seven o'clock, the others following at minute intervals. The morning was cold and grey, and it was a cheerless procession that threaded its course over the tramlines of Glasgow out into a somewhat dreary country. Evidence of dusty roads quickly rose, and within an hour from the start bearded drivers and passengers had become prematurely aged in appearance owing to the pale dust which covered them. In the first ten miles we, on Mr. Ross-Browne's Brasier, passed two victims of tyre troubles—the St. Vincent, No. 48, and the Ariel-Simplex, No. 50. A few red triangles were also seen, and at Fenwick the residents had watered their winding street, through which all went slowly, the Scottish authorities having sanctioned a ten miles an hour limitation. Kilmarnock was reached shortly after nine, and then we were soon out into the country again, with a keen wind helping the dust disturbance. The only sun observable, so far, was when entering the Burns country. Never has such a dusty crowd entered Dumfries as the motorists, about sixty of whom arrived by 1 p.m.

OWING to its conveniently located position, Willesden Junction is rapidly becoming a motor manufacturing centre, several works being now located there. About 15 acres of land are, we learn, still available for the establishment of a large factory,

## THE BROOKE 25-H.P. SIX-CYLINDER CAR.

It has been known for some that Messrs. J. W. Brooke and Co., Ltd., of Lowestoft, were engaged on the construction of a six-cylinder car, and this week we are able to give some particulars and illustrations of the new models, one of which is taking part in the Scottish Reliability Trials at present in progress. The introduction of the new vehicle, apart from

Fig. 1.—General View of Inlet Valve side of Brooke Six-cylinder Engine.

the engine, marks a departure from the usual Brooke practice, chain transmission having been abandoned in favour of a cardan shaft and live axle, while in the several details a number of interesting points are embodied. The frame, which is of pressed steel construction, is of equal width throughout, the forward ends being extended to form the dumb-irons. At the rear the side members of the frame are raised in order to give ample clearance for the differential case of the rear live axle. The

Fig. 2.—Chassis of Brooke 25-h.p. Six-cylinder Car.

particulars of which can be obtained from the solicitors, Messrs. Collins and Cook, 238, Edgware Road, London, W.

WE have received two interesting little pamphlets from the Electrician Printing and Publishing Company, of Salisbury Court, London, E.C., entitled respectively "Electric Automobiles" and "Electric Ignition." The former is by Mr. Mervyn O'Gorman, and the latter by Mr. W. R. Cooper, both publications being but selections from a long series of "The Electrician" primers devoted to various technical subjects.

rear dumb-irons are long, and curved outwardly to accommodate springs of good length, and bringing the driving axle well to the end of the frame, so as to give a good distribution of weight. The front wheels are carried on a forged axle having forked steering centres running in ball races.

Several views of the engine are shown in Figs. 1 and 4, from which it will be seen that the six cylinders are cast in three pairs; they have each a bore of  $3\frac{1}{8}$  in. by  $4\frac{1}{2}$  in. stroke, 28-h.p. being developed at a speed of 1,000 revolutions per

minute. The valves are interchangeable and symmetrically arranged on opposite sides, and are mechanically operated from their respective cam shafts. The aluminium crank chamber is divided into three compartments, so that the oil supply for all the cylinders is kept practically at the same level. The crank shaft is of nickel steel, and is supported by bearings between each throw. The cam shafts, together with their cams, are all milled from the solid, and the half-time gear wheels are enclosed within the crank chamber. A governor of the centrifugal type acting on the admission is mounted on the inlet valve cam shaft. The mixture for the six cylinders is furnished by a single carburettor; the latter is of novel design (Fig. 3). The petrol enters from a

Fig. 3.—Transverse and Longitudinal Sections of Brooke Carburettor.]

float-feed chamber into a horizontal cylindrical casing fitted with three shutters. The central shutter serves to concentrate the air about the jet below it, while that on the right adjusts the air supply, and the one on the left the gas passing to the engine. These shutters are coupled up and operated together by means of a spindle and lever, and their shape, as can be seen from the two transverse sections, has been so designed as to give the correct proportion of air and vapour under all conditions. A jacket surrounding the exhaust pipes from the forward cylinders provides for the warming of the air previous to its entering the carburettor. In place of the low-tension magneto previously used on Brooke cars ignition by high-tension magneto has been substituted, the plugs being situated immediately over the inlet valves. The water circulation is maintained by a combined honeycomb radiator with air-inducing fan, and a pump formed in the crank chamber, and positively driven by an enclosed gear wheel from one of the half-time shafts. A lubricator is fitted to the dashboard, having three drip-feeds, one for each crank chamber division, the oil being forced to the drips by the pressure employed to maintain the petrol supply to the carburettor. A hand pump for lubrication purposes is also mounted on the dashboard. The petrol is

Fig. 4.—Transverse and Longitudinal Part Sectional Views of Brooke Six-cylinder Motor.

pressure-fed to the carburettor, and is carried in a copper tank of fifteen gallons capacity at the rear of the chassis.

Passing now to the transmission, the power of the engine is transmitted through a clutch of the Bradley multiple-plate type with separating pins. The gear-box, a sectional view of which is given in Fig. 6, is supported at three points from cross members of the frame, and provides four forward speeds and a reverse. The gear changing is controlled by a lever working in a gate quadrant. A slight movement only of the change-speed lever results in the gears being completely engaged by means of a spring device located in the gear-box; it is claimed that by this construction absolutely silent gear changes are provided. In Fig. 6

three striking-rods will be observed—one operates the reverse motion and the other two the first, and second forward speeds, and third and fourth respectively. A feature of the gear is that a direct drive is obtained on the third speed, this being designed to give a speed of forty-three miles per hour with full load on the level, the indirect fourth giving still higher speeds when required. A universally-jointed shaft conveys the drive from the gear-box through bevel gearing to the rear live axle, which is

Fig. 5.—Sectional View of Live Axle. The left-hand portion of the drawing is in plan, and the right in elevation.

hung from springs shackled at either end, and tied to the frame by radius rods located directly below the side members. The rear wheels are mounted on ball bearings on the axle sleeves, the drive being transmitted through the ends of the live axle. The latter has thus only the driving effort to transmit, the weight of the car being carried by the sleeves, which have been pressed to the shape shown in Fig. 5 from Mannesman steel tubing by specially-made dies. The thrust of the bevel drive is taken by the sleeve enclosing the cardan shaft.

As regards the brakes, a foot-operated brake acts on a drum located immediately to the rear of the gear-box, while a hand lever actuates compensated internal expanding brakes on the hubs of the rear road wheels. The speed of the engine is con

Fig. 6.—Part Sectional Plan of Gear Box.

trolled by a lever on the steering wheel acting on the throttle; an accelerator pedal is also provided to cut the governor out of action when desired. The steering is of the usual irreversible type, and it will be noted that the steering bar is located at the rear of the front axle. The car has a wheel base of 10 ft., which, in view of the relatively short length of the bonnet for a six-cylinder engine, enables a roomy side-entrance body to be fitted. We may add that, as shown by the drawings, ball bearings are fitted to all the shafts and axles, except those of the engine. As already mentioned, one of the new Brooke six-cylinder cars is taking part in the trials in Scotland, where it is attracting considerable attention.

A MOTOR charabanc is now running regularly between Girvan and Ballantrae.

ON Thursday next Messrs. Sydney Lee and Co., Ltd., are selling by auction, at their depot at Augustus Street, London, N.W., the stock of a motor and accessory dealer, comprising all kinds of parts and fittings and a 12-16-h.p. car.

THE Hutchinson Tyre Company have opened West End showrooms and offices at 13, Maddox Street, London, W.

A PROCESSION of motor-cars will escort Mr. J. Chamberlain round the principal parks in Birmingham on the 7th proximo.

Engine of the Adams-Hewitt 10-h.p. Car described in last issue.

A FURTHER wonderful discovery by Edison, which is expected to "bring the price of automobiles within the reach of many more persons," is reported from New York.

At the statutory general meeting of the All-British Car Company held in Glasgow Mr. A. L. Drysdale referred to a contract for 250 motor-buses which has been obtained.

THE Dumfries Iron Foundry Company, of Dumfries, have a plant of gear-cutting, milling, and grinding machinery for motor repair work, of which they make a special feature.

At Beaconsfield, on Tuesday, penalties to the extent of £57 were imposed upon motorists, mainly for exceeding the legal limit. It transpired in one case that the constable who gave the signal was pretending to mend a puncture, and that he stood upright as the car entered the trap.

THE American Daimler Company is bringing an action against the Corbin Motor Vehicle Corporation, of New Britain, Conn., to restrain them from using a method of interlocking change-speed gear controlling mechanism, which is alleged to be an infringement of one of the Maybach-Daimler patents.

ON Wednesday last week the Burnley Motor Pleasure Company, Ltd., inaugurated a pleasure service between Accrington and York, which is to be repeated every Wednesday throughout the summer. The vehicle employed was built by the Critchley-Norris Motor Company, of Bamber Bridge.

AN interesting comparative trial between a 30-40-h.p. four-cylinder Martini car and a 30-h.p. six-cylinder Rolls-Royce is at present in progress, under the observation of the A.C.G.B.I. At the end of the third day's run the Martini had secured most points as regards hill climbing, speed on level, and fuel consumption, while the Rolls-Royce leads with respect to changing gears during hill climbs and involuntary stops.

THE Lacre Motor Car Company, Ltd., whose capacious premises in Poland Street, Oxford Street, W., are well-known among London motorists for their up-to-date equipment with regard to accessories, both for the man and the motor, are devoting special attention to hoods and canopies for motor-cars of every degree. These are designed and constructed on the premises, and the firm are well able not only to make special hoods for particular purposes or requirements, but to supply from stock hoods for any type of body. We have lately seen in their showroom some excellent canopies with special fittings, rendering them easily detachable, and yet strongly held in position when fixed. Motorists communicating with the Lacre Company will find them well able to cater for all requirements.

## HERE AND THERE.

At the agricultural motor trials, promoted by the Suffolk Agricultural Association, held last week at Ipswich, the first prize of £15 and the diploma of merit was won by the Ivel agricultural motor for the

best combination of machinery for ploughing by power other than horse.

MR. A. MORTON has a motor repairing shop at 23, Alloway Street, Ayr.

A NEW motor garage has been completed at the Prince of Wales Hotel, Southport.

A WELL-EQUIPPED motor garage at Wexford is that of Messrs. Thompson Bros.

MR. J. MUNRO is erecting a motor garage at Breadalbane Street, Oban, with accommodation for a score of cars.

THE Cruden Bay Hotel, Port Erroll (thirty miles from Aberdeen), has a motor garage in charge of a skilled engineer.

ACCOMMODATION for motorists visiting Bolton can be obtained on the premises of the Bolton Mutual Garage, Ltd., in Byng Street.

ACCORDING to "Truth" it is now understood among motorists that when they are summoned before some magistrates in the South of England a conviction is practically inevitable, no matter how strong the defence may be, so that it saves trouble and expense to plead guilty.

MR. T. E. BAKER, of High Cross, Tottenham, who purchased an Albion car in October, 1904, informs us that he has run it over 12,000 miles, and not had a stop of any sort. He has used the vehicle, which is fitted with solid tyres to all four wheels, in three elections, one general and two local, which means hard work, has travelled over all parts of England, and has only just ordered his first pair of chains. Mr. Baker is his own driver and attends to the car himself in every way.

THE 1906 edition of the "The Automobile Handbook," issued by the Automobile Club and the Motor Union of Great Britain and Ireland, has just made its appearance. We hope to refer to it more fully in a subsequent issue, but may mention that in addition to giving particulars of the automobile organisations of the United Kingdom, and much information of interest to automobilists, it forms a complete guide to touring on motor vehicles in the United Kingdom and places abroad.

The 30-35-h.p. Metallurgique which did so well in the recent Frome's Hill Climb. The car, which is fitted with a heavy touring body and hood, accomplished the fifth fastest time, and was sixth in the open handicap. It is being driven in the Scottish Trials by Mr. O. Copper.

THE committee of the Greenwich Life-boat Saturday Fund are organising a procession of decorated motor-cars, etc., to be held on Saturday, the 23rd inst., starting from South Street, Greenwich, at 2.30 p.m., and making a circular tour of the borough of about four miles. A prize of £5 5s. will be awarded to the sender of the best decorated car, and the names of all the competitors will be duly published in the Press. Motorists willing to join in the procession are invited to communicate with the hon. sec., Mr. A. W. C. Schelff, at the Town Hall, Greenwich, before the 21st inst.

MESSRS. WILLIAMS BROS. have a motor garage near the pier at Lytham.

THE 45-h.p. Mercedes car just delivered to his Majesty the King is fitted with Continental tyres, which have been awarded a Grand Prix at the Milan Exhibition.

MR. R. D. ALDER, 36, Rectory Grove, Clapham, S.W., has been appointed sole selling agent for Wright's patent foot rest for motor-cyclists.

CONSIDERABLE automobile business on the easy payment system is being done by the Automobile Contract Company, Ltd., of 33, Old Bond Street, W.

THE Autocar Repairers have opened an establishment at 128, Fortune Green Road, Hampstead, where they are making a special feature of repairs to cars.

MESSRS. POWELL AND HANMER, LTD., have introduced a motor-bicycle head lamp or tri-car side lamp, designed to withstand the excessive vibration on a motor-bicycle head.

THE accompanying illustration depicts the 14-h.p. Germain chainless car recently supplied to Mr. J. Greenhalgh, of Heaton Chapel, by Mr. J. Garlick Looker, of the Heaton Moor Motor and Cycle Works, Stockport. The other Saturday, wishing to test the hill-climbing powers of the vehicle, Mr. Greenhalgh and Mr. Looker proceeded to Hatton Street, Stockport, one of the

steepest gradients in the district. Arriving there, they found the straight road at the bottom up for repairs, which compelled them to make a sharp turn to the left and to practically start on the worst part of the hill, only a few yards lower down than where the photograph reproduced herewith was taken. With four passengers the car took the hill easily; on the next run six were carried, and on the third trip eight. On the last trial the vehicle was stopped for the purpose of taking the photograph, after which it started again easily. Coming down the party had the chance of trying the brakes, and found they were quite capable of holding the car with its load.

WE have received a copy of the new price list of Messrs. Peto and Radford, Ltd., of Ashted, and Hatton Garden, E.C., containing many pages descriptive of goods which are entirely electrical. Particulars are given of accumulators made under five different patents, in types which are suitable for any purpose in automobilism. The list also contains interesting particulars of accessories, such as the electrical direction indicator, primary batteries for automobiles, and a considerable number of fittings suitable for the electric lighting of all forms of road vehicles. Illustrations and a full description of the Peto Cadett accumulators, showing methods of construction, add to the practical value of the work, and Messrs. Peto and Radford have evidently endeavoured to include in their list everything electrical which they consider good, and have eliminated anything which the past ten years' experience may have rendered obsolete.

MR. R. CREIGHTON has erected a motor garage in the Manchester Road, Nelson.

A MOTOR garage has been opened by Mr. S. Lomas in Gladstone Terrace, Woodford, on the border of Epping Forest.

MESSRS. FERGUSON, SHAW AND SON, of Glasgow, are introducing Aucarine motor oils and greases to motorists.

AN order for solid tyres has been received by the Sirdar Rubber Company, Limited, from the Royal Arsenal, Woolwich.

M. ALBERT MUFFAT, 35, Rue du Stand, Geneva, has been appointed agent for the sale of H.F. vulcanisers in Switzerland.

MESSRS. MERRYWEATHER, of Greenwich, have lately completed a 24-h.p. motor fire-engine for the fire brigade of Durban, Natal.

THERE are five toll bridges in the neighbourhood of Selby, viz., at Selby, Loftsome, Babwith, Carlton and Skeldergate (York).

MR. F. J. DEAN has a well-equipped garage in Upper Brook Street, Winchester, and is well able to undertake all kinds of motor-car repairs.

THE Edinburgh and District Motor Omnibus Co., Ltd., have been granted a warrant from the Edinburgh Dean of Guild Court to erect a garage at East London Street, Edinburgh.

A NEW motor garage has been opened at Bala, the proprietors of which, the Bala Motor Company, Ltd., have arranged for petrol depots along the Holyhead road between Llangollen and Bettws-y-coed.

A USEFUL paper on pneumatic tyres, based upon some observations made before the Eastern Section of the Scottish Automobile Club by Mr. C. R. Crombie, has been issued by the Victoria Rubber Co., Ltd., of the Victoria Indiarubber Mills, Edinburgh. The company is devoting much attention to motor-tyre repairs, and in their "Victoria Jointless" inner tubes have dispensed with the overlapping joint and valve patch, so that the tube presents an entirely uniform surface. The ends of the tubes are joined and vulcanised during the process of manufacture. There is, therefore, no possibility of their coming apart.

MESSRS. SMITH, PARFREY AND CO., LTD., have issued a neat list setting forth their ample facilities for repairing motor-cars at the Pimlico Wheel Works, Rannoch Street, Fulham Palace Road, Hammersmith, W. The site occupies four acres in extent, and the productions include artillery wheels, axles, springs, bent wood wings, mudguards, panels, &c. Their process of electric welding enables the firm to deal with a class of repair that would be impossible with the ordinary process of fire-welding, such as broken ends to crank-shafts, new stems to valves, &c. Altogether Messrs. Smith, Parfrey and Co. are rendering useful service to motorists.

MR. GROSE, whose name was early associated with the non-skid band, has maintained a position in the forefront of that branch of the industry by steadily aiming at perfection. His "Grose" band is notable for the formation of the leather into the exact curve of the tyre for which it is intended, thus securing neatness of appearance as well as effective operation. Now he has introduced a new ventilated non-skidding and puncture proof band, the innovation in which has been suggested by his own practical experience as a motorist. This is designed to obviate the difficulties caused by the overheating of the tyre, and also to prevent the band from chafing the latter. It can be fitted to any make of pneumatic tyre, and first there is the chrome leather cover, which is vulcanised on the ordinary tyre, and which is taken down over the beaded edge. Intermediate leathers are provided which prevent the rivets from injuring the rubber cover, and also absorb friction. The new feature is the provision of an air-space with ventilating eyelets between the leather tread and the tyre, thus considerably reducing the heat which must be engendered when the car is travelling. The idea is a good one, and its practical execution by Mr. Grose, whose first band was protected as long ago as 1897, has been well secured in the specimens we have seen. Messrs. Grose, Ltd., of Northampton, will be pleased to send further particulars to those interested in a very difficult problem.

## SOME CURRENT TOPICS.

### A Record Run from Monte Carlo to London.

The record for the journey by road from Monte Carlo to London has again been lowered. Mr. H. R. Pope, driving the Itala 24-h.p. touring car on which he took part in the recent Targa Florio contest in Sicily, and accompanied by three passengers, left Monte Carlo on Saturday last at 2 p.m., and reached St. James's Street, London, at 2.5 a.m. on Monday, thus occupying 36 h. 5 min. on the full journey, and beating the previous record by 1 h. 23½ min. As may be gathered from the fact that the last stage of the journey in France was done at an average speed of 47 miles per hour, the pace was pretty fast, but in the course of conversation with Mr. Pope on Tuesday he remarked that he considered it possible, given good luck, to perform the journey in much less time, as he experienced considerable delay—nearly four hours—owing to tyre troubles. The steamer on which the car was brought from Boulogne to

arr the rule, valve setting is anything but a simple matter except for the expert. There are, of course, general rules for the timing of the admission, the exhaust and the ignition, which are known to intelligent motor car repairers; but almost every manufacturer has developed, through experiment, rules of his own for valve timing which cause his particular type of engine to give the best operative results in practice. These different methods of individual factories cannot, of course, be known to the general repairer, and the result is that the new valve setting of a motor which has been dismantled in a local repair shop may possibly not be identical with that contemplated by the manufacturer.

### Some Hints.

It is astonishing how much difference in the action of a motor often results from the difference in valve action due to a change of even one tooth in the mesh of the half-time pinions. In engines provided with a single cam shaft, the time of admission and of exhaust in all cylinders is affected by a single error in gear mesh, and in those which make use of two cam shafts the timing of all the inlet valves or of all exhausts is dependent upon which one of two pinions is changed in point of mesh. Owing to their frequent inaccessible location it is not

Photo by]

The Start of the Auto-cycle Club's Reliability Trial from Land's End. (See page 354.)

[Paul Bros.

Folkestone, too, started nearly an hour late, while much time was wasted in landing the vehicle from the boat at Folkestone, and lamp troubles on the English portion of the journey rendered fast travelling out of the question.

### The Resetting of Valves and Ignition Gear.

The engine of every petrol car requires to be taken apart at some time in its life history in order that adjustments or replacements may be made or some bearing re-bushed. In this process of disassembling the pinions which operate the half-time shafts are often unmeshed, and no accurate marks are made to facilitate their correct re-meshing. The chances, then, are that the half-time gears may be incorrectly meshed when the engine is put together, with the result that the valves will not be properly timed and the ignition points thrown out of their proper relation to the cycle. The motor will probably run erratically, and with a serious diminution of power, under these conditions. In order to correct the defective adjustment much experimenting will be required and much time wasted, and very likely the final adjustment may not be exactly correct. Now that all valves are usually mechanically operated and that multiple cylinder engines

always practicable to mark the correct meshing point on the pinions themselves. The best practice to be followed to insure the correct retiming of valves after dismantling is to remesh the cam shaft gears by means of marks made by many manufacturers at the factory upon the rim of the flywheel. These marks are made to correspond with the periods of opening or closing of the exhaust and inlet valves of the several cylinders, and are read with reference to some index point fixed to a stationary part of the engine. When such marks, properly designated, are provided, it is an easy matter for any ordinary mechanic to restore the conditions of valve action contemplated by the maker of the engine. It is to be noted that this marking of the flywheel is being more generally attended to by manufacturers, and when it becomes the rule there will result comparative freedom from the cases of imperfect operation of motors, due to derangement of valve action, which at present are far from uncommon.

To the Defence Fund of the Motor Union the Continental Tyre and Rubber Co. (Great Britain), Ltd., have sent twenty-five guineas. Ten guineas have also been received from the Thames Iron Works, Shipbuilding and Engineering Co., Ltd.

## CORRESPONDENCE

[Letters to the Editor should be addressed to the offices,  
27-33, Charing Cross Road, W.C.]

### THE AGRICULTURAL HALL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR.—As there is again a persistent rumour in circulation that the above Hall is on sale, I am desired by the managing director to request you will be good enough to notify in your columns that this is entirely without foundation.

There are a number of exhibitions with many years to run to complete their present leases, and the continued repetition of this unfounded rumour must tend to be injurious to the exhibitions concerned and to the interests of the company.

It is evident that the repeated circulation of unauthorised information that this Hall is for sale is due to a spirit of antagonism which the company cannot in any way account for, and is at a loss to understand.

As this is a serious matter to all concerned, I must ask you to accept my apology for thus troubling you.—Yours truly,

JOHN JEFFREY.

### SMELL AND SMOKE FROM MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR.—In reply to the letter of "Stupefactus" in the *M.C.J.* of the 2nd inst., it is impossible in practice to use paraffin for lubricating the

A 14-h.p. Star Car fitted with Landaulet body. The wheel base of the vehicle is slightly over 10 ft.

cylinders and crank chambers of motor-cars; the chief reason being that as the cylinders and pistons become warm and attain their normal working temperature the heat is so very great that the paraffin oil would distil, not only in the combustion area, but also on and behind the rings, leaving the moving surfaces dry. If the piston and cylinder walls were kept cool, for example by the circulation of water, to a temperature below the distillation point of the paraffin, I see no reason why such a light oil should not be used for the lubrication of internal combustion engines with high speed and light load. My previous letter was written on the subject of smell and smoke, and the experiment mentioned therein was not meant to justify the use of paraffin as a lubricant.

The subject of the best combination of distillation point and viscosity for internal lubrication has for some time past had the closest attention of our laboratory, and I think the results which we hope shortly to publish will be of interest. At the moment I may say that we are convinced that a great mistake is being made by those using a so-called "heavy" oil. We consider that the only reason for the use of these heavy oils for the lubrication of internal combustion engines is to hide the defects of faulty workmanship, in badly fitting bearings, and badly jointed crank chambers, etc. With these heavy oils the likelihood of carbonisation is increased, and the loss of power, due to the high coefficient of internal friction, is remarkable.—Yours truly,

A. DUCKHAM.

### FOUR v. SIX CYLINDERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR.—A noteworthy addition to the four v. six cylinder controversy has been made by the announcement that the E. R. Thomas Motor Company, of Buffalo, U.S.A., has given up the construction of "sixes." I have just read the news in an American motor journal to hand to-day, and, as the subject is of general interest, I append the cutting in the hope that you will be able to find space for the same.

Mr. Thomas, the head of the concern, on being asked the reason

for this change of front, stated that "we have had a great deal of experience with six-cylinder cars, and at the start were quite enthusiastic over their fine running qualities. But, after a long series of exhaustive tests, we have abandoned the construction of six-cylinder touring cars and are confining our efforts to four-cylinder vehicles, because of the belief that they are far better suited to the requirements of the general public. We admit that six cylinders are flexible. The torque is more constant, and vibration less. The slight advantage, however, is not perceptible, in a car of adequate power, when on the road. The disadvantages of six-cylinders are not only numerous, but, to our way of thinking, very serious, and very far outweigh the slight advantage claimed. It is obvious that six cylinders weigh more than four, and hence the weight is greater on the front axle. The four-cylinder car is easier to steer, is easier on front tyres and is more comfortable, as the car, being lighter in front, will surmount obstacles with less jar and strain. Six cylinders require ten or more inches longitudinal space in front of the dash in excess of that necessary for four cylinders; hence a six-cylinder car requires ten or more inches of increased wheelbase, allowing the same seating room. The longer the wheelbase, the longer and heavier construction is required to withstand the increased road strains. Six cylinders of equal piston area as compared to that of four will develop much less power than the four, owing to fifty per cent. increased friction of the two extra cylinders and cam bearings. The loss in general results is large, owing to the two extra pistons, the weight of the extra pistons and connecting rods working against the compression on the uplift of two extra valves, and the fact that in addition to the loss of power generated great weight is added to the car by reason of longer wheel base and extra parts. Six cylinders require a longer and comparatively heavier crankshaft, and its liability to twist, spring and break is greatly increased. Accordingly more and larger bearings are necessary. The complications and troubles of six cylinders compared with four naturally increase fifty per cent.; but they seem to increase in a greater ratio. The timing of the engine is one of them; then comes the more complicated system of wiring, of lubrication, of cooling, of getting the proper mixture and distribution of the gas from the carburettor. The problem of most manufacturers is to simplify, for the more complications, the great number of wearing parts, the certain eventual increased annoyances and expense, and hence we regard the six-cylinder car more of a fad than practical for the average user of a touring car."—Yours truly,

R. E. ECCLES.

### JUSTICES' JUSTICE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR.—At the Rugby Petty Sessions, on the 29th ult., the chairman (Dr. Clement Dukes), when fining a motor-car driver for exceeding the legal speed limit, told the defendant "that the use of the roads by manufacturers to test cars must be stopped."

Evidently the doctor is a prejudiced man so far as motor-cars are concerned, and as such he is not the right man to be chairman of any legal tribunal; the law should be administered in a perfectly unbiassed manner.

If British manufacturers are not allowed to use British roads for testing their cars, where, in the name of common sense, are they to test them? Motor-cars are used on the roads, therefore they should be tested on the roads; if manufacturers are not permitted to test their cars, who would buy them?

I venture to think that if Dr. Clement Dukes were buying a car he would ask, "Has the car been tested?" If the manufacturer told him "No, the roads were closed to us," the result would be that the doctor would not buy a British car; and, following the argument out further, if British cars are not allowed to be tested on British roads, the public will not buy British cars, British manufacturers will have to shut up their factories, British workmen will be put out of employment, the development of a growing national industry checked if not ruined, and more British gold will go to pay for motor-cars of foreign manufacture. This is the probable result if men like Mr. Dukes are to be permitted to make thoughtless and reckless statements which tend only to further handicap an industry which has already in the past suffered much from legislative restriction.—Yours truly,

J. B. KING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR.—It was recently reported in the papers that at Uttroter the driver of a cart was charged with deliberately placing his vehicle and horse across the road in order to obstruct an approaching motorist, who, to avoid a collision, was obliged to run into a hedge. A gentleman who was riding in the car was thrown out and severely injured. As in cases of this kind the driver of a horse-drawn vehicle is generally discharged with a caution or fined 1s., it is refreshing to observe that in this instance a fine of £1 was imposed for obstruction, and another of £5 for causing an accident. But even this punishment by no means corresponds with that dealt out to motorists charged with offences far less mischievous.

I have been present in court when an automobilist was fined £10 and costs for very slightly exceeding the speed limit on a straight, open country road, it being admitted that no man, woman, child, or animal was within sight, and the evidence depending on the accuracy of a cheap stop-watch; and when, in addition, it was a first offence.

It seems scarcely fair that a purely technical misdemeanour, which might have been committed inadvertently, should be punished by the infliction of a fine almost twice as large as that demanded from a spite-

ful driver, who, by deliberately and of malice aforethought breaking the law, caused severe injury to a gentleman enjoying his indisputable right of using the King's highway.—Yours truly,

W. J. BOSWORTH,  
Colonel.

### RECOVERY OF A CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—No doubt you will be pleased to learn that we have regained possession of the 10-h.p. Darracq car, No. 8910, with long chassis and side-entrance body, which was obtained from us by means of a worthless cheque. We immediately placed the matter in the hands of the detective department at Vine Street Police Station, and we have to thank them for the prompt manner in which they traced the car for us, and for the assistance which they gave us in our efforts to obtain possession of it.

We have also to thank you for the notice which you kindly inserted in your columns on the 2nd inst. respecting our loss, and we trust that you will be good enough to give a similar notice to this letter, in order that the public and trade may know that we have regained possession of this car, and that the warrant is still out for the man who obtained it from us.—Yours truly,

J. KEELE AND CO.

burettor it will not commence to run. We would advise trying to start without flooding the carburettor, and, if this is not a success, the compression tap might be opened and the engine given a few turns until a fair explosion is obtained,—this through the compression tap. Upon closing the latter the engine should start readily.]

### A TROUBLESOME NOISE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—My car has started to make a hammering noise when travelling on the top speed. It sounds as if some projecting piece, such as a nut, hits against some other piece when revolving. The noise does not occur on the first or second speeds, nor on the reverse, nor even when the engine runs with the gear at neutral. I have had the gear-box open and can find nothing wrong. The noise goes on when "coasting" down hill with the clutch out. The gear drives direct on the top speed. If you can render me any assistance in elucidating the cause of the trouble I should be grateful.—Yours truly,

R. R. KINSLEY.

[The noise may be due to the shaft between the clutch and gear-box being worn where same is connected to the gearing, or, in the case of a cardan shaft, the pins of this may have worn slack. Either of these would cause a knocking as described, and would only be heard whilst the car was running on the top speed, because on the lower gears the engine is running at a high speed in comparison with that of the car and

A Motor-Car Smash at Helensburgh.

The above illustration depicts a bad motor smash which occurred at the junction of Glasgow Street and Princes Street, Helensburgh, N.B., on the evening of the 4th inst. Mr. John Watt, a local motor-car agent, informs us that the cars concerned were a 16-2-h.p. Argyll and a 23-h.p. Vinot, belonging to Mr. D. Kirkpatrick and Mr. T. M. McAlpine respectively. The former was proceeding north up Glasgow Street, and the other west along Princes Street. The Argyll car caught the back end of the Vinot, and the force of the impact sent this vehicle spinning round and over on its side, bursting all the road wheels and twisting the back axle. The Argyll fared worse, being toppled right over, and will require a new frame and practically a new body, as the one fitted was telescoped. On board this car were two ladies and a gentleman and the chauffeur; beyond a slight shaking the former were unharmed, but the chauffeur, who was pinned beneath the car, was badly bruised about the head. The Vinot contained only the driver, who was thrown clear and escaped injury.

### STEAM CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Is there any gear arrangement which can be fitted to the pump of a steam-car, so that the slower the engine works, the quicker the delivery of water will be to the generator? For hill-climbing, this assistance would render a steam-car almost perfect.—Yours truly,

A. T.

### TROUBLE WITH DE DION ENGINE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have a 6-h.p. Cupelle with De Dion engine which runs excellently when once it can be induced to start—that is to say, it starts abominably. I have tested the accumulator with a voltmeter, examined the wires for a short circuit, taken down the carburettor and cleaned it out, looked at the plug and contact breaker, and all seems right enough. Flooding the carburettor seems to make no difference. When the motor does start, after about five minutes' tugging at the handle, the engine pulls splendidly. It seems to me rather a mystery, but perhaps you can put me on the right track.—Yours truly,

C R 328.

[Our correspondent's difficulty in starting may be due to the engine getting too rich a mixture, which is sometimes the case, and until the motor is turned round sufficient to suck out most of this from the car-

keeps the slack up to one side. On the top gear the car has a tendency to overrun the engine, therefore the worn part is continually being taken up, first on one side and then on the other.]

### DEVELOPMENT IN MOTOR DESIGN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The existing type of petrol motor, with all its faults on one hand, and all its good features on the other, is only passing through a stage of development; it is impossible to believe that anything like finality has been achieved, or will be achieved, until the enormous heat losses through the cooling water and through the high-pressure exhaust are in some measure prevented; until something more simple than the present ignition systems is evolved; and until the mechanism employed to regulate the aspiration and expulsion of gases—in other words, the valve-operating mechanism—is simplified to the last degree. The turbine driven by the expansion of an ignited mixture of air and petrol vapor seems, at present, to be a practical impossibility, and it is reasonable to believe that for some time to come the petrol motor will develop along the lines of the engines now in use.

No single motor or type of motor has a monopoly of all advantageous features, each possessing its own peculiarities. It may be, and often is the case, that in order to turn out a motor that will embody some

particular feature of merit, the designer incorporates a number of undesirable devices—perhaps more than counterbalancing the benefit to be derived from the meritorious feature. The fact remains, however, that the merit is there, and only needs to be separated and brought to light to improve the motor. There are now three apparently irreconcilable features of petrol motor design that, if successfully combined and refined, would produce a motor having many advantages. These are air-cooling, the two-cycle system of operation and ignition by primary current. A motor in which these features were combined would be free from complications, weight, friction and mechanical losses, constructional expenses, noises and other disadvantages attendant upon the use of valve gearing, pumps, tanks, and extremely delicate and expensive apparatus necessary with high-tension ignition systems. It is obvious that mechanical difficulties of the most serious importance must be overcome before a good motor of this type can be produced; but it is equally obvious that an engine with no valve troubles, no water circulation troubles, and no high-tension current problems, would be almost ideal. It might seem that the production of high-powered motors of this type would be impracticable, owing to the difficulty of air-cooling large cylinders. The mechanical simplicity of the motor would make the use of a greater number of cylinders less objectionable than in four-cycle construction, and this, together with

nowadays of primary importance on a car; but surely, if one is fitted, it should be so installed as to operate accurately and not be subject to the irregular running of a leather belt, the tension of which is affected in so many ways, even by varying conditions of the atmosphere.  
—Yours truly,

R. J. OGDEN.

### KNOCKING IN THE ENGINE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—There is a perceptible hammering taking place somewhere in the engine of my car, but so far I have been unable to locate it. It is not due to the ignition being too far advanced, for it is present when the spark is retarded. I took the advice of a fellow motorist and cleaned out the cylinder with paraffin to loosen the rings in case they were sticking, but the hammering still continues. I shall be glad if you or any reader of the *M.C.J.* can assist me.—Yours truly,

E. R. BERTRAM.

[Mr. Bertram's trouble may be due to many things; a loose bearing may in all probability be the cause, or premature firing may be occasioned by the cylinder heads being foul or carbonised. The only remedy for this is to remove the cylinders and thoroughly clean the

The Meet of the Lincolnshire Club at Scawby Woods. (See page 353.)

the fact that there is a power impulse at every stroke, should more than outweigh any objection on that score.—Yours truly,

R. R. CAUSTON.

### A QUESTION OF LICENCE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have just bought a second motor-car. Both cars 'must' be registered, but is it necessary to take out a licence for the second one, seeing that the two will never be on the road at the same time?—Yours truly,

MEDICO.

[The licence is only intended for the person driving the car, and "Medico" will not require a second document of that description.]

### GOVERNOR POSITION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reading through the description of the Austin car in the *M.C.J.* recently, I noted it was stated that the governor is mounted on the rear end of the radiator fan spindle. As the latter is driven by a belt, and, as far as I can see, no provision is made for keeping the belt taut, the arrangement does not strike me as being a good one, as, from my experience, fan belts do not give by any means a steady positive drive. Of course it may be argued that a governor is not

heads; at the same time it will be possible to see if all bearings are in good condition.]

### EXPLOSIONS IN THE INLET PIPE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be glad if you could assist me in ascertaining the cause of explosions in the inlet pipe, and sometimes in the carburettor. The latter is inclined to flood when the air inlet is half off or closed. If it is bad carburation, how is it ignited in inlet pipe? The car is a four-cylinder one and runs well, but suddenly developed explosions. Both high tension accumulator and low tension magneto ignition are fitted.  
—Yours truly,

T. E. HENDERSON.

[The trouble referred to by our correspondent is usually caused by a leaky inlet valve allowing a portion of the ignited charge to pass back into the inlet pipe. Sometimes too rich a mixture will cause this, especially when the engine is suddenly throttled down. We would advise the grinding in of the inlet valves. Also see that they are well down on their seat; they may be touching the tappets, slightly holding them off the seating.]

PART of a motor-cycle lamp has been picked up near Bampton; owner can have it on sending description to Mr. O. O. Collett, Bampton, Oxon.

## CLUBS AND ASSOCIATIONS.

## KENSINGTON.

SOME thirty members and friends of the Kensington Automobile Club met on the 9th inst. at the "Compleat Angler," Marlow, for tea, among those present being Miss Haywood, Drs. L. C. Dobson, Corbould, and Messrs. Reeves, Haywood, Foster, Dobson, Bidwell, Bridgland, and Wyness Stuart. A few came earlier, possibly with the idea of a turn on the river, but the beauty of the riverside garden was sufficient to keep them on shore. Regret was expressed that, with such perfect weather and surroundings, so many members had been compelled through other engagements not to join the meet. Though but a few weeks old, there are now close on fifty members enrolled and the number increases at each committee meeting.

## AERO.

THE Aero Club's trial trip of the huge balloon, "City of London," 77,000 ft. capacity, took place on Saturday from the Wandsworth Gas Works, the descent being made on the Banstead Downs. The balloon, which is the largest in England, carried nine passengers, including Lord Royston, the Hon. Mrs. Assheton Harford, Miss Heron-Maxwell, Mr. C. F. Pollock, Professor Huntington, the Hon. C. S. Rolls, Mr. Wright, Mr. Spencer (the maker of the balloon) and Mr. Frank H. Butler. The latter has entered the balloon for the Gordon Bennett Aeronautical Cup race from Paris on September 30th.

## KENT.

ON Saturday the Kent Automobile Club held a hill-climb at Pippingford Hill, three miles from Hartfield, near Crowborough. The cars were timed up the hill from a dead start, the length of the run up being exactly a mile. The average gradient is 1 in 11.9, the steepest parts being rather more than 1 in 6.

Mr. W. Willis was the judge, Messrs. S. F. and Cecil Edge acted as timekeepers with Mr. R. Lucas, Mr. Granville Kenyon as starter, while Colonel Edward Latter, Mr. T. H. Nash, and Mr. A. Gurney Preston were the stewards.

The following are the results:—

Class A.—For cars the list price of which does not exceed £200.

This class was cancelled owing to paucity of entries.

Class B.—For cars the chassis price of which does not exceed £400.

W. F. Bolton	...	10-12-h.p. Humber	Winner by 14 2-5 sec.
H. O. Hall	...	14-22-h.p. Germain	2nd by 2 min. 18 3-5 sec.
A. J. McFarland	...	12-h.p. Prunel	3rd.
F. W. Crook	...	10-h.p. De Dion	4th. Did not finish.

CLASS C.—For cars the chassis price of which does not exceed £600.

A. Huntley Walker	...	20-h.p. Darracq	Winner by 47 4-5 sec.
T. H. Nash	...	20-h.p. Darracq	2nd by 1 min. 11 1-5 sec.
W. Symmonds	...	15-h.p. De Dion	3rd by 1-15 sec.
C. B. Gardner	...	15-h.p. Panhard	4th.

CLASS D.—For cars the list price of which exceeds £600.

F. W. Baily	...	50-h.p. Napier	Winner by 40 4-5 sec.
H. Gardner	...	40-h.p. Mercedes	2nd by 8 2-5 sec.
A. Huntley Walker	...	60-h.p. Mercedes	3rd by 4 1-5 sec.
A. Gurney Preston	...	28-32-h.p. Mercedes	4th by 1 min. 32 3-5 sec.
F. Holman	...	22-24-h.p. Martini	5th.

## LADIES'.

ON Wednesday, the 6th inst., the following ladies were elected to membership of the Ladies' Automobile Club:—Mrs. Adair, Mrs. Walter Bailey, Vere, Viscountess Galway, the Countess of Gosford, the Marchioness of Linlithgow, Lady Milbanke, Mrs. Walter Munday, the Countess of Portarlington, Miss Mary Naylor, Mrs. Henry Stocke, Mrs. Pennell Tate, and the Hon. Mrs. Algernon Hanbury-Tracy.

The members of the club have been invited by one of their number, Mrs. R. C. Turnor, to meet on Wednesday, the 27th instant, at Binfield Park, Bracknell, Berks. The shortest route is *via* Brentford, but the best—which is not very much longer—is as follows:—Putney Bridge, Kingston, Hampton, Sunbury, Staines, Egham, Ascot, Bracknell. The distance from Hyde Park Corner is thirty-four miles. Members should look out for police traps between Egham and Ascot.

## LINCOLNSHIRE.

THE members of the Lincolnshire Automobile Club were on Saturday enabled, by the kindness of Mr. R. Sutton-Nelthorpe, J. P., Scawby Hall, to inspect the wonderful breeding grounds of the black-headed gulls at Scawby gull ponds.

Afterwards the members, nearly 150, drove over to Brigg for tea at the Angel Hotel, and a meeting of the committee was held, at which the following gentlemen were elected members of the club:—Mr. Alfred Shuttleworth, J. P., Lincoln; Mr. N. C. Cockburn, Harmston Hall; Mr. Cecil H. Lamb, Gainsboro'; Mr. C. May, J. P., Stamford; and Mr. G. H. Martyn and Mr. G. Moody, Grimsby.

## CHATHAM.

SEVERAL interesting meets are in contemplation by the Chatham and District Motor Club, including a run to Margate on the 23rd inst., to Crayford on the 27th, to Dover on the 15th prox., and Tenderden on the 29th July. It is the intention to add a garage to the headquarters, the Mitre Hotel, Chatham.

## NEW FOREST.

A CLUB for motorists residing in the New Forest and Bournemouth district is now in course of formation, with Mr. Clement J. Haydon, of Westover Chambers, Bournemouth, as hon. sec., *pro tem*. A meeting has been held at the seaside resort, with Col. Roberts Thomson in the chair, and a second gathering will take place on the 23rd inst., at the Balmer Lawn Hotel, Brockenhurst.

## ESSEX COUNTY.

THE Essex Club is holding a gymkhana at Colchester to-day (Saturday), in aid of the funds of the Essex and Colchester Hospital. The Ipswich and East Suffolk Automobile Club have been invited to enter a

The 30-h.p. Daimler which made the fastest time in the Meltham Hill Climb of the Huddersfield Branch of the Yorkshire Automobile Club.

team to compete in the various events. The enclosure is at Sussex Road, Colchester, and has been lent for the occasion by Col. Howard.

## ESSEX.

AN important motor-cycle race meeting will be held at the Canning Town Athletic Grounds, West Ham, on the 14th prox. The events will include a one hour record race limited to 76 by 76 engines; five miles handicap limited to 76 by 76 engines; tourists' handicap race for standard machines, engines not to exceed 90 by 90, and other events, full particulars of which can be obtained from the secretary, Mr. E. G. Reynolds, "Rookstone," Woodford Green.

## IRISH.

THE Irish Automobile Club is organising a pleasant outing, by motor-car, to Glendalough, in September next.

Motorists driving between Naas and Newbridge should drive slowly and with care, as the hounds belonging to the Kildare Hunt are often exercising in the district and have to cross the road at certain points.

## ROAD REPORTS.

BRIGHTON TO ROTTINGDEAN.—A proposal to divert and reconstruct the roadway from Brighton to Rottingdean is before the local authorities. It is to be remade for a length of 1,518 yards with a width of 30 ft. and 6 ft. for roadside waste or for a future widening of the road. The steepest gradient will be one foot in 22.82 feet, and excavations to the extent of 22 ft. will be necessary in some places, while the Ovingdean road will have to be raised 16 ft. above its present level.

CO. MEATH.—The Meath County Council has adopted a resolution of its Roads Committee to the effect that they deem it their duty to bring

home the responsibility for the present condition of the roads in the county to the County Surveyor by deferring his salary for a period.

THE heavy motor-car traffic through Christchurch has raised the dust problem in an acute form, and the Town Council has made more than one attempt to solve it, but without success. The Council has now decided to experiment on a portion of the highway between Barrack Road railway bridge and the borough boundary with a patent dust-laying liquid.

BRENTFORD.—A sub-committee of the Middlesex County Council visited Brentford on Tuesday, to examine the High Street, which the District Council propose to widen by instalments.

### MOTOR-BOAT RELIABILITY TRIALS.

THE Motor Yacht Club will hold its third annual trials for motor vessels, fitted with any form of internal combustion engine, at Southampton, on August 1st and 2nd. The last day for receiving entries at single fees is June 30th, and, although the general scheme of competition remains the same as in previous years, several modifications have been made to the rules. The more important of these may be summarised as follows:—

1. The trials are restricted to vessels propelled by internal combustion engines.
2. Entrants who declare the selling price of their vessels are required to guarantee to supply duplicates at the same price.
3. A more sheltered course than that provided by the lower reaches of Southampton Water will be prepared for use by the river boats in the event of exceptionally rough weather.
4. Vessels entered in the cruiser class will be required to cover the combined sheltered and open courses continuously, instead of running for the greater part of the time over the sheltered course only.
5. A reversing and restarting test has been introduced.
6. The entries will be classified in accordance with the Marine Motor Association regulations.
7. The apportionment of marks has been considerably modified. In particular, "speed" has been allotted 100 marks instead of 50, in order to discourage the running of engines considerably below their normal power with a view to reducing the risk of loss of marks under the head of "reliability." "General condition" has been reduced from 100 to 50; "economy" has been allowed 30 instead of 20; "efficiency of reversing arrangements" will receive 25 marks instead of 10, and an increase has also been made to the marks under the heads of "arrangement," "ease of control" and "silencing." A new head, "starting of engine," has been introduced.
8. On each morning of the trials competitors will be allowed only five minutes, instead of ten minutes, in which to prepare and start their engines. As in previous years, no repairs or adjustments will be permitted at the conclusion of the first day's run.

### SPEEDOMETER PERFORMANCES.

THE award in the recent speedometer trials of the A.C.G.B.I. has already appeared in our columns. From the judges a full report has now been received in which the road record of each instrument is given as follows:—

Cowey indicator, fitted to a 20-h.p. Rolls-Royce, completed a distance of about 2,000 miles without attention and with no repairs.

Cowey recorder, fitted to a 20-h.p. Dennis car, completed a distance of about 2,000 miles. The flexible shaft was broken on the eighth day and replaced; with this exception it ran without attention or repairs.

Elliott motometer, fitted to a 20-h.p. Rolls-Royce, completed a distance of about 2,000 miles. At end of the second day the friction roller was adjusted. With this exception it ran without attention or repair.

Gratz speedometer, fitted to a 28-h.p. Daimler, completed a distance of about 2,000 miles. The bearings were oiled on the third and fourth days; with these exceptions it ran without attention or repair.

Jones speedometer, fitted to a 28-h.p. Daimler, completed a distance of about 2,000 miles without attention and with no repair.

Kirby speedometer, fitted to a 28-h.p. Daimler, completed a distance of about 2,000 miles. On the second the bracket was readjusted, also friction pulley adjusted and tested; on the fifth day the friction wheel bearing was oiled; on the seventh day the flexible shaft broke and was replaced; with these exceptions it ran without attention or repairs.

Staunton speedometer, fitted to a 20-h.p. Dennis, completed a distance of about 2,000 miles. On the fourth and sixth days the bearings of the spur wheel were oiled, and on the tenth day the flexible shaft broke and was replaced; on the eleventh day the instrument ran badly, owing to faulty adjustment of new flexible shaft. During the rest of the trial it ran without attention or repairs.

Vulcan speedometer, fitted to a 20-h.p. Dennis, completed a distance of about 2,000 miles. On the first day the bracket on the front axle had to be removed, a new one being fitted on the second day. It ran during the rest of the trial without attention or repairs.

Warner speedometer, fitted to a 20-h.p. Dennis, completed a distance of about 2,000 miles. On the third day the driving shaft was adjusted;

on the fifth day the flexible shaft broke and was replaced. It ran during the rest of the trial without attention or repairs.

### THE LAND'S END—JOHN O' GROAT'S MOTOR-CYCLE TRIAL.

THE trial of motor-cycles from Land's End to John o' Groat's, a distance of 889 miles, organised by the Auto-Cycle Club, attracted no less than ninety-three entrants, representing all known makes of machines. Of these, sixty-nine are bicycles, twenty-one tri-cars, two side-cars, and one quad-car. The trial commenced on Monday last at Land's End, and competitors are due at John o' Groat's to-day (Saturday), at 3.30 p.m. The event is essentially a reliability trial, any competitor exceeding a speed of twenty miles per hour being subject to disqualification. The competitors were early astir, and rarely, if ever, before has the road between Penzance and Land's End been so crowded with traffic. Out of the ninety-three entries, seventy-five—fifty-nine motor-bicycles, fifteen tri-cars and a quad-car—faced the starter. The first batch of riders were sent off at 8 a.m. on the day's journey of 152½ miles to Taunton. Within twenty minutes all the competitors were on their way with the exception of Miss Muriel Hind, the only lady in the competition, who was considerably delayed owing to the rear wheel of her 9-h.p. Singer sustaining a puncture. In the motor-bicycle class forty-four riders reached Taunton within schedule time, as also did the quad-car, and eleven of the tri-cars.

Warrington, 199½ miles, was the destination on Tuesday, while on Wednesday the run was to Lockerbie, 142½ miles; on Thursday to Pitlochry, 149½ miles; on Friday to Tain, 134 miles, and to-day (Saturday) to John o' Groat's, 110½ miles.

### THE SOUTH HARTING HILL-CLIMB.

THE following routes to South Harting will be of interest to those attending the A.C.G.B.I.'s hill climb there on the 23rd inst.

From London.—The Portsmouth road should be followed from Hindhead, and past Liphook and Rake. About one mile after Rake, and about three miles before Petersfield, turn sharp to the left at the "Jolly Drover." Next turn to the right, and down hill to Rogate village. Straight across at the village, past Rogate Station, and three-quarters of a mile farther on take right-hand fork at signpost. Distance from Liphook, nine miles.

From Petersfield.—For those who fear losing their way, the Portsmouth road may be followed to Petersfield, from which there is a road which cannot be missed to South Harting. Distance, three and three-quarter miles.

From Chichester.—Follow the Midhurst road through Lavant, and about a mile further on take left-hand fork at signpost marked Chilgrove. Follow this road across Chilgrove Green, and up Chilgrove Hill, at the top of which right fork. Pass Hill-lands Farm and North Marden Farm, and follow the only road there is, which leads to the top of South Harting Hill. Distance from Chichester, eleven miles.

From Midhurst.—Follow the Midhurst to Petersfield road as far as Stedham Common, where turn left for Elsted Station. Proceed to Elsted Village, where turn right and pass under Beacon Hill to South Harting. Distance from Midhurst, eight miles.

### MOTOR-CYCLE ELIMINATING CONTEST.

IN the selection of the British team for the International motor-cycle race there were five competitors. The contest took place at Knowsley Park, in Liverpool, on the 8th inst. Of the five entrants R. Morewood (6-h.p. Westlake) retired early in the race through the steering column of his machine breaking, and A. Butt (riding for T. Silver on a 4-h.p. Quadrant, the only single-cylinder machine in the contest) was put out of the competition with exhaust-valve trouble.

The circuit was four miles and a half in extent, and had to be covered twenty-seven times, making a total distance of 121½ miles. In each lap eight awkward corners had to be negotiated. The winner's average speed of 41½ miles an hour, therefore, was remarkably good.

The result was as follows:—C. R. Collier (7-h.p. Matchless), 2 h. 56 min. 26.25 sec.; H. A. Collier (7-h.p. Matchless), 3 h. 21 min. 48.45 sec.; C. B. Franklin (6-h.p. Jap), 3 h. 20 min. 54 sec. for twenty-four laps.

Subsequently speed trials were held over the mile flat, the best effort being H. Collier's 1 min. 4.25 sec. The team to represent the United Kingdom in Austria is C. R. Collier (7-h.p. Matchless), H. A. Collier (7-h.p. Matchless), and C. B. Franklin (6-h.p. Jap).

### MOTOR-BOAT REGATTA.

A two days' international motor-boat regatta was concluded on the Mersey on Saturday. Chief importance attached to the contest for the British Motor Club's flying mile cup. There were only two competitors, the *Rose-en-Soleil*, owned by Lord Howard de Walden, and *Hutton II.*, belonging to Mr. J. E. Hutton. Unfortunately, the latter had sustained a mishap earlier in the day, and was unable to start. *Rose-en-Soleil* went over the course in the remarkably quick time of

2 min. 12 sec., which is believed to be a record for a steam motor. The race for motor-boats not exceeding 40 ft., over twenty miles, was also won by Rose-en-Soleil, in 47 min. 31 sec. A handicap for boats not exceeding 30 ft., distance sixteen knots, went to Takumono, whose time was 1 h. 15 min. 7 sec. Napier Major won the handicap for cruisers, distance sixteen knots, in 1 h. 57 min.; Iris a handicap for motor-boats not exceeding 18 ft. over all, distance eight knots, in 2 h. 7 min. 32 sec.; and Pop a handicap for dinghies not exceeding 16 ft., distance four miles, in 1 h. 36 min. 55 sec.

#### NEW COMPANIES REGISTERED.

**MOTOR HOUSE, LTD.**—Capital, £100. To carry on in the United Kingdom or elsewhere the business of manufacturers of and dealers in motor-cars, cycles and other vehicles, and garage proprietors. Registered office, Broad Street House, E.C.

**HAMPSHIRE MOTOR 'BUS COMPANY, LTD.**—Capital, £20,000. To acquire the business of the Aldershot and Farnborough Motor and Cycle Works, together with the premises where the said business is carried on.

**WARRINGTON MOTOR CARRIAGE COMPANY, LTD.**—Capital, £5,000. To carry on the business of manufacturers and repairers of, dealers in and agents for the sale of motor and other vehicles and accessories for the same, etc., and to adopt an agreement with Messrs. C. Roger, F. R. Holding and T. M. Broadbent.

**GARELOCH MOTOR SERVICE COMPANY, LTD.**—Capital, £5,000. To carry on the business of proprietors of motor-omnibuses, motor-cabs, etc. Registered office, 1, West Clyde Street, Helensburgh.

**NORTH BRITISH MOTOR MANUFACTURING COMPANY, LTD.**—Capital, £20,000. To purchase the business of the Dumfries Brass and Iron Foundry Company and to carry on the business of founders, dealers in automobiles, motor-cycles, etc.

**MOTOR TOURING COMPANY, LTD.**—Capital, £30,000. To carry on the business of manufacturers of and dealers in motor-cars, omnibuses, cycles, and other vehicles, and tyres for the same, etc., and to adopt an agreement with the International Trading Company, Ltd., 20, Copthall Avenue, E.C.

**AUTOMOBILES, LTD.**—Capital, £100. To carry on the business of manufacturers of and dealers in motors and other vehicles of all kinds, etc. Registered office, 5, Great Marlborough Street, W.

**FRENCH MOTOR ACCESSORIES COMPANY, LTD.**—Capital, £1,000. To carry on the business of agents for and dealers in motor accessories, motor vehicles, &c.

**BRITISH AND FRENCH MOTORS, LTD.**—Capital £20,000. To take over (1) the business of a motor and general engineer carried on by Mr. F. W. Jenkins in London and elsewhere, and (2) the undertaking of Kimberley Bearings, Ltd., and to adopt agreements with Messrs. F. W. Jenkins, "Kimberley Bearings, Ltd.," and N. G. Kimberley.

#### PUBLIC MOTOR SERVICES.

THE managers of the West Elers Estate motor-'buses service have arranged to run their motor-'buses from Ealing Broadway, via West Elers estate and Lammas Park, to Kew Gardens and back.

A SPECIAL meeting of the Yeadon (Yorks) District Council has resolved to convene a meeting of the ratepayers to obtain their sanction to a scheme for establishing a local motor-'bus service. A four days' experimental service was recently run, the cost being £29 and the receipts £23.

OWING to complaints of dust being raised by the motor-'buses plying in the Western Road, Brighton, the Watch Committee has decided that it be a condition of the licences issued by the Town Council for motor-'buses to ply for hire within the borough that the speed of such 'buses shall not exceed ten miles an hour.

THE Ramsgate Corporation have sanctioned the establishment of a service of motor-cars to run between the borough and the country districts.

ON Monday next the G.E.R. Company will commence a service of motor-omnibuses for the conveyance of passengers and parcels between Colchester station and West Mersea.

#### A TRIO OF DISMISSALS AT ST. AUSTELL.

AT the St. Austell Sessions three interesting cases have been heard against motorists. The Rev. George St. John Topham, Compton Martin Rectory, Bristol, was charged with driving his motor-car through Sticker village on May 7th at a speed dangerous to the public.—Defendant pleaded not guilty.—P.C. Osborne, stationed at Sticker, stated that he was standing in his garden when he saw a motor-car—marked Y 313—travelling at a very fast rate. He stepped down to his garden gate, held up his hand, and shouted. There were two occupants of the car, and when he shouted one smiled at the other and they passed on without taking any notice of him. They continued at a high rate on towards St. Austell until they were out of view. There were about twenty children at the side of the road; if they had been in the centre they would not have had time to get out of the way. The motor was travelling at a terrific rate, more like a train. Evidence was given, and after considering the case the Chairman said a majority of the Bench were willing to give the defendant the

benefit of the doubt and therefore dismissed the case. The decision of the Bench was received with applause, which was instantly suppressed.

WALTER HICKS, jun., St. Austell, pleaded not guilty to riding his motor-cycle on April 24th at a speed dangerous to the public, and Frank Stocker, a local farmer, gave a similar reply to a charge of furious driving. Both cases were dismissed.

#### A NOISY MOTOR-'BUS.

EDWARD FLOWERS, of Carlton Road, Kentish Town, N.W., has been summoned for not using all possible means to prevent the machinery of his motor making a noise when at a standstill. In consequence of complaints from inhabitants of Tufnell Park the police took action. Mr. Barker, who appeared for the Commissioner, called expert evidence to show that the noise of this particular motor could be considerably modified and altogether stopped if all the appliances were used. The defendant said it was a stubborn motor, and needed more than ordinary trouble to set it going when once it was stopped. But he had throttled it down and minimised the noise. The inspector from the Public Carriage Department said the motor in question could be started in 15 sec. after being absolutely stopped; and when the machinery was in motion the noise could be minimised to the extent to which the machinery for the purpose was applied.

Mr. Bros held that the defendant had not done all that was possible to prevent his motor making a noise. People had complained, and drivers should know that the public must not be annoyed. He would be fined 40s. and 2s. costs.

The above illustration depicts one of the 'buses Messrs. Moss and Woodd are supplying to the Cambrian Railways. The vehicle, which is fitted with a two-cylinder horizontal engine, has accommodation for twenty-two passengers, twelve in main compartment, eight in the smoking section and two by the driver, with luggage on top. It is chain driven throughout, can attain a speed of twelve miles per hour and take gradients up to 1 in 8 with full load. Messrs. Moss and Woodd inform us that the order from the Cambrian Railways was secured at the recent Cordingley Exhibition at the Agricultural Hall.

#### PLACING NAILS ON THE ROAD.

WILLIAM AUSTIN, labourer, of Cippenham, near Slough, who a few months ago was acquitted of a charge of placing a wire trap across the Great Bath Road, near Maidenhead, to catch motorists, was summoned at Beaconsfield on Monday for placing nails on the same road. Two plain clothes policemen were cycling, when they came across accused placing slate nails on the road in tracks of motor-wheels. The officers also found two nails placed upright in the road and surrounded by sand. When accused saw the officers he decamped, but was caught, and on being searched similar nails to those found in the road were discovered in his possession. Colonel Phipps, in fining defendant £2 and 9s. 6d. costs or a month's imprisonment, regretted that the magistrates could not deal more severely with him.

#### ASSAULTING A MOTORIST.

MR. ROBERT LEONARD POWELL, an independent gentleman, residing at Chislehurst, was summoned at Bromley Petty Sessions, Kent, on Monday, for assaulting Lord Royston. The latter stated that he was riding in his car near Bromley, and met Mr. Powell coming the opposite way driving a coach and four. As the coach passed Mr. Powell struck the witness across the head and face with his whip, and then drove on. The witness went after him, and asked for his name and address, saying he had been assaulted. The defendant said, "Yes, and I will do it again." Mr. Powell stated that Lord Royston's chauffeur did not allow him sufficient room, and he struck at the

chauffeur, but hit Lord Royston instead. The Bench imposed a fine of 40s. and costs.

### POLICE TRAPS.

THE police are in the habit of timing motor-cars going through the Great Park at Windsor.

RICHMOND PARK is still the scene of a police trap, in which several motorists have lately been caught.

THERE is a police trap between the Locking Road tramway terminus at Weston-super-Mare and Worle, a village a mile or so further inland. This is the road used by motorists when journeying from Bristol to Weston-super-Mare.

THERE is a trap on the Epping New Road, at Woodford, in which several motorists have lately been caught.

A POLICE TRAP at Gatton has resulted in a good haul of motorists before the Reigate County Bench.

THERE is a police trap between Hull and Beverley.

THE police are still very active at Buckden, Hunts.; they have a measured quarter of a mile which starts about 200 yards before entering the village. On the left hand side, coming from the north, two policemen stand behind a square black board. Motorists, if stopped, should take particular notice what distance they pull up in after they are signalled to, as the police appear to be very inaccurate on the point.

A POLICE trap is being set on Sundays on the Ryslip-Eastcote road, Middlesex; the distance between both places is one mile.

### MOTOR-CAR ACCIDENTS.

THE death occurred at Dorking Hospital, during Wednesday night of last week, of Mr. John E. Bloomfield, Tottenham, who met with an accident while riding a motor-cycle on the previous Sunday morning. Deceased was a member of the Tottenham Cycling and Motor Club, which organised a run to Littlehampton for Whitsun. Mr. Bloomfield started on the journey by himself, expecting to overtake his fellow club members, but it appeared that near Dorking he was descending a dangerous hill, when he lost control of the machine, and fell, sustaining a severe injury to his leg, which was afterwards amputated. Blood poisoning supervened, with fatal results.

TRAVELLING from Bournemouth to Sandhurst, in Kent, on a recent Saturday, Mr. and Mrs. Robert Catt, of Bournemouth, had arrived within a mile of their destination when, on going down Bodiam Church Hill, the car had a skid on a greasy patch of road, the passengers were thrown out and the car somewhat damaged. Mr. Catt escaped with slight bruises, but Mrs. Catt was much more severely bruised and shaken and is still unable to get about. She is, however, making satisfactory progress. At the point where the car skidded many trap and cycle mishaps have happened, as the road is generally in a wet condition.

A BAD motor-smash occurred near Chichester on Saturday. It happened at the cross-roads at Woodcote Farm. Two ladies, belonging to Fishbourne, were driving in a trap, when a 16-h.p. motor-car came into collision. One of the wheels of the trap was almost torn away, but it did not come off, and the ladies escaped. The motor-car was extensively damaged. After performing the feat of mounting an almost perpendicular bank about four feet high, it landed in a field some fifteen yards further on. One of the front wheels was completely taken off, the other nearly so, the axle was broken, and the body of the car was smashed to pieces, practically nothing being left intact except the seats. Assistance was secured, and Mr. M. F. Mievile, of Summersdale, superintended its removal to a trolley, its transit to the West Sussex Motor Works at Chichester being, not unnaturally, the subject for much curiosity on the part of those who witnessed it.

### CASES AGAINST MOTORISTS.

AT Nailsworth, near Stroud, Frederick Heyl, a motor-car driver, of Stroud, was fined £5, including costs, for driving at an excessive speed on May 28th. Defendant drove down a hill at a high rate, the car was overturned on a level road and considerably damaged, and defendant and two other occupants were taken to the hospital.

WILLIAM FARQUHARSON BARCLAY, of Leytonstone, was fined £20 and costs, at Brentwood, last week, for driving a motor-car to the danger of the public down Brook Street Hill, South Weald, on May 19th. Late at night he drove down the hill on the wrong side of the road, and dashed into two horses drawing a hay wagon. Both horses were injured, the wagoner was thrown out, and the car was considerably damaged. Defendant said the horses walked into the motor and caused the collision.

AT Windsor, two cases of furious driving have resulted in the motorists being fined. On the licence of one of them being handed up the chief constable asked the Bench to note that there was no room on it for further endorsement.

A. S. MORRIS, of Tunbridge Wells, was summoned at Hove for recklessly driving a motor-car on Shoreham Road, having regard to all the circumstances of the case, on the 24th May. He pleaded not guilty. William Wisden, of Southwick, said he was cycling on the Lower Shoreham Road in the direction of Brighton. Approaching Sackville Gardens he noticed the motor-car proceeding towards Portslade. The car, which was on the wrong side of the road, knocked him over, injuring him and wrecking his machine. Wilfred Garner gave evidence to

the effect that there was only 42 feet of available road where the accident happened, and the motor-car was on the wrong side. Defendant applied the brake a few yards before arriving at the spot where the accident happened. The Bench fined defendant £5 and 13s. 6d. costs.

SEVERAL summonses against motorists were heard at the Uckfield Petty Sessions on Thursday of last week, including one against Mr. U. Stratton, who was summoned for driving a motor-car at a speed dangerous to the public at Framfield, on the Eastbourne road, and also for not causing his car to stop and remain stationary upon a signal from a constable. Defendant pleaded not guilty, and was represented by Earl Russell. P.S. Waghorn deposed that on May 12th defendant, driving in the direction of Bexhill, covered the measured furlong in eleven seconds, which was at the rate of forty miles seven furlongs an hour. An additional forty feet were allowed for each furlong. The electric timing machine was placed in the centre of two furlongs, and was under witness's charge and in perfect working order. After the car had passed the furlong witness sent a warning along the cable to P.C. Rummery, further down the road, the latter having with him P.C. Rawson. The furlongs in question were along a straight road, but there were several openings and houses along the route. P.S. Huntley and P.C. Rummery also gave evidence. The latter, concealed behind a hedge, gave the customary signal—the waving of a newspaper—to P.C. Rawson to run into the road to stop the car. He saw P.C. Rawson run in front of the car and put up both hands, but the car was not stopped. Defendant, giving evidence on oath, said he frequently travelled between Bexhill and London. He remembered the "trap" near the Barley Mow, and watched his speed indicator carefully; it did not record more than twenty miles per hour. He noticed a constable along the road picking up a helmet after the car had passed, but he was certain no one called upon them to stop. Passing the Barley Mow he had pointed to the trap, with which he was familiar. Addressing the Bench for the defence, Earl Russell held that upon the evidence the allegations of the police were inconsistent and impossible. The Bench considered the first summons—that of driving at a speed dangerous to the public—was proved, and imposed a penalty of £10 and costs. The other summons was dismissed.

It is a very rare occurrence in Co. Kildare to find a motorist "tripped up" by a member of the R.I.C., but Constable O'Brien succeeded in getting a conviction on two grounds against Mr. W. Rafferty, who was driving a motor-car belonging to Mr. Parkinson, of the Curragh. One charge was for not having a proper means of identification by number on the front of the car, and the other against the driver for not having produced his licence. In each case a fine of 5s. and costs was imposed, and the licence was endorsed.

THE Reigate County Bench were engaged some time on Saturday in investigating charges made by the police against eighteen motorists who had been summoned for exceeding the speed-limit. Fines were inflicted in each case ranging from £2 to £6 and costs, and, as the result of the monthly haul, over £60 was added to the county exchequer.

GRACE LILIAN OVERTON, of Friar's Gate, Sutton, was summoned, at Croydon, for driving a motor-car at a speed that was dangerous to the public in London Road, Morden, on the 17th ult. Frederick Halson said he was riding a bicycle along London Road when a motor-car crashed into the back of his cycle. He was taken to the hospital, and did not regain consciousness until the next day. No horn was sounded. By Mr. Keeble: He was making a claim against the defendant, who was the driver of the motor-car. Miss Poupart, of Morden, said she too was knocked down by the motor-car, which, she thought, was going at forty miles an hour. Defendant, giving evidence, said the car belonged to her brother. The speed was about fifteen miles an hour. The chairman said the magistrates were not unanimous. The majority wished to dismiss the case, the charge not having been proved, and the defendant would have the benefit of the doubt.

WILLIAM PERRINS, of Manchester, was summoned, at Carlisle, for exceeding the speed limit. Evidence was given by several constables that defendant was travelling at thirty-five miles an hour at Carleton. They timed him from a certain projecting telegraph pole. Mr. Rowland, of Accrington, who defended, cross-examined one of the constables as to the possibility of identifying the particular telegraph pole at a distance of 988 yards, remarking that, according to an optician's chart, a motor-car at that distance would only look half-an-inch square. He proceeded to test the constable's eyesight with a diagram and apparatus. Superintendent Graham objected to this procedure, and Dr. Barnes, the chairman, said the constable's eye could be tested in a reasonable way. Mr. Rowland said the police were not trained to time people. They were given a stop-watch to play with. Carleton was well known to all motorists, the place being a blot on the motor-map of Cumberland. Allan R. Fenn stated that he was in the car with defendant, and he swore they were not exceeding the speed limit. The Bench ultimately fined defendant 40s. and costs.

VICTOR PAUL SPECK, of Herne Hill, surrendered to his bail on Monday at the Lambeth police court, and was charged on remand with the manslaughter of Amelia Biggs, by driving a motor-car over her at Peckham Road, on the afternoon of Sunday, the 3rd inst. Since the case was last before the Court the circumstances of the occurrence have been inquired into by a coroner's jury, who returned a verdict of "Accidental death." Sub-divisional Inspector Shervington stated that in consequence of the verdict of the coroner's jury the Commissioner had directed him, subject to the approval of the Court, to offer no further evidence. The magistrate thereupon ordered the prisoner to be discharged.

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

## COMMENTS.

ON Tuesday the Automobile Association held a most successful annual meeting in London, under the presidency of Colonel W. J. Bosworth. The chairman mentioned that news of the Association's latest victory reached him as he entered the room. One of their scouts had been prosecuted for obstruction and for not ringing his bell. The scout was defended, and judgment was given against the police, with costs. The present membership was nearly 1,000, and the bank balance equally satisfactory. At the committee meeting earlier in the day 114 new members had been elected, and there had been a great influx of strength since the meeting at the Agricultural Hall Exhibition in March last. All the officers were re-elected, and every speaker was able to testify to the growing efficiency and influence of this unique automobile organisation. It has done much to make the lives of motorists tolerable in the southern counties.

### The Maintenance of Roads.

THE fact that resolutions deploring the alleged injurious effect of motor traffic upon the highways were forwarded to the annual meeting of the Scottish County Councils' Association in Edinburgh last week seems to have inflamed some of the leading journals of the north to declare the unpopularity of the motor-car in the northern portion of this island. Those of us who were received with a floral welcome from the maidens and matrons of Scotland during the Trial, and who were constantly occupied in doffing our caps in response to the salute of laird and labourer alike, can hardly reconcile such a view with the actual facts of the case. Nothing could have been more hearty than the greeting of the Scottish people to the motorists, and although officialdom has been unduly free with the placing of white circles and red triangles upon the roads, its severity was assuaged by the courtesy and tactfulness of the police, who, if not always urging the drivers to greater speed, as they did during the Irish Motor Fortnight of 1903, at least were dourly encouraging and genially showed the way.

### All to bear the Burden.

WE do not take exception to the proposals of the county councils concerned; they are well couched in the public interest. But we do complain of the misrepresentation of the popular view by journals in a position to know the actual state of opinion. Both the Councils of Midlothian and Peebles would devote the proceeds of the present motor-car taxation to the maintenance of the public roads; the Berwick County believes that the national exchequer might well be invited to bear a greater share of this heavy burden that now falls so inequitably upon all districts alike. With these notions motorists generally will be found in agreement. It would be manifestly unfair, for instance, that the people of Tomintoul should be called upon to bear all the cost of bringing the roads

round about to a condition of civilised repair; but the whole of the taxation raised from Scottish motorists could well be utilised in improving such roads and scores of others that might be named, to the general welfare of all. And what is true of North Britain is equally true of more southern latitudes.

### The Motor Cab.

It is anticipated that great development with regard to motor-cabs may be expected in London when the present House of Commons Committee on Street Traffic has concluded its sittings. The authorities at Scotland Yard are of opinion that no motor-cab can be regarded as satisfactory which cannot be turned in a circle of twenty-five feet diameter, a limit made necessary by the narrow streets in some of the busiest parts of the City. With the motor-cab the taximeter seems closely associated in the public mind, and it is not re-assuring to learn from Mr. Basson, the chief inspector of the carriage department of the Metropolitan Police, that by putting a wheel out of order the instrument can be easily accelerated to register twice the distance actually travelled. Judging by the general professional ways of the London cabby, he would not be long in learning such an art; hence the good fortune that awaits the inventor of a taximeter above suspicion.

### Ceylon.

NEW bye-laws with regard to the registration of motor-cars are now in operation in Ceylon, and in order to facilitate matters the Government agent sent to Mr. Harold North, the hon sec. of the local Automobile Club, one hundred and fifty forms of application for registration of motor-cars or cycles, and for licence to drive, with the request that one should be sent to each member of the organisation in the Central Province. From this fact we conclude that the motorists of Ceylon are becoming a numerous body. The registration fee for motor-cars has been fixed at 13s. 4d., and for a motor-cycle at 4s., the latter also being the charge for the licence to drive. Provisions have been made for identification marks being fixed on cars, and the way in which the local authorities are working sympathetically with the Automobile Club is augury of a good feeling being maintained in the motoring community of Ceylon.

### Blackpool Again.

REALLY the Chief Constable of Blackpool seems strangely disposed towards the local motor firms. Recently we remarked upon his attitude with regard to a garage proprietor who had occasion to pass his motor-cars across the pavement into his premises. Now attention may be called to the case of another local firm which, about two years ago, applied for a licence to store petrol in one of their places. The police suggested that the licence should be granted to one of their places about five minutes' walk from the Promenade, and that they should keep as little as possible in their shop in that populous thoroughfare. They advised that sufficient for immediate use should be carried from one place to the other—an

arrangement which has gone on some time. Naturally in the case of a firm letting motor-cars on hire this arrangement has been exceedingly inconvenient. However, it has come to an end by the issue of summonses (1) for keeping petrol without a licence and (2) for contravening the regulations. We would like to see the authorities at Blackpool go into the whole matter of the local motor trade, and assure themselves that it is being conducted without being unnecessarily harassed.

#### Motor-Cars at the Races.

As at the Derby and Oaks automobiles were prominent at the Ascot Races during the past week, and many of those who went thither journeyed by the shorter route *via* Hounslow, Bedfont, Staines, Egham, and Virginia Water, turning right just beyond the Wheatsheaf Hotel, and thence through Sunninghill to Ascot, following the main Reading and Wokingham road. This route took the motorist direct to the back of the grand stand. Another way which was popular led the motorist to Hounslow as in the other, but, turning right there, he had to follow the main Bath road to the cross roads two miles beyond Colnbrook. There, turning left, he went through Datchet and Windsor, and thence, *via* Queen Anne's Gate, through Windsor Park to Ascot, arriving there on the north or Windsor side of the course.

Mr. A. Campbell Swinton at the wheel of his new 40-h.p. Crossley.

#### M.P.'s and the Motor-Bus.

THE motor-bus has now become a recognised section of the automobile world, and under the heading of "Public Motor Services" we are regularly chronicling leading developments in that direction, while the summary of legal and police court cases in which these vehicles figure is acknowledgment of the growing importance of the motor-bus to a large section of our readers—and, having regard to a new classification of the small advertisements this week, our advertisers as well. The subject of motor-buses also constantly occurs in Parliamentary reports, and Mr. Money, the representative of a Metropolitan constituency, has been setting a serious question to the Home Secretary, with a view of emphasizing the liability of break-downs of the machinery and the falling-out of masters and men as to conditions of employment. All these matters are necessarily incidental to the new industry, and we would remind the M.P. for North Paddington that the science of statistics—with which he has claims to be identified—is not yet perfect or conclusive. When the motor-

bus has received as much attention it will be able to carry figures and persons anywhere with safety and surety.

#### Municipal Motorism.

MANY municipal and other local authorities are now the possessors of cars, and will have to seriously undertake the organisation of a special department with a view to securing efficiency and economy. It is said that the Manchester Corporation contemplates inscribing all its automobiles with the name of the particular departments to which they are allocated, thus minimising the opportunities of officials using them on private business—if they would ever dream of such a pleasure. Now the Corporation of Glasgow is about to erect a special garage and to purchase seven vehicles for the use of those engaged in the public work of the city. It is calculated the initial cost will be £4,430, and the annual expenditure is probably over-estimated at £1 per day. But the saving of time, with its consequent facilitation of the municipal business, should be a matter of great appreciation by the ratepayers.

#### Canadian Progress.

It is calculated that at the present time there are about 300 motor-cars in use in Montreal, where Mr. A. H. Dandurand is recognised as one of the pioneer motorists of the Dominion. More than half of these were purchased last year. The Automobile Club of Canada was formed three years ago with the improvement of the roads as one of its chief objects. Mr. A. J. Dawes is the president, and plans are now being matured so that the organisation shall have a club-house in the suburbs of the city. It has decided to use its surplus funds in giving prizes to landowners in the country districts for the best kept section of public road. At present the rate of speed allowed is of a very moderate character—only six miles per hour in Montreal, and fifteen miles in any other town in the province of Quebec. In turning corners no speed beyond four miles an hour is regarded as legal.

#### Oratorical Extravagance.

THE rural councillors of Northwich have an extravagance of utterance wholly superior to their supply of intelligence and common sense. When the Motor Car Commission has concluded its sitting and is considering its report seems to these wisecracks the belated time suitable for scaring the Commissioners into some restrictive suggestions. And so one of the members has just been gravely telling his fellow-councillors that it is their duty to stop "the slaughter of human life" that now goes on by motor-cars. "Talk of war, of epidemics, and the death rate from fevers," declares this important person, "why it is not in it with motor-car fatalities." In the council there seems to have been another councillor of his own manner of speech, and in seconding the resolution that they should call the attention of the Commission to automobile fatalities, he described the cars as the "gods of Juggernaut, whirling through the dust, deprived of the beauties of God's Nature and pure atmosphere." Alas, poor Northwich.

#### Up-to-date.

NOT far from the office of the *M.C.J.*—in the Strand to wit—there is a journal called the "Family Doctor," which in its issue of June 16th contained the following paragraph:—"Mr. Clifford Earp, the English automobilist, has established at Ormonde Beach, according to a New York correspondent, a new world's record in his English-built car. He covered 100 miles in 1 hr. 15 min. 40 2-5 sec." Probably the news was of interest to those who consult the "Family Doctor." The antiquity of the information can only be explained by the desire of the physician not to upset the nerves of slow-moving patients. The

partiality of the medical profession for the automobile is well known; it is fortunate that they do not take their news from this particular journal of the Strand.

**"The Motor Throat."**

MEDICAL men, who recognise that motoring is a great competitor with their physic in reviving the nerves of jaded business men and restoring the health of the "run down" section of the community, seem also determined to charge it with having other attributes of a less healthy order. Recently we referred to some of the conclusions of medical officers of health with regard to the nerve-destruction incidental to wild careering through the country air; now Dr. Williams, of Flint, has been alarming his colleagues of the Flintshire County Council with stories of inflamed throats and swollen eyelids among the village children. He declares that rural life will become unbearable if people keep their doors and windows open. We remember

suggested that it was really a "test," whereupon P.c. Andrews improved upon the suggestion when giving evidence, and said he was at the other end of the "control." Judging by the results that generally followed the operation of such devices, they might be inscribed with the famous phrase, "All hope abandon ye who enter here."

**Public Service.**

A SUNNY trip to Brighton and back from London was enjoyed on Monday by a number of gentlemen interested in the development of motor traffic in the public interest. It will be remembered that among the novelties at the Agricultural Hall exhibition was a motor char-a-banc built by the Thames Engineering Works for the London and South Coast Motor Service, Ltd. This is now to be put in regular service and from the success of the initial run the other day the venture should prove popular and profitable. Trips to Brighton,

Photo by]

The Scottish Trial. The Start of the Trinafour Hill Climb. (See page 330.)

[Argent Archer.

that a doctor in another part of the country has said that people breathe in the dust and its resident microbes while asleep. But surely there is work for the medical man as well as the motorist, and the former should impress upon the people the necessity of sleeping with mouths closed and eyes shut, thus preventing the ingress of the contaminations raised by the progress of modern invention over badly-constructed road surfaces.

**"Technical Terms."**

POLICE phraseology has undergone a change these last few years, and many new words have been added to the vocabulary of Robert. In a case at Highgate Police Court Sergeant Bailey has been enlightening the public as to some of the terms used by mere constables. Asked at which end of the "trap" he was located, he promptly replied, "at the winning post." One of the magistrates expressed disapproval of the word "trap," and

Folkestone and Southampton are being arranged and a time table will shortly be issued.

OWING to the pressure on our space consequent on the many events that have to be chronicled this week, several of our regular features have had to be omitted or curtailed.

MESSRS. BENSLEY AND DEDMAN have opened a large shop with extensive garage in the rear at 720, Holloway Road, N.

THE Idon Motor-Car Co., Ltd., are selling their premises at Parkside, Coventry (about 5,000 sq. yards), goodwill and machinery, by auction on the 28th inst.

MR. JOHN HARGRAVES, of Temple Combe, Somerset, who is well-known in automobile circles as a keen motorist, has just placed an order with the London and Parisian Motor Company, Limited, for his third Hotchkiss. His first car was a 25-h.p., and then at the recent Agricultural Hall Show he bought a 45-h.p. six-cylinder car of the same make. The latest addition to the trio is a 30-h.p.

## The Scottish Trial.

A WAY in the hills of Scotland a rough mountainous pass between Glen Kinglas and Glen Croe seems to ascend in lofty emulation of the towering majesty of Ben Ime, who frowns from a height of 3,300 feet upon the rivulets and lochs sparkling brightly in the landscape. After a succession of rising corners that, like some "Will o' the Wisp," lead the traveller to the hope of the journey's end, there stands a stone by the roadside inscribed with the words "Rest and be thankful." They were echoed in the thoughts of every motorist—whether driver, passenger, observer, or mechanic—as he, or she, observed them on Saturday, ere proceeding to zigzag along the dark shadows of Glen Croe to the beautiful village of Arrochar, keeping guard over a corner of Loch Long.

For they came near the long pilgrimage of nearly seven hundred miles over roads smooth and stony; plashing through storm clouds on the mountain and gaily coasting along the braes in the Highlands; rising to mountain heights and conquering the highest roads in Great Britain, or rushing headlong down precipitous tracks with corners that turned again and retreated further to the glens, where rich fir forests and bare rugged earth alternated in wayward profusion of nature, untamed by men or restrained by machinery. The Trial of last week was a test such as is only possible in the "land of brown heath and shaggy wood"; it tried men and cars alike; it revealed the over-mastering supremacy of the automobile, and those vehicles that endured the four days' trial over specimens of all roads, and amid samples of every kind of weather, deserve well the success that should follow the achievement.

Of the seventy-nine that started from Glasgow on the morning of the 13th sixty-eight returned to the city of St. Mungo on Saturday evening, and of the survivors no fewer than twenty-five made absolute non-stop runs (save for tyres) on all the days of the Trial. Compared with last year's results, and having regard to the severity of this year's test, such a record is extremely gratifying to those watching the progress of mechanical matters, as well as details of design in motor-car construction. Several of last year's "non-stoppers" have repeated their success, viz., Mr. H. Ramoisy (Germain), Mr. F. S. Bennett (Cadillac), Mr. R. Crossley (Belsize), Mr. Claud Hamilton (Gladiator), and Mr. J. W. Stocks (De Dion), while cars included in the successful lists each year, but handled by different drivers, are the Albion, Argyll, and Humber. The Vinot narrowly escaped the double honour owing to the dust choking the carburettor and delaying the flow of petrol two minutes on the last day—a finicking little trouble that in no way discounts an excellent performance. Mr. Mawdsley Brooke and Mr. Ross Brown are

also entitled to commiseration, the latter losing a few trifling marks on the first day owing to driving a car which had not been tuned up for the occasion, and Mr. Brooke's ignition device lost him the opportunity of making a second record.

On another page we present a full view of the results in tabular form, compiled from the Observers' sheets, and to be accepted as a provisional list rather than the final official return—from which, however, it is not likely to differ in any substantial degree. From this it will be seen that Mr. R. L. Jefferson lost distinction by only one mark, while the other

Rover car had to be withdrawn owing to broken steering gear. The Adams-Hewitt, the novel departure from British practice in which were described in our issue of the 9th inst., made a good impression on its first appearance in such an event, and, save for a carburettor adjustment, would have had a clean sheet. Mr. F. W. Peckham's troubles were few and of a very minor order, and his Maxwell ran strongly and well. As was the case with many cars, owing to the prevalence of dust, the Pope Tribune suffered from a choked carburettor on the first day; the Swift was more fortunate and lost only one mark—officially credited as an engine stop.

In Class 2 Scottish cars predominated. A slight adjustment of the clutch cost Mr. E. A. Rosenheim, who was driving the 12-15-h.p. new Arrol-Johnston, a place of distinction, and troublesome stops incidental to driving spoiled the chances of the 10-12-h.p. Argyll, the 10-h.p. Darracq, Mr. J. P. Dean's

14-17-h.p. Scout, whose third day's performance lost him three marks, and the 10-h.p. Alldays. The 12-14-h.p. Scottish Aster ran well, but had to allow its passengers jumping exercise on one or two occasions, otherwise its performance was a meritorious one. The 14-h.p. Vulcan, which, like the Alldays vehicle, distinguished itself at Frome's Hill, lost four marks owing to commutator troubles. In this class the 16-h.p. Reo, illustrated in last week's *M.C.J.*, attracted much notice, this being its *debut* in the motor world on this side of the Atlantic. That it made a non-stop run on the first day was a significant foreshadowing of its quality. On starting from Edinburgh a minute's delay occurred, which cost one mark, and on the third day's run another mark was forfeited owing to the ignition. Save for punctures on the last day it made a splendid entry into the ranks of this season's competitors for public favour.

Non-stop daily runs in Class 3 were as plentiful as the gorse on the hills. Out of a possible aggregate of seventy-two, no fewer than forty-six were made—a capital result bearing in mind the class of country traversed. Seven vehicles out of nineteen journeyed the whole distance without losing a mark,

The Organisers of the Scottish Reliability Trial—Mr. E. J. Smith, the Hon. Secretary, with his portfolio (on the right), and Mr. John Adam, who started the cars each day (in the centre of the group).

The Arrol-Johnston dogcart proved itself slow and sure—a vehicle scarcely suited to the park, but well favoured in the sporting regions of the Highlands. In this class was a team of three Argylls—one was credited with non-stop, the second lost a single mark for an engine stop, and the third was troubled with a choked carburettor, but as a team the trio were consistently good. Messrs. Crowdy and Ramoisy did well, the former coming again to the front, as he did in the Phoenix Park races of 1903, and the latter delighting the Scottish people with his genial recognition of their salutations. But for having to change sparking plugs, Mr. E. H. Arnott would have been in the select list of those who lost no marks, and had there been an appearance competition—something of the kind will have to be attempted if the credit of motorists is to be sustained—it would have been won by him. His 22-h.p. Minerva had a screen of sufficient height to preserve him from the dust that rose without regard to anyone's feelings, and so enabled him to step from his car almost as spick and span as though he were in the show room. Reference has already been made to the exceedingly hard luck of the Vinot, while ignition troubles bothered the 12-16-h.p. Clement Talbot

of the abnormal clouds of dust which seemed to transform Scotland, in parts, into a great Sahara. Among these were the 18-h.p. Arrol-Johnston and the 24-32-h.p. Gladiator; Mr. E. E. Leverett was another victim of circumstances, his 30-h.p. Standard having a good appearance on the road and travelling as though to certain victory. On the first day the tail lamp fell, and a mark was lost in picking it up. Then at Pitlochry his radiator was damaged in the garage by the thoughtlessness of an attendant, and he lost four minutes on Saturday in refilling the water tank. But for these mishaps the Standard would duly have come into the list of successful ones. The 24-30-h.p. Enfield shared with the Austin the novelty of newness, and started well from Glasgow, but trouble occurred with the petrol pipe connections, and on the second day it was withdrawn owing to the pipe breaking. The new Austin did well, having three non-stops to its credit when, on the last day, a new key had to be fitted to the sprocket shaft—ruining the prospects of victory in the competition. The experience of both these cars demonstrates the advisability of running new vehicles some time before participating in such a severe test. The six-cylinder Brooke had not travelled more

The Scene in the Garage of the Western Motor Company at Glasgow when the Cars were in position.

on the first day, and prevented the car making the record of which it is easily capable. The Mass car also suffered the ills of fortune, as is duly set forth in our record of the third day's run.

Passing to the returns of Class 4, which attracted the largest entry, nearly fifty per cent. of the entrants secured non-stop awards. The success of Mr. J. H. Paterson's Peugeot atoned somewhat for the misfortune of Mr. C. Friswell in the next class, and again demonstrated the reliability of this type of car which has been before the public practically since the beginning of the movement in this country. Non-stops were also secured by the four-cylinder Albion, running for the first time in a public trial; the new Arrol-Johnston, with vertical engine; the Siddeley, driven by Mr. T. Shaw, of Dundee; the Darracq, handled by Mr. Sidney Girling; the 25-30-h.p. Iris—another new-comer—driven by Mr. A. Clifford Earp, a brother of the Earp who has figured so prominently in motor competitions of late years; the Pilain, driven by Mrs. Loder; the Belsize, with its high-tension synchronised ignition; the 30-h.p. Bell, the Spyker, the Pipe, and the Gladiator. Here consolation must be accorded the victims of choked carburettors, a consequence

than three hundred miles before the Trial, and consequently was untuned. But the running of the vehicle, ere the magneto arrangements went wrong, showed its capability. The passengers on the St. Vincent were unfortunate in the fact that the car ran out of petrol near the Bridge of Avon and they had to walk some miles to secure a replenishment, the loss of time thus recorded being 1 hr. 42 min. Ignition bothered the 20-24-h.p. Horbick considerably, and prevented it appearing at its best. Mr. P. W. Northey with his Rolls Royce had petrol troubles, but Mr. Claud Johnson was able to enjoy the pleasure of a non-stop run in Class 5, where further instances of the fickleness of fortune were evident. Mr. Oscar Cupper's 30-35-h.p. Metallurgique is a car that did well at Frome's Hill, securing excellent times. It also did well in Scotland, having non-stop runs on the first two days, and also on the fourth—the worst route of all—but quite a minor detail upset the record on the third day. Similarly the replacement of the fan belt spoiled the record of the 40-h.p. Benz by the loss of a single mark. Captain Wentworth's Daimler was a feature of its class, taking hills in glorious style, and going reliably on the level; while Mrs. Riley's withdrawal was matter of general regret.

**FIRST DAY.—Through the Country of Burns.**

Blythswood Square, Glasgow, was invaded on the morning of the 13th inst. by seventy-nine motor-cars of the competing class and a score or more which might be regarded as of the non-combatant order. Scotland, in the form of a couple of Albion cars, had the position of honour—in fact, of the competitors northern Britain supplied one-fifth, international significance being given the Trial by the presence of English, French, Belgian, and American vehicles. Punctually at 7 a.m. the first car was sent on its way, and within an hour and a-half the Square had resumed its normal appearance. We went out of the city of St. Mungo by Giffnock and Newton-Mearns, finding a gradual ascent for about ten miles after leaving Glasgow—to say nothing of the tramlines and a northerly wind that presaged the passage to a cooler clime ere long. At Fenwick the first of the victims of tyre trouble was despatched, and then at Kilmarnock—to which tramlines formed an introduction—the Burns country began, and interest in the journey increased. Shortly after leaving Prestwick, with its golf links and picturesque houses, a glimpse of the sea was afforded, and through Ayr the motorists had a hearty welcome, passing by Burns' Cottage and Monument with the sun seen for the first time during the day.

As mentioned last week in a telegraphic dispatch from Dumfries, our "mount" for the day was a 25-36-h.p. (5-59 in the official list) Brasier—a powerful, easy-running vehicle driven by Mr. Ross-Browne, a leading member of the Nottinghamshire Automobile Club, and a merry companion for a run of 174 miles. It was a comfortable car, with a luggage carrier at the rear, leaving the tonneau clear for the stretching of legs, so conducive to comfort on a long day's run. More than that, its economical running was a feature, and on the shores of Loch Fyne, on the last day, Mr. Browne assured us he had driven ninety-six miles on four gallons. The High Street, Ayr, has a curve, and, whether from a love of commerce or of literature we know not, but the people make much of Burns. The Wallace Tower and Tam o' Shanter Inn were left behind, and at Patna the first ten mile limit was reached. Many such were afterwards found on the way, and it would seem that the Secretary for Scotland permitted the erection of such devices of restraint wherever they were wanted, and in many places where they were not required. At Waterside, a black, sullen mining village, with great heaps of shale thrown up darkening the landscape, and casting a gloom all around, the miners' wives stood at the doors of their cottages—a monotonous row of buildings with a sameness and a tameness fit for an antiquarian corner in the Garden City of the future. They cheered with vigour and waved their aprons with delight. And then the children—barefooted and lusty-lunged youngsters, merry for the hour's absence from school allowed to see the motor-cars. They fairly yelled with delight, and seemed to enjoy the dust as though 'twere a familiar morsel to their palates. As for the motorists, they had disappeared, and not a car did we see as through Carsphairn we went into a pleasanter country described by S. R. Crockett in "The Raiders"—a modern novel telling of this district—ten miles from St. John's Town of Dalry, with its conspicuous church and loose roads. And thus ended the second "control"—within a couple of minutes of the minimum time. A good run from thence of 26 miles, for which 1 h. 23 min. was allowed, led to Dumfries, the way being of the curly-wurly order about Balmacellan, and sharp bends giving the drivers an inkling of what was to follow on later days. All Dumfries was on holiday bent; the banner of the "Continental tyres" waved in the breeze, and into the yard of the King's Arms Hotel drove the dirtiest, dustiest crowd of living men that the people had ever seen in the respectable town of Dumfries, accustomed to pilgrims who have regard for appearance—and motorists have none.

An hour was allowed for scraping the coatings of dust—with which all were masked—and for rushing around the feeding tables. The most easily obtainable aids to sustenance were the luncheon tickets; evidently the early arrivals had abnormal capacities, and those who came last waited longest. But even luncheon hours end—especially when from them are taken

thirteen minutes for replenishing and lubricating and two minutes for starting.

Then away to Moffatt and the hill climb. About ten miles from Dumfries scenes of sylvan delights began to appear, and strangers to Scotland recognised something of the beauties they had expected. Narrow lanes with turns, descents, red triangles and other features demanding care from the drivers predominated all the way to Tailburn Bridge, where the first hill climb began. The Berkhill climb was but a prelude, the average gradient being 1 in 17; the ascents averaging from 1 in 14 to 1 in 23, with a rise of 305 feet in 1,745 yards. It was a steady climb and good times were made by most of the vehicles, the order of speed in each class being set forth in the table given elsewhere—presenting a fairer criticism than any personal impressions might do. It was then a sinuous course to Peebles, where the landscape assumed a quiet beauty and something of the real scenery of Scotland appeared. By loch and burn and under the shadow of tall hills, with dust accumulating on cars and passengers all the way, we passed through Penicuik up into the glories of Edinburgh. The great castle frowned from its eminence on the dusty wayfarers as we strode by the University buildings and hospital into Spital Street, where the fine garage of Messrs. J. Croall and Son afforded cover for all the cars. Later in the evening strange figures flitted about the modern Athens—around Scott's memorial, with its little statue in a great mass of monument; by St. Giles Cathedral, standing where Knox is buried and over the Heart of Midlothian; down to the Tron Church and the house of John Knox; and away up to Calton Hill, where the great pillars stood gaunt and quaint in the twilight. Even at such an hour the sight was impressive; Leith cowered down on the one side with the Firth of Forth stretching seven miles from land; on the other Salisbury Crags and the Radical road led away from the historic castle of Holyrood; and but a few yards below the one mile of Princes Street cut the city in twain from east to west with its electric lights illuminating the famous artery with a brilliance that stole in and out of the City spires with all the penetration of the modern spirit into the recesses of the ancient world. And amid such scenes—and others—the motorists ended the first day of their trial.

It was unfortunate that Mr. Buchanan Shiell, of Perth, who drove the Maudslay, should have had to reverse at the garage in Edinburgh in order to avoid the crowd, and so sustain a mishap to his clutch. Really this was no fault of his. The Enfield retired owing to a breakdown which could not be properly repaired on the roadside. This was due to the flange (which is a part of the cylinder) breaking off where the water connection is joined, owing to a peculiar flaw in the metal which could not be detected in the fitting, and which did not develop until after the car had been run some distance. In the ordinary way this would have been discovered in the testing, but, very unfortunately, this was postponed until after the Whitsuntide holidays, and instead of the workmen coming in on Tuesday, as required, they practically made a week of it, and a pressure of more important work prevented the thorough testing of the car. It was a piece of exceedingly bad luck, and something which is absolutely unique in its way as far as the Enfield Company's experience goes.

Of the seventy-nine starters from Glasgow practically all arrived safe and sound, a great advance on earlier contests we have known. Forty-four made non-stop runs and many of the stoppages were quite trivial, in no way associated with the mechanism of the car.

**SECOND DAY.—Away to the Highlands.**

If, as may be imagined from the record of the first day's run, the impressions of the journey from Glasgow to Edinburgh were of a somewhat ordinary nature, those of the second round were very different. The course was from Edinburgh to Aberdeen by the Bridge of Allan, across the City of Perth, up the highest mountain road in Britain, and through the Royal country of Balmoral and Deeside, to the Granite City of the north. It was the longest run of the tour—177½ miles—and many of

the cars were twelve and thirteen hours upon the road; but the time never seemed weary, so beautiful was the country through which the calvacade of motorists journeyed to their objective for the night. We were on the Brooke (4-58), driven by its designer. At Corstorphine two roads converged, and, avoiding that by which the cars came from Glasgow last year, we took the right one for Kirkliston, where the aspect of the country changed. Town was left behind and rural delights began. At Winchburgh there was a slight odour from the great oil works at Broxburn, but it was only a tinge of smell. In place of the wallflower that bloomed so freely when the 1905 trial took place—a month earlier than now—was the lilac and the rhododendron, and in the cottage gardens was variety indeed. Through the Dalmeny country the road was taken to Linlithgow, which we dusted in atrocious fashion. The citizens of Laurieston had been wiser in their morning and generation, for the High Street had been watered, so that we could see the houses and their inhabitants could see the cars. A touch of humour occurred in the route-book, for we were told to descend slowly through the town, and then shot down as steep a hill as any civilised community could endure. After a few miles of industrial aspect, the country gladdened into delight across the field of Bannockburn and

Scotland, we reached the City of the Fair Maid, and crossed the Tay. Then the path was by Old Scone and Cargill to Meikleour, where a famous hedge of beeches stood out prominently in the view, their leaves almost yellowed by the dust of nearly four-score cars careering on to Blairgowrie, where their passengers lunched and their engines rested. Blairgowrie is delightful to the eye—and to the fruitarian—its fields of raspberry canes standing like pigmy hop gardens, while women worked, in contradiction of Kingsley's view that "men must work, and women must weep." The women did anything but weep; they came to the hedge sides and, waving their aprons like banners in the breeze, laughed, and laughed again, at the motley motorists who had one common covering—the dust.

That removed, we cheerfully adjourned to the police station, in the large hall at the rear of which replenishment and refilling went on for the allotted time, and then, in the most brilliant sunshine of the tour, a re-start was made for the hill climb, and the even more severe ascent to reach the Spittal of Glenshee. For twenty-five miles the route presented a series of innumerable sharp turns and steep hills, and on the landscape wide fields of white blossomed strawberries added variety to the scene. At the Bridge o' Cally was a particularly twisty corner, and then onwards and upwards went the cavalcade. Cars came

The 20-22-h.p. Mobile getting round the Devil's Elbow on Cairnwell Hill.

through Stirling, delightful in its environment, but with trams of the old-fashioned equine order, such as give the Promenade at Douglas a touch of the antique.

The next control was from Stirling to Perth, through several places of considerable size—for a country with less than the population of London. Reclining in the six-cylinder Brooke with its cosy armchair tonneau was a real delight—no vibration, no jarring notes, no cramped limbs; just such a car as one can spend a day in without discomfort. With Mr. Mawdsley Brooke at the wheel, and Mr. W. Humphrey, his partner, as mechanic for the nonce, we had a delightful day of ease and interest. Danger signs were plentiful, and the usual unnecessary ten mile limits were everywhere. Only a few cars came within our immediate purview. Once we sighted Mr. O. Cupper going well on his comfortable-looking 30-h.p. Metallurgique; the two-cylinder Maxwell, with Mr. F. W. Peckham at the helm, made pretty progress up the mountain sides; the Iris, driven by a brother of the more famous Earp, made a favourable debut, and Mr. Dean's Scout showed up well.

The way to Perth was full of interest. Advance to Dunblane was by way of the Bridge of Allan and then through Auchterarder, one of the most ancient of the Royal boroughs of

and cars went, but the trusty Brooke seemed as though 'twould prove Tennyson a correct prophet, as well as a poet. Over mountain roads we steadily ascended the defile between the hills, narrowing and turning, while in the distance the snow-swathed cairns reminded those familiar with the road that only a few weeks ago it was impassable, and a way had to be cut through the snow. When we arrived on the Cairnwell Hill, with its summit 2,200 ft. above the sea level, others had already left, being despatched without delay, their water warming to the occasion. Some of the cars as they arrived were emitting steam in clouds, and though their drivers confessed it not, many were glad of the opportunity to cool their engines. For three weary, dreary hours they waited for the chance to get away, and loud were the calls for provender, liquid and solid. And yet there was beauty in the scene. Great mountains encircled the wild pass, where the heather was purpling into flower. Now and again the harsh notes of the grouse were heard, while even the click of the camera seemed to lessen the monotony. Bad luck had proved ungallant to Mrs. Riley just before reaching the hill.

The road leading to the starting point of the hill climb was ever ascending and ever twisting, and Mrs. Riley, of Haslingden, driving the 24-34-h.p. Belsize, had decided hardship in her car

being brought to a stop by a mishap to the clutch. When we passed she was standing on the bridge gazing disconsolately at the little burn that trickled and sparkied in ungallant disconcert of her trouble.

The length of the timed portion of the hill was 3,678 feet, the average gradient being 1 in 8.9 and rising to 1 in 7.5 in places. The Devil's Elbow is apparently a device of the Evil One to make hard the way of those who go that road. It is more treacherous than the Hairpin Corner at Ramsey, turning upon itself like an Australian boomerang. Then, too, the surface at that point was as loose as the sand of the seashore, and the cars had to literally plough their way. Most of them were equal to the occasion and did well; a few required the application of manumotive power at the rear. The 30-h.p. Daimler was admirably steered by Captain Wentworth. As he rose from the second bend the rear wheels turned into the gully at the side of the road, and his overthrow seemed imminent, but, with a great lunge, the car drew out into the road, amid the loudest applause of the day. Mr. Cupper was unfortunate in having his brake on just above the Elbow, and so lessened his speed; but when he withdrew the brake the Metallurgique went forward in style, and its going up the last part of the hill was a capital performance.

Among the spectators was Mr. C. Friswell, who had withdrawn his car owing to clutch troubles, and now amused himself with the camera. Away we went on the Brooke, which seemed to have a premonition of coming misfortune. And then into the Grampian country. New delights met the eye everywhere, but never a car. For, truth to tell, the drivers were desperately hungry, and the cars travelled with a set determination, so that it was a hasty run to Braemar, the beauties of nature being almost unheeded. Russet browns and vernal greens formed a vision of delight, while purple peaks rose strongly unto the sky. Long and steep descents opened upon a great plain, where little farmsteads found shelter amid the firs. The fruits of cultivation alternated with great stretches of heather, and sparkling rills glistened in the waning sunlight. Alas! in the beauties of the Braemar district misfortune may lurk. Mr. W. Gutmann found it when driving the Chenard-Walcker car. He was nearing the pleasant town by the Dee when his transmission gear went wrong, and after a fifteen seconds whirligig the car stopped. The repair necessitated the removal of the gears and the replacement of the wheel on the plain axle—a matter of considerable time. Mr. J. Livie was a passenger, and with the Observer he proceeded to trudge to Braemar. A passing competitor, one of the Gladiators played the good Samaritan, and, slowing down, took the travellers on the steps to Braemar. There they obtained a horse, which towed the stranded Chenard-Walcker car to its stable for the night. And the passengers slept the sleep of the disconsolate. They were sixteen miles from the nearest railway station, at Ballater, whither they proceeded the next day by the motor-bus service. The erring car was dragged along the highway by a couple of equines, and packed off to London—by train.

On we went through Ballater, Aboyne, and Banchory, at which latter place Montrose rested before entering the Granite City. We would fain have done the same, but the timekeepers were at Aberdeen, and thither flowed the Brooke with its six-cylinders and four passengers. What a delightful country! The grand road through Royal fir forests showed Scotland in her majestic aspect. Down in the valley the Dee pursued its sinuous course, and a few solitary fishermen looked up from the river as the cars speeded by. A few miles away the tower of Balmoral Castle rose above the tall trees, and then a glimpse of Queen Victoria's Highland home, standing amid scenes of peaceful beauty, was accorded to the voyagers. To the left was Crathie Church—the little kirk associated with the lives of Monarch and peasant in that region of calm confidence and trust. Abergeldie Castle was passed, and then, through Ballater and Dinnet, we entered the granite country. The last twenty miles was a triumphal procession, fair maidens showering bouquets with a winsome grace that gladdened the hearts of the young men and brought smiles to the cheeks of the old. Hardly a car escaped

the offering of rhododendrons, white lilac, and other lovely flowers, carefully tied with notes conveying "good luck and good wishes." From the homes of the Pithies at Turner's Hall, Ballater, and the Thains at the Kinnore, Denet, came scores of such floral tributes; and on behalf of the motorists generally we give public utterance of their appreciation. Away into Aberdeen we went, and a great crowd awaited the cars in the strong, bold city, where garages are plentiful—and that of Messrs. Claud Hamilton is one of the largest.

### THIRD DAY.—A Journey of Ascents and Descents.

There was rain upon the mountains when we left Aberdeen, and all the morning it beat obliquely on the motorists as they went northward through Huntly and Keith—not a very interesting country; at least, so it seemed with the rain drops pricking our faces relentlessly and pitilessly. We were on the Vinot, driven by Mr. Gordon Usmar, with Mr. Harman Wigan in the tonneau to assist in case of need—a necessity not likely to arise in a car of such merit as our mount on the third day. The first forty miles was to Huntly, and through scenery in many of its features resembling the Peak district of Derbyshire we made successful way, a goodly crowd lining the streets and market squares of the town. Huntly to Tomintoul proved a far more interesting control, including a trip through Keith, the most northerly part of the tour. A Scotch mist enveloped the mountains, hiding them from view, and saturating all who rode on cars. The ruts in the roads filled up with water, which splashed the hedgerows as the cars ploughed their way on to the highest village in Britain, viz., the hamlet of Tomintoul, with its trim square, its couple of hotels, and an air of prosperity not usually associated with such an elevated position. The valley of the Spey provided us with some interesting scenery, and gave Mr. Mawdsley Brooke an unenjoyable experience. He was proceeding through Dufftown when the pin carrying the platinum point on the magneto snapped—and he was stranded. As we passed consolations were offered; but later in the day we found that the motorists had been royally regaled in the neighbouring distillery of Glenlivet, which was inspected while repair was accomplished—too late, however, to turn Mr. Brooke from his determination of withdrawal.

As we rose the rain ceased—in fact, it did not appear to have visited Tomintoul—and all seemed well as we neared the Bridge of Avon. There came a short, sharp hill, up which we ran at a good rate, when we stopped within five yards of the top. Brakes were applied, and we walked half a dozen yards, to find half a dozen cars lined up for the reputed hill climb. Our petrol supply had failed to reach the carburettor, that was all. Others were in almost similar plight, and foraging expeditions to Tomintoul and round about were set afoot. Supplies from some cars not in the competition were commandeered, and spirits rose with the distribution of the available resources in the way of petrol.

All this delay led to the discovery that the first car had stopped ere its time. This nasty bit of a hill with an awkward bend and a stiffish gradient just where least desired was but the way to the test. It proved tougher than that of the timed distance, and some of the cars nearly made good "copy" for the representatives of the daily press thirsting for news of accidents rather than incidents, and inspired with the one hope of being left alive to tell the tale. One car jibbed near the top; the Mass was going up well behind, and to avoid collision the driver, Mr. A. F. King, had to back gently into the bank, where it tilted over, ejecting the passengers and rendering the observer unconscious for awhile till the car was righted, and he was able to resume his journey. Immediately behind was a car of Scotch production. The driver saw the Mass falling on one side and nearly jumped the precipice on the other in avoiding contact. The drivers assembled on the Bridge of Avon speculated as to the prospects, especially when the six-cylinder Humber stopped at the steepest part, enabling at least one photographer to secure a good picture of Mr. T. C. Pullinger under uncongenial circumstances. The Vinot,

replenished with petrol, took the hill and then got on to the measured distance, where we were timed as in a police trap. From the highest point there was a sharp descent to the Bridge of Brown, along which cars dropped down as into a water chute—certainly the steepest decline, with the sharpest corner of the whole tour. It was enough to try the nerves of any driver unless fully confident of his brakes. "We are all right," said Mr. Wigan, as his partner negotiated the perilous bridge and drove us in good style to the Grant Arms Hotel at Grantown-on-Spey, where we recited our worries of the day over the luncheon table, and rose, like the proverbial giants, refreshed. The last portion of the run had been over a loose road.

The rest of the journey to Pitlochry—seventy miles—was uneventful. A grand run was made by the Vinot to Aviemore and Loch Alvie, around which careful driving was necessary. After Kingussie the railway was in view most of the time,

#### FOURTH DAY.—Through Sunshine into Glasgow.

Scarcely had the dust of Killiecrankie been rubbed from the eyes of the sleepers, when the matutinal motorists disturbed the silence of Pitlochry with the rattling of cans and the cracking of jokes in the main street at five o'clock in the morning. They really arose before it was dark, for the one or two who kept vigil for the morn declared that there was light from the time they read the *M.C.J.* in a garden at 10 p.m. till the boots at the hotel awakened the motorists with a tooting and a piping of considerable vigour. No time was allowed for collecting news, but a few instances of garage treatment, reminiscent of some dark doings of the 1,000 miles trials, filtered through. While the cars were being directed to their places in the tent on the previous evening one had cannoned with the Standard and disjointed the rear cross-piece connecting the springs. "That was nothing," Mr. Leverett told us, when preparing for home in the morning, "but I had to hold my

SCENES ON CAIRNWELL HILL.

separating the country in a really marvellous way. On one side of the line great forest trees rose proudly; on the other vegetation was sparse, and the double row of paling told of the ravages of the winter's snow on the bleak aspect. From that point a long gradual ascent over the Grampians commenced, with mountainous scenery all the way to Blair Athole, where we had a passing glance of Athole Castle, and saw one of Scotland's most favoured inland resorts. And then the Pass of Killiecrankie, with its wealth of vegetation, its great sides laden with trees, a beauty all its own. The horns resounded through the glen and away we sped to Pitlochry—most healthy and most picturesque spot in a country full of beauty.

The results of the day's run were excellent, and the non-stops greater than on any other day, as is shown in our table on pages 368 and 369. As for the Vinot upon which we rode, its running was a pleasant experience of ease and comfort throughout the day.

mechanician when a fellow shouldered the radiator to back the car, and in so doing raised the tubes from their bottom fastenings. But he travelled with his burst radiator, and was rejoicing later in the day with a non-stop run, using only a gallon of petrol for eighteen miles, and his car has six cylinders, it must be remembered. Mr. Leverett's was not the only case of bad treatment in the tent. The 18-h.p. Arrol-Johnston Tourist trophy car, driven by Mr. E. Robertson, had lined up for the start from Pitlochry, when, during the time allowed for replenishment, sand was discovered in the oil inlet to the crank chamber. It had evidently been placed there surreptitiously overnight, and naturally the competitor thereupon retired from the contest—a regrettable incident in a trial so full of pleasantness and good-fellowship.

For nearly a dozen miles the route of the previous day was reversed, and the grand Queen's View was opened up in full glory. Away to Blair Athole the camp of the Scottish Horse

was awakened with our hootings and pipings, and then the route of the previous day was left at Calvine and a winding road led to the hill climb at Trinafour. The measured distance was 1,378 yards in length, with a total rise of 351 ft., equivalent to an average gradient of 1 in 12.9, the steepest point being 1 in 7.5. Practically all the cars went over the hill, only one being left, the fastest in their respective classes being the 9-10-h.p. Swift (with the Adams-Hewitt a creditable second); the 14-h.p. Vulcan; the 16-20-h.p. Beeston-Humber; 20-32-h.p. Darraq, and the 30-h.p. Daimler. From the top of the hill climb to Tummel Bridge and beyond to near Kenmare the road was but a ribboned track winding in and about a great strath, with the waters of the loch as blue as the empyrean above. The scene grew in grandeur as we kept on the way, Ben Lawers and Ben More, with their snow-covered peaks, towering above the minor hills of green and other radiant hues. For miles we had the road to ourselves, and only a sister Argyll passed by. At Killin we got into a procession of cars, and the joy of Nature was dulled with its dust. The Falls of Dochart had nearly dried their tears, and still turning and twisting, striving and straining at ascents and declines, the dusty cavalcade dashed on, one or two cars being guilty of deviating from rules. And so on through Tyndrum to Dalmally, where the road narrowed to a mere strip of a track, with a succession of "dromedaries," hump succeeding hump, and bump following bump, as though an Irish road was being rushed at top speed. Turn followed turn, each one more angular than its predecessor, culminating in a steep winding descent leading to Dalmally, where such a royal welcome was given the motorists last year. Then it was the place for lunch, this time but an incident of the way. A long descent opened out a panorama of entrancing beauty. Loch Awe slumbered peacefully before us, and lordly hills towered all around, clad with verdant beauty. Proceeding due south, a well-wooded glen led to the arch by which we reached the shadow of the Castle at Inverary and the shores of Loch Fyne. There we rested awhile, and prepared for the last stage of the journey. Mr. Campbell Muir, whose Highland home is not far away, met the early arrivals—a picturesque figure in kilts.

The next stage included the treacherous descent through Glen Croe, a dark mountain pass along which the cars zigzagged with brakes sternly applied. Rounding the loch a steep rise began at Cairndon, and the road went up through Glen Kinglass towards Ben Ime, towering 3,000 ft. Then came, to the uninitiated, one of the great surprises of the Trial. From the faithful programme, which never erred in detail, it was clear we were going towards a place indicated as "Rest and be Thankful." Some of the wayfarers thought it indicated a mountain spirit, or mountain dew. Alas! it was but a stone recording something or other about a mountain road. But, horrors! There, down on the left, steadily creeping along a road practically hidden to view, was a car, and then another, until the descending hillside seemed alive with moving heads that glided among the brown earth like ants over a mound. Twenty yards beyond the stone was an acute angled roadway the other side of which jerked back into the mountain side and then zig-zagged to a perilous descent. Mr. Muir had come to see the fun; near the top of the ascent one car had nearly stuck, with the result that those following had to take care; the last in the procession, the six-cylinder Humber, backed to the rut at the side and turned at right angles across the road. On our 14-16 h.p. Argyll we narrowly averted collision. Then boldly to the top, with the representative of the Campbells shouting "Scotland for ever!" as we rose on the back of the hill and over its shoulder to the wild pass of Glencroe with its mighty heights and lowly valleys bathed in sunshine and spread out like a map before the vision. After such an experience the quieter nature of Loch Long with its peaceful calm came as a relief, and by way of Arrochar the shores of Loch Lomond were reached, Ben of that ilk gloomily watching over the scene from the other side of the lake. The undulating run along Loch Lomond, with its frequent twists and turns, and with the stream of traffic from Glasgow, proved a strain on many of the drivers at the end of their long tour. Mr. A. E. Crowdy was steering his 15-h.p. Siddeley along the

road when a private car came alongside, and it was only his smart driving that averted a collision. Such was fortunate, for both of the Siddeleys—the 24-h.p. was driven by Mr. T. Shaw of Dundee—made non-stop runs on all four days, a consistent performance, remembering the arduous nature of the course.

Quickly passing the resorts on the loch, and noticing that the streets of Luss were laid with Crempoid—the newest of dust-laying preparations—Alexandria was reached, where we had a rousing cheer, many of the men from the Argyll works having assembled in front of that building to cheer their comrade Somerville, who drove the 14-16-h.p.—and drove it well. These men are loyal to the company; one was once asked to locate the situation of Ben Lomond to a stranger, and could only reply that "It is near the Argyll works."

Through the succeeding townships we made good pace, joining a dozen other cars in raising the dust—a dust full of strange tastes and wholly unlike the sand of Dalwhinnie or that of the Burns' country. The air was murky with smoke from the chimneys of the Clyde, and a wet mist assembled the constituent elements until the approach to Glasgow was as obscure as London in a November fog. Then we began to crawl, and sandwiched between the Minerva, with a sharp journalist on board, and the Humber, carrying an Irish wit, we entered into a race of sloth. Mr. J. W. Stocks, a whilom Gordon Bennett hero, joined in the tortoise-like procession. "Lame ducks" was the observation of the policeman at Sauchiehall Street. We scowled as well as the caked dust would allow us to vary the expression of our countenances, and, with a spurt to second speed, filed boldly into the garage; Mr. E. H. Arnott, as ever, in the premier class for appearance—thanks to a protecting wind shield—ourselves part of the dustiest, dirtiest contingent on the road, for we had kept to time and encountered all the dust raised by those who hastened out of their order, as well as by a Darraq that marked the conclusion of its run by slicing off a piece of the Martini mudguard, an act of vandalism that seemed likely to arouse a protest from Mr. E. G. Williams, a director of the Martini Company, whose driving was one of the features of the Trial. He did it for fun—just to see Scotland. He saw Scotland, and is not likely to again take part in such a test; it is not all fun.

And the crawl back to the beginning was perhaps the most undignified ending that could be imagined to such a glorious tour of the land of the mountain and the flood, especially as sixty-seven out of the seventy-nine starters returned unscathed from the contest.

During the day there were forty-three non-stop runs and a couple of withdrawals; the 14-17-h.p. Scout after an exceedingly good record had to give up, and the 20-24-h.p. Horbick also.

#### WHERE CREDIT IS DUE.

A word must be given to those responsible for the organisation of the event. Those who participated in the first of these runs knew that the arrangements would be perfect and that there would be no flurry or excitement. The hon. secretary of the Western section of the Scottish Automobile Club delights in the intricacies of the organisation of such events, and the calculations incidental to the performances of eighty cars on hill climbs and the apportionment of marks for various points is a delight to his mind. His capacity for ubiquity is unlimited, and he seemed to be everywhere, never losing the urbanity of deportment that is as natural to him as devising formulæ and doing the work of a dozen committees. And so he is mentioned first. Mr. John Adams was an insistent starter, succeeding in getting everyone away in good time, being assisted by Professor Archibald Barr and Mr. H. M. Napier. Mr. J. M. Ross had an equally arduous task as rear marshal, following the laggards and despatching news to headquarters of those who fell by the way. Messrs. J. Cranb and J. B. Talbot-Crosbie were responsible for the commissariat arrangements, particularly excellent at Blairgowrie, Inverary and Grantown. At the various hill climbs we noticed Messrs. J. R. Nisbet, J. Hunter Steen, C. J. Campbell Steen, L. C. Seligmann, W. Weir, Young and Mackenzie. The timekeepers were Messrs. Bartleman, J. Russell, Swindley and W. Wilton.

Messrs. Bristow and Napier acted as motor-cyclist scouts, doing infinite work in a minimum of time; and at Edinburgh and Glasgow the Right Hon. Sir J. H. A. Macdonald, K.C.B., the Lord Justice-Clerk of Scotland, gave legal welcome to the motorists. But inspiring and directing all was the organising genius, who never tired of answering questions and directing events.

With regard to the tyre troubles, some interesting notes may be made from a review of the performances of the various cars. On the first day nine cars were delayed for this cause, thirteen on the second, five on the third, and only two on the fourth. Class five seems to have escaped with conspicuous success, as only one of the eleven cars in that category had a puncture. In Class 1, however, only two of the seven vehicles went through scatheless so far as tyres were concerned, despite the fact that they were fitted with non-skids of a certain make. The Albion's experiment of providing the solid tyres of the North British Rubber Co. for the back and Dunlops on the front wheels was a success, as was also that of the Straker-Squire in having Continental and Michelins on front and back respectively. The Kelvin car, which, but for a delay at the Devil's Elbow, would have made an absolutely non-stop run, had Gaulois tyres, which behaved

## SCOTTISH NOTES.

ON Tuesday the sun beamed out with a very hot welcome, and those compelled to spend some time in the fine garage of the Western Motor Co., in Berkeley Street, Glasgow, found work extremely unpleasant. Away at Edinburgh a cooler atmosphere with regard to motor matters prevailed. The Association of Tramway and Light Railway Officials was in progress, and the Edinburgh Corporation was practically invited to prohibit the competition of motor-buses with tramways in the Scottish capital, while it was decided to take no action with reference to a letter from the Motor Union calling attention to the danger to the public from the manœuvring of tramcars going in and out of depots.

ACCORDING to some of the Press the entries included a 24-h.p. St. Alban and a Pip car. The gradient on the Cairnwell Hill, just below the Devil's Elbow, was said by one correspondent to be one in seventy-five.

ALTHOUGH marked down on the report of the first test run in the Scottish reliability trials for a two minutes' stop in order

By the Shores of Loch Fyne—The 30-40 h.p. Belsize preparing to leave Inverary after lunch.

splendidly, as did also the Shrewsbury and Challiner tyres on the Arrol Johnston dogcart. On the Belsize, driven by Mrs. Riley, the Moseley tyres did well, and the Argyll which did a non-stop run had Le Persan tyres. Of the others in the trial due recognition must be given to the Continental tyres, which certainly had the smallest proportion of punctures of those which figured prominently on the cars. For the assistance of any who might require help—and they were singularly few—Mr. P. Brodtmann had organised relays of tyres and men at various points almost resembling the elaborated arrangements of a great Continental race. Mr. F. C. Baisley was equally ubiquitous in the interests of his well-known firm.

EXAMINATIONS for the A.C.G.B.I.'s driving and mechanical proficiency certificates are held every Wednesday at 119, Piccadilly, W. Each candidate for the paid driver's certificate is required to answer ten questions on the law affecting motor-cars, and five questions on mechanism. He has also to undergo a strict driving test in traffic, during which he must demonstrate his ability to control his car in any emergency.

to clean a plug, we are informed that No. 71, the 20-24-h.p. Talbot car, went through the entire trials without a single involuntary stop. In addition the car made good time on all the hill climbs, and thus followed up the successes scored recently by the Talbot in the Frome's Hill climb and the Edinburgh to Glasgow non-stop competition.

DURING last week several motorists called at the works of the Acme Rubber and Tyre Co., 343, St. Vincent Street, Glasgow, which are well equipped for the repair of every kind of motor tyre. All repairs which leave the Acme Works are guaranteed for three calendar months or 1,000 miles.

MESSRS. ROBERT TAYLOR AND SON, of Bannockburn, are running a motor-car from Stirling to the Ochil during the season.

A DEPOT for the sale of Swineheart concave solid tyres has just been opened by the Swineheart Tyre and Rubber Company at 117-119, Long Acre, London, W.C. The tyres are made to fit any form of Clincher rim.

## CONTINENTAL NOTES.

### The Paris-Tourcoing Industrial Vehicle Trials.

The trial of industrial motor vehicles, organised by the Automobile Club du Nord de la France, was brought to an end on Tuesday last week. Out of the twenty-five vehicles which started, the following seventeen completed the seven daily runs within the allotted time:—Class 1.—12-24-seated public service cars: Delahaye. Class 2.—Double-deck buses: Brillié I. Industrial vehicles:—Class 1.—Tri-cars carrying up to 50 kilog.: Three Contals and three Australs. Class 2.—Commercial vehicles for loads from 1 to 2 tons: a Clement-Bayard and a Latil *avant train*. Class 3.—Ditto from 2 to 3½ tons: an Aries, a Brillié, a Latil. Class 4.—Ditto, 3½ tons and over: a Latil, a Prunel, a Peugeot, a Brillié. The Latil Company wins the Regularity prize of the A.C. du Nord for successful cars in three different categories; and the Brillié Company carry off the Ministry of Commerce prize for a vehicle utilising carburetted alcohol as fuel.

### La Coupe de France.

The Paris daily "Le Matin" is organising a tour of France for touring-cars, starting from Dieppe, encircling France in twelve stages of about 200 miles each, and returning to Paris.

will be open to motorists on Sunday, Tuesday, Wednesday, and Friday. On the other days animal traffic alone will be permitted. July and August.—Open to motor traffic each day except Thursday. Motor-cars will not be allowed to cross the pass at night. Permits must be obtained from the gendarmerie at Bregue or Gondo, and the time occupied must not be less than four and a half hours.

### A Belgian Trial of Industrial Vehicles.

The Belgian Automobile Club has decided to hold a trial of industrial vehicles in October next. The event will comprise three daily runs: (1) Brussels-Antwerp; (2) Antwerp-Ghent, and (3) Ghent-Brussels.

### A German Light Car and Motor-Cycle Trial.

The German Motor Cyclists' Union is organising a reliability trial for motor-cycles and light cars to be held from July 5th to 7th. The event will be over a 560-mile course in South Germany, the first day's run being from Munich to Karlsruhe, 212 miles; the second, Karlsruhe-Wurzburg, 169 miles; and the third, Wurzburg-Munich, 179 miles. Full particulars of the test may be obtained from the Secretary of the D. M. V., 2, Victoria Strasse, Munich.

The Meet of the Hereford Automobile Club at the opening of Mr. J. Fryer's large new Motor Garage at Leominster.

The event is to be held in August next, and the amount to be devoted to prizes will not be less than £1,000.

### French Competitors in International Events.

With the view of protecting the interests of French motor-car builders, the Committee of the A.C.F. has decided that the rules and regulations of all automobile contests organised by foreign countries shall be examined by the competitions committee, and a notice issued by the club to the trade that such contest has been found to be in order and is approved, or otherwise. One condition of the approval is that the automobile club organising the event shall permit the A.C.F. to appoint a representative, who, while not having the right to vote, shall look after the interests of the French entries. The right to appoint a representative in connection with contests held by the A.C.F. will in return be extended to all recognised national clubs.

### Motoring Over the Simplon Pass.

The Simplon Pass over the Alps has at last been opened to motorists, and the Swiss authorities have made the following regulations for such traffic:—June and September.—The pass

### An Italian Hill Climbing Competition.

The Automobile Club of Florence is organising a hill-climbing competition over a fifteen kilometre course on the Pontassieva-Consuma road for the 22nd July. There will be classes for (1) cars from 650 to 1,000 kilogs.; (2) light cars from 400 to 650 kilogs.; (3) Voiturettes from 250 to 400 kilogs. and (4) motor-cycles.

### Miscellaneous.

An automobile club has just been formed at Agram, Bohemia.—Attributing his defeat at the last French elections to the frequent break-downs of his motor-car, a candidate has brought an action against a Paris motor manufacturer, and claims £400 damages.—Fourteen entries have so far been received for the Circuit des Ardennes; they comprise four each Panhard and Mercedes, and three each Darracq and Gregoire.—It has been definitely decided to postpone the Circuit European until next year.—The "Auto" proposes to hold an international competition of industrial vehicles in March, 1907.—It has been decided that this year's race for the Florio Cup shall be held on September 2nd, on the Brescia-Castiglione-Lonair-Brescia Circuit.

# The Herkomer Trophy Touring Contest.

IT might have been thought that, with a flying start three mile race on a level alone to do, there would be nothing very dramatic at the finish of the second international competition for the Herkomer trophy; but the event proved otherwise, for when the small cars came to be run down the course it was found that if the 90-h.p. Mercedes racer was to win against the 18-20-h.p. Horch on the handicap the former would have to travel at a speed of about 300 kilometres, or nearly 190 miles an hour. As for the legitimate touring cars, such as the 45-h.p. Daimlers, the handicap expected them to run at about 160 to 170 miles an hour each. Truth to tell, the officials of the Club were more dismayed at the appalling discovery that the competition had been rendered a *fiasco* than the competitors themselves were annoyed at the

of last week, the order of the first eleven being as follows:—1, Dr. Rudolf Stoss, 18-20-h.p. Horch; 2, Emil Neumaier, 40-h.p. Benz; 3, Willy Poge, 60-h.p. Mercedes; 4, Heinrich Opel, 22-h.p. Opel-Darracq; 5, K. Neumaier, 40-h.p. Benz; 6, Weingand, 70-h.p. Mercedes; 7, T. Dreher, 90-h.p. Mercedes; 8, G. H. W. Uren, 20-h.p. Priamus; 9, A. Horch, 40-h.p. Horch; 10, A. Grigg, 35-h.p. Daimler; 11, Mrs. Manville, 35-h.p. Daimler.

The Herkomer Trophy thus passes from Herr Ladenburg to Dr. Stoss, while the others mentioned above will receive commemorative plaques. Mrs. Manville was, in addition, given a special prize, which took the form of a solid silver highly ornate vase partly worked in silver gilt. Gold medals were also awarded to the following competitors:—Spitzner, 60-h.p. De Dietrich; Lord Montagu of Beaulieu,

The Speed Trials in the Forstenrieder Park, Munich.

revelation. How such a handicap can possibly have been drawn out is hard to tell, because from the facts available in the way of previously published data the impression had got abroad that the allowance was appreciably in favour of the high-powered cars. It has since been learned that in place of drawing up the curve for the speed formula by actually taking cars of various types over the course, the work had been entrusted to a professor of mathematics, who was evidently good at theorising but hopeless at realising, hence the task already outlined. In the circumstances, comparatively little interest attaches to the results achieved in the tests. Therefore it will suffice to record that on the handicap the three best performances in the Forstenreider Park were made by Dr. Rudolf Stoss's 18-20-h.p. Horch, by Herr Carl Westphal's 16-18-h.p. Ge'main, and by Herr Georg Betzin's 18-20-h.p. Horch, in the order named.

The result of the contest was made known on Wednesday

45-h.p. Daimler; Von Reinhardt, 60-80-h.p. Metallurgique; Tischbein, 60-h.p. Benz; Dahmen, 60-h.p. Benz; Schmitz, 50-h.p. Benz; Haase, 40-h.p. Adler; Hesselberger, 60-h.p. Leon Bollee; Marchal, 35-45-h.p. Renault; Brauda, 30-40-h.p. Darracq; Mathis, 40-h.p. Fiat; Prince Henry of Prussia, 40-h.p. Benz; Roth, 40-h.p. Benz; B. Flinsch, 45-h.p. Mercedes; Dreher, 45-h.p. Mercedes; Weiss, 40-h.p. Benz; Jurgens, 28-h.p. Benz; Aschoff, 40-h.p. Metallurgique; Count Arco, 28-32-h.p. Mercedes; Comerell, 28-32-h.p. Mercedes; Kaldi, 28-h.p. Benz; Wandesleben, 24-h.p. Adler; Frankenberg 20-h.p. Clement-Bayard.

Out of the 133 cars which started from Frankfort, 97, or about 73 per cent., completed the whole trial under the conditions laid down in the rules, including the 16-20-h.p. Argyl driven by Mr. Robertson-Grant, whose vehicle, while it did not succeed in getting among the prize winners, made an excellent

showing. The winning car is the product of Messrs. A. Horch and Co., of Zwickau, and it is noteworthy that not only did the three vehicles entered by this firm survive the difficult contest, but all distinguished themselves, Dr. Stöss's 18-20-h.p. machine securing the first place in the Forstenrieder Park speed trials, and in the general classification, Herr Horch's 35-40-h.p. the ninth place in the latter, and Herr Betzin's 18-20-h.p. the third position at the Forstenrieder Park.

In reviewing the second annual motor-car competition organised for private owners for the Herkomer Trophy, the subject resolves itself into a number of points, some of them to be pondered, but the bulk mere reflections of an entirely pleasant sort. The barefaced manner in which the regulations with regard to the coachwork of the competing cars were flouted is one of the most regrettable parts of a competition initiated by a distinguished artist, whose whole and sole aim is to encourage the production of the most desirable and eminently legitimate design of horseless carriages for private use. It is no exaggeration to say that no self-respecting citizen of any of the chief countries of Europe would be seen riding along in such unfinished productions as nearly half of those that were run in the contest. There is a difference between awarding marks for body work and remaining practically indifferent to the subject. For instance, as the competition is designed wholly for private

call one of his fellows to make some repairs to vital parts of the mechanism under his instructions, while he posed as a controller making due note of the same. Again, in the timed hill climb those competitors who did not carry four persons in all had to carry sandbags each to represent a person not carried. These were put on board at the starting line, but no examination took place subsequently. It is somewhat interesting to note that some of these sandbags were found cast on the roadside on the Semmering Pass, within comparatively a short stage, but just out of sight of, the timekeeper's box. Even in lesser matters it was observed right from the outset that no two controllers acted alike, and that few of them seemed to know anything about the rules. It is not easy to know exactly how to help the committee out of the difficulty in this matter. It would appear that the best way would be to issue no rules whatever to the Observers, but merely to instruct them to make note of all that happens and keep them in entire ignorance as to whether the stoppages or incidents involve penalisation or not. Apart from these matters the competition has been fruitful of a store of pleasant incidents that will be happy memories for years to come. Throughout it all one felt the genial and gentlemanly influence of Prince Henry of Prussia. Not only did he do his own tyre pumping and replenishing, but also found any amount of time to look after other people. In particular he was unfailing in his attentions

Mrs. Manville on the Brenner Pass.

owners as against professional motormen, a committee should have laid down the rule that, though no marks could be gained by bodywork, by whatever degree the *carrosserie* failed of being handsome and comfortable it should be docked in marks. The adoption of a policy like this would entirely have frustrated the undesirable action of such entrants as the owner of the 90-h.p. Mercedes racer which, by a mistake by one of the officials, was allowed to run and has actually been awarded seventh place in the competition, though it had only a bent rod as a step to the front seats, while the tonneau was a caricature, the whole having merely had a wash of grey paint. Several other equally flagrant examples might easily be cited, but that one will suffice.

It is understood that next year any car that emits vapours or ill odour, or which is noisy, will be penalised accordingly, and this is essential if the aim of the donor of the trophy is to be kept in view, and a legitimate type of touring car is to be encouraged. Lastly, we come to the most regrettable feature of all, and one over which the committee have practically no control. We refer to the conduct of the honorary Observers appointed by the Club, and to the cheating that took place. As examples, it may be mentioned that in the Exhibition Hall at Vienna a mechanic was deliberately seen to go up to a car, take an Observer's badge off an overcoat, pin it on his own arm, and

to the British competitors. Being the only lady competitor Mrs. Manville naturally received a great deal of attention, the committee presenting her at the finish with a superb wreath six feet in diameter and decorated with broad ribbons, one of each of the three national colours of the clubs represented, viz., the German, Bavarian, and the Austrian.

FROM Messrs. Jarrott and Letts comes a neatly got up booklet containing an interesting description of Mr. Charles Jarrott's recent run from London to Monte Carlo on the 40-h.p. Crossley car, together with some illustrations and a map of the route taken from Boulogne.

A COMPANY to be known as the Newman Hydraulic Motor Car Company, Ltd., is being formed in Sydney with a capital of £10,000, to purchase the rights of an Australian invention for propelling by hydraulic pressure motor vehicles of every description, from the very small car to the traction wagon, including motor-buses, with the object of selling or otherwise dealing with such rights in London. The invention is said to entirely do away with the present inefficient transmission mechanism, comprising the clutch, shafts and change-speed gears, and substitutes an hydraulic piston gear of extreme simplicity.

## THE A.C.F. GRAND PRIX RACE.

THE great event of the coming week is the Grand Prix race organised by the Automobile Club de France in substitution of the Gordon Bennett contest. The discussion which led to the change has already been detailed in these columns, so that it need only be stated that the main object of the A.C.F. in bringing about the new contest was to secure for French manufacturers an opportunity of a larger participation in the race than was possible in the Cupevent, it being considered that they were entitled to this by reason of the importance of the motor-car

industry in France as compared with other countries. From the appended list of thirty-four entries it will be seen that as a result of the change the international character of the race has been considerably reduced, for while six countries were represented in the 1905 Gordon Bennett, only three are participating in the Grand Prix, three German and six Italian cars being ranged against a formidable phalanx of twenty-five French vehicles. The countries which have abstained from the new race are Great Britain, Austria and America.

Contrary to expectations, none of the competing cars will be provided with six-cylinder motors, all being of the conventional four-cylinder vertical type. It is also noteworthy that magneto ignition will be employed on every car. We have already illustrated a number of the vehicles which are taking part in the contest, and this week we are able to reproduce photographs of the Gregoire and Vulpes racers which will be seen at Le Mans next week.

This is the first time the Gregoire firm have taken part in

such an important event and the behaviour of their two vehicles will be watched with interest, especially as they are the lowest powered of all the competing machines. As will be seen, they are extremely low built. The four-cylinder engines, which are rated at 70-h.p., are 140 mm. bore by 130 mm. stroke, the normal speed being 1,200 revolutions per minute. The valves are located in the cylinder heads and are operated by tappets. Ignition is by high-tension magneto and the water-circulation is by thermo-syphon, no pump being employed. The clutch is of the leather-faced cone type and the transmission is by a cardan shaft and bevel gear. Ball bearings are used throughout and shock absorbers are fitted in connection with the springs. Another new comer is the Vulpes Company, whose car is on exceedingly novel lines. As will be observed from the illustration on page 373, which shows the vehicle without its bonnet, it is provided with a four-cylinder engine 180 mm. bore by 160 mm. stroke, the transmission being by side chains. The suspension of the car is quite a new departure, the frame being below the wheel centres. The arrangement is known as the Stabilia, and is claimed to increase the stability of the vehicle and to enable the use of large diameter wheels without raising the centre of gravity.

The race, which takes place on Tuesday and Wednesday next, is being held on what is known as the Sarthe circuit, which measures 103.11 kilometres, or approximately 64½ miles. This has to be covered altogether twelve times by the competitors, six on each of the two days. The circuit is within three hours

Map of the Sarthe Circuit, on which the Race for the A.C.F. Grand Prix is to be held.

of Paris, and conveniently located as regards access by rail; it is in the form of a fairly regular triangle, one of the apices being situated about five miles outside the town of Le Mans. From this point the road goes in one direction to La Ferté-Bernard, and in the other to St. Calais. The course is made up almost entirely of straight stretches, with a road offering an excellent surface, and presenting occasional gradients that can hardly have any appreciable effect upon the speed of the machines. It has been decided that the circuit shall be covered in such a way that the turns will be to the left; the start will take place at Pont de Gennes, the route then being La Fourche, Bouloire, Saint Calais, and La Ferté-Bernard. In order to avoid the narrow streets of St. Calais, a road has been formed across some fields by laying down planks, over which the competitors will have to steer their cars. The road over the whole length of the circuit has been tarred with the view of keeping down the dust. Close upon 7,000 soldiers will be employed in guarding the course on each day of the race. Grandstands have been erected at a number of places on the course, the French and Sarthe Automobile Clubs having each a large one at Pont de Gennes, the starting point. After being closed for several weeks the circuit was once more opened on Wednesday to the racing cars, since when the

competitors have been busy practising in order to become accustomed to the corners.

The thirty-four competitors will be despatched on the first day at one and a half minute intervals in the order shown in the appended table:—

No.	Driver.	Car.	No.	Driver.	Car.
A1	Gabriel	De Dietrich.	B5	Barillier	Brasier.
2	Lancia	Fiat.	6	Mariaux	Mercedes.
3	Siez	Renault.	8	Fabry	Itala.
4	Hemery	Darracq.	9	De Bosch	Gregoire.
5	Baras	Brasier.	10	Heath	Panhard.
6	Jenatzy	Mercedes.	12	Salleron	Hotchkiss.
7	Rigolly	Gobron.	13	Villemain	Clement-Bayard.
8	Itala	Cagno.	C1	Duray	De Dietrich.
9	Gregoire	Tavernaux.	2	Weilschott	Fiat.
10	Teste	Panhard.	3	Richez	Renault.
11	Barriaux	Vulpes.	4	Hanriot	Darracq.
12	Le Blon	Hotchkiss.	5	X.	Brasier.
13	A. Clement	Clement-Bayard.	6	Florio	Mercedes.
B1	Rougier	De Dietrich.	8	De Caters	Itala.
2	Nazzaro	Fiat.	10	Tart	Panhard.
3	Edmond	Renault.	12	Shepherd	Hotchkiss.
4	Wagner	Darracq.	13	De la Touloubre	Clement-B.

Each competitor will be allowed to have two men at the starting point for the purpose of turning the engine starting handle. At the end of the first day's run the cars will be locked up in separate compartments, and access to them will not be permitted until the starting time on the second day, the time occupied in filling up with fuel and water counting in the running time. All work of this kind, as also all repairs, must be effected by the driver and mechanic. All cars finishing four hours after the leading one on the first day will not be allowed to start on the second half of the race, in which the surviving contestants will be despatched at the same intervals as those at which they finished on the first day. One of the rules provides that the competitors shall be permitted to change the drivers if desired on the second day. The weighing operation is fixed for Sunday next, the 24th inst.

Visitors to the circuit needing assistance of any sort should apply to the Secretary of the Automobile Club de la Sarthe, 7, Boulevard Rene-Levasseur, Le Mans. All the local arrangements have been carried out by this club, which has also published a handy little guide to the Sarthe district. It gives a list of hotels and restaurants in Le Mans, a map of the Circuit, and a route map from Paris to the Sarthe. The booklet should be found useful to all who propose to visit France for the event.

Le Mans, which is practically the headquarters of the circuit, is about 210 kilometres (130 miles) from Paris. The following route thereto from the French capital may prove useful to any motorist contemplating a visit to the district:—

	Kil.	Kil.		Kil.	Kil.
Paris ...	...	...	Chartres ...	8	86.
Suresnes ...	4	4	Courville ...	19	105.
Ville d'Avray ...	7	11	Champrond ...	13	118.
Versailles ...	5	16	Montlaudon ...	5	123.
La Miniere ...	5	21	Margon ...	17	140.
Dampierre ...	13	34	Aveze ...	19	159.
Les Cascades ...	6	40	La Ferté-Bernard ...	5	164.
Rambouillet ...	10	50	Sceaux ...	11	175.
Orphin ...	10	60	Connerre ...	9	184.
Gallardon ...	8	68	Saint Mars ...	10	194.
Coltainville ...	10	78	Le Mans ...	15	209.

With the object of helping touring motorists with really efficient tyre repairers, Messrs. Harvey Frost and Co., Ltd., have issued enamel signs to all such repairers for exhibiting or hanging outside their business premises. The sign is only issued to repairers who have satisfied the firm with their capabilities as repairers by the H. F. vulcanising process. None but fully qualified men will be able to get a sign, so that the motorist halting at a repairer's with such a sign over his premises should get any tyre repair satisfactorily carried out. No doubt the motoring public will appreciate it by keeping the sign in mind whenever a tyre demands urgent attention, either whilst a car is in use or in the matter of general upkeep required by resident motorists in the same locality.

A MOTOR fire escape, the first of its kind in the metropolis, has just been added to the London Fire Brigade equipment.

THE County Council of Kinross intends to ask for the scheduling of Milnathort and all the villages in that county for a speed of ten miles an hour for motor-cars.

THE accompanying illustration depicts one of six special vans the London and North Western Railway Company have lately put in service to deal with the motor-car traffic. The vehicles, which were built at the Wolverton Works, are 27 ft. long by 8 ft. wide; they have double folding doors at each end, giving an opening the full width of the inside of the truck. Also, on each side at centre, there are sliding doors with 5 ft. clear opening, so that after loading the cars these doors are available to complete the security. The framing of the body

of the truck is in oak and teak, and panelled outside with planished steel plates. Over the tops of these panels and under the cornice are glass framed lights, which give a good light to the interior. The underframe, which is made of steel throughout, is mounted on two pairs of wheels of standard pattern.

FOUR-AND-A-HALF miles of new roads have been constructed on the Garden City estate in Hitchin.

THE Colonial Office is watching the results of some experiments that are being made in Northern Nigeria as to the possibility of employing motor traction there.

MESSRS. PRESTON AND CO., LTD., of Great Brunswick Street, Dublin, have recently erected fireproof stores in connection with their business in motor spirit, of which they claim to be the largest direct importers in Ireland.

ARRANGEMENTS have been completed for the "Henry Edmunds" hill-climbing trophy race, which will be held on the 14th prox. at Blackdown Park, Fernhurst, Sussex. This year the trophy will be awarded to the car making the best aggregate time for three runs up the hill.

THE Lancashire Farmers' Association, at Preston, on Saturday, adopted a resolution stating that considering the damage done to roads by motor-car traffic and the heavy expenditure entailed to meet the requirement of the traffic and the nuisance and annoyance to all others who use the roads, the Association is of opinion that a £20 licence per annum on motor-cars would not be too much.

MESSRS. SHIPPEY BROS., of King Street, London, E.C., have been appointed British agents for the Logan cars built by the Logan Construction Company of Chillicothe, Ohio, U.S.A. Both pleasure and industrial vehicles are being made, the former comprising a 10-h.p. runabout and 20-h.p. and 30-h.p. touring cars, and the latter a 10-h.p. 20 cwt. delivery van, a 30-h.p. 2-ton lorry and a 30-h.p. twenty-seated public service car. The engines fitted to these vehicles are of the opposed double-cylinder horizontal type, the 10-h.p. being air-cooled by means of a fan mounted on the crank shaft and the 20-h.p. and 30-h.p. water cooled. The change-speed gear is of the sliding pinion type, and the drive by a single centrally-located chain on to a live axle.

## HERE AND THERE.

THE Society of Automobile Mechanic Drivers has removed its headquarters to Rawlings' Garage, Halkin Street, Belgrave Square, London, S.W.

WE learn that Les Usines Prunel have secured a contract

for twenty of their Prunel motor-omnibus chassis for Alexandria, Egypt.

THE Bishop of Ripon has been elected a member of the Automobile Club.

AN order for three Critchley-Norris motor-buses has just been placed by the Rossendale Carriage Company, of Bacup.

THE Yorkshire Steam Wagon Co. have secured an order for two steam wagons for the Corporation of Richmond, Surrey.

SOME Free Church ministers from London have recently been combining a motor-car tour with a preaching mission in Devon and Somerset.

THE excellent behaviour of Palmer Cord Tyres in the Frome's Hill Speed Trials and the London to Edinburgh run was a notable feature of both events.

AT Maidenhead, on Wednesday last week, the Berks magistrates imposed penalties amounting in all to £108 on motorists for driving their cars at an excessive speed.

MR. L. H. BARNES, secretary of the Highways Protection League, says that last month 326 people were summoned for offences against the Motor Car Act, and that 275 were convicted. The odd 51 may consider themselves fortunate.

THE Masham Urban District Council intends to ask the North Riding (Yorks) County Council to obtain an order prohibiting the use of motor-cars on several roads within the area of its jurisdiction which are less than 16 ft. in width.

THE Coventry Motor Fittings Co. are having a new factory built on lines suitable to the requirements of their business. For some time past they have had considerable difficulty in coping with orders for want of room, and their new premises, when finished in September, will be three times as large as the old factory, with ample provision for further extensions.

A View of Messrs. W. & F. Thorn's Factory in Little Portland Street, W., after the Fire on Wednesday last week.

Messrs. Thorn inform us there will be no delay in carrying out orders, owing to their having several large factories in various parts of London, fitted up with modern machinery, plant and materials, also a large staff of highly skilled mechanics, most of whom have been in their employ for many years. Their large stock of seasoned timber is stored at Haggerston, and was consequently unaffected by the fire.

THE New Arrol-Johnston Company, Limited, has recently supplied a 12-15-h.p. chassis to the order of its sole agents for Northumberland and Durham, Messrs. Sanderson and Sanderson, Newcastle-on-Tyne, who have equipped it with a special body for use by a wholesale drapery firm, to carry loads up to 15 cwt. at speeds up to twenty miles per hour.

## CORRESPONDENCE

[Letters to the Editor should be addressed to the offices,  
27-33, Charing Cross Road, W.C.]

### STEAM CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have watched with interest for the replies to Mr. Martin's query re steam cars in the *M.C.J.* of June 2. Both Stanley and Locomobile steam cars are quite rightly commended for their good qualities for steaming, both on the level but more especially up hills, which is their strong point. For some years I have taken in the "English Mechanic," and, since I have become a motorist, I have also taken in the *Motor-Car Journal*. In passing, I must thank the Editors of these able papers for holding the scales of justice so evenly between the advocates of steam v. petrol. I conclude, from the various notes, queries and answers in these two papers, that on the whole pound for pound spent on either of these rival systems the steam cars give a better horse-power and less trouble all round than the petrol cars.

One of the objections named against steam cars is the time it takes to get up steam. Until quite recently it took the Gardner-Serpollet vehicle about six minutes to get under way, but just lately the

with four up. The grade is given as 1 in 3½ in the steepest part. In all official hill climbs in England in which the Serpollet cars were allowed to compete, they, of course, won easily, defeating petrol cars of six times their power. The hill mentioned above no petrol car has as yet, I believe, climbed, even on its low gear. A few weeks ago a well-known firm of petrol car makers "found" a hill in Kent of a reputed grade of 1 in 4 in parts. One of their 20-h.p. cars, on a low gear, succeeded in climbing this, which was, of course, no more than it should have done. A client wrote me that for several years he had gone up this hill on his old 6-h.p. Serpollet, carrying four passengers, and only regarded it as a stiff climb. On short grades Serpollet cars do not do so well, as there is not time to adjust the working pressure before the hill is surmounted; but on long, steep hills the speed gradually increases till it practically equals speed on level. I have from a standing start driven a 9-h.p. new type Serpollet up a short incline of 1 in 3½ without trouble."

I think the above is a good set-off against the wonderful performances (!) by petrol cars which have been chronicled in the papers just recently. Please excuse my being so late with my letter, but I am staying in the Austrian Tyrol at present.—Your truly,

J. H. BROOKES-SMITH.

### SMELL AND SMOKE FROM MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice in the issue of the *M.C.J.* of the 9th inst. that "Bored" makes a somewhat sweeping assertion regarding the possibility of using paraffin for the lubrication of petrol motors. Now I have been experimenting for some time with paraffin for cylinder

Mr. C. Jarrott on the 60-h.p. De Dietrich.

Mr. H. Luff-Smith on the 5-h.p. Wolseley.

Photos by]

THE MIDLAND CLUB'S HILL CLIMB AT SHELSEY WALSH. (See page 380.)

[Mr. H. Luff-Smith.

agent for these cars mentioned that steam can now be raised in about three minutes. Query, Do all petrol cars get off in that time? Not only that, but one does not in the case of a steamer require to make acquaintance with that hind leg of a mule, the starting handle.

For Mr. Martin's benefit, if I may do so, I should like to quote part of a letter by Mr. D. J. Smith to the "E. M." of April 27th, in which he says:—"For a light runabout the Stanley has much to recommend it. Its water range is only 35 to 40 miles, and it burns petrol; but it is a very handy little car, light on tyres, and makes a good average. The direct drive on the rear axle is a great point, the only objection being the flexible steam pipe, and the fact that should anything go wrong with the engine the car cannot be wheeled. Last, but not least; if Mr. Martin goes in for a second-hand steamer, the chances are in favour of his having to spend much less on it than if he goes in for a petrol car, as on a steamer there is less to get out of order. If, however, Mr. Martin should wish to carry more than two persons, I think it would be worth his while to try a Gardner-Serpollet steam car; in any case he might get Mr. G. H. Oliver's "Note on the Management of the Gardner-Serpollet steam car."

With your kind permission, and if space permits, I should like to quote a further paragraph by Mr. D. J. Smith in the "E. M." of June 1st, which will give Mr. Martin a good idea of the tremendous power (there is no other expression for it) of the steam car, and it will also explain why petrolists do not care to have steam competitors in hill climbing competitions, or, in fact, in any competition. Mr. Smith says:—"Serpollet cars are such exceptional hill-climbers, and have scored so many successes, that it is hard to say what is the steepest grade that one of these cars has climbed. There is a hill on a by-road not far from Dorking, up which a 10-h.p. Serpollet car was driven at nearly fourteen miles per hour

lubrication in a small horizontal petrol motor, and find that by using from 25 to 30 per cent. of paraffin in the petrol it lubricates the piston and cylinder walls thoroughly. The motor I used was water cooled, and has low compression, about 65 lbs. per square inch. What takes place is this. Owing to the low compression, only the lighter and volatile constituents of the paraffin are vaporised and fired, the heavy mineral oil portion being deposited on the cylinder walls. Of course it would be scarcely possible to lubricate the crank shaft bearings in this way, as sufficient oil would not be likely to find its way past the piston rings to the crank case unless the rings were in bad condition.—Yours truly,

THOMAS W. P. HANNAM.

### UNFAIR POLICE TRAP

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—May I call attention to the unfair methods of trapping motorists in Leeds? On June 3rd, Sunday, I was motoring from Harrogate to Sheffield, and at six o'clock was stopped by a policeman on the Chapeltown Road leading into Leeds. I was informed that I had done 220 yards in 18 seconds, or at the rate of 25 miles per hour, and should be reported. I was not travelling at the speed alleged, the road was wide, there was only a milk cart in view at the time, very few people about, it being tea time, and I had just put on my side brake as I had struck a hill and did not know how steep or how long it was. The usual cheap stop-watch was produced in court, and, although the case was ably defended, I was fined £1 and costs 10s. In all the matter cost me £5. I am not grumbling at the price, but that

any Chief Constable in England should allow his underlings to measure, on their own responsibility, distances of 200 yards and to persecute motorists.

In the south of England many traps have been rendered null and void by the cyclist corps giving warning. I should like to suggest that notice boards be fixed on the main roads into Leeds by the local club, warning motorists to drive slowly. To measure short distances like 220 yards on the beginning of a down grade is most decidedly unfair. A stranger will always be caught before he has realised the descent and got his brake fixed. The way to checkmate this police game is to post a notice that can easily be read by motorists wherever a measured distance is known to exist, and this could easily be done by the local automobile clubs, or a sign would be sufficient.—Yours truly,

C. D. L.

### GOVERNOR POSITION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was pleased to notice in this week's issue of the *M.C.J.* a criticism of the position of the governor on our new car, as it gives us the opportunity of pointing out that adjustment is provided for keeping the belt taut, although we find this is hardly ever required, owing to the special belt which we fit. Apart from this fact there is no reason why a belt should not give just as good results in driving a governor as any other contrivance; in fact, most high-speed governors are driven by belts.

As the fan spindle runs at a higher speed than any shaft attached to the motor, we are able to use a very light and sensitive governor placed in a position where it can be very easily got at, and where the connections to the throttle are simple and direct. Many of your readers will, we feel sure, be able to appreciate these points.—Yours truly,

H. AUSTIN.

### DETAINED BY THE POLICE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The conduct of the St. Neots Bench and the local police towards motorists has been so oppressive that some of your readers may be interested to know that I am instituting proceedings against certain of the police there for detaining me because, after conviction, I failed to produce my licence immediately. I shall be much obliged if anyone who has suffered similar treatment will communicate with me, at 30, Burton Road, Brondesbury, N.W., or my solicitors, Messrs. Kenneth Brown and Co., 11, Pancras Lane, London, E.C. Your kind insertion of this letter in your valuable paper will be greatly esteemed by—Yours truly,

ARCHIBALD CANTY

### THE AUTOMOBILE ASSOCIATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—May I enlist your valuable aid in order to inform automobilists that we intend to protect the Great North Road to Scotland during the shooting season with our well-known cyclist patrols? It is quite a formidable undertaking, and how long the protection can last is entirely dependent upon the financial support we obtain from motor-car owners, who are invited to write at once to our offices at 18, Fleet Street, E.C., when, in return for a remittance of £2 7s., the car badge and fullest particulars shall at once be sent.—Yours truly,

STENSON COOKE.

### CHARGING ACCUMULATORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have an electric lighting plant from which I should like to be able to charge my 15 ampere-hour ignition accumulator. The installation consists of 150 lamps of 16-c.p. at 100 volts continuous current. The lamps are grouped in sets of ten, i.e., one switch controls ten lamps, and I also have at intervals wall sockets for connecting up extra lamps as required. Should I be safe in taking current from one of these wall sockets to charge my accumulator? Any information you or any readers of the *M.C.J.* can give me on the subject will be greatly appreciated.—Yours truly,

F. R. RANSOME.

[It is an easy matter to charge a 15 ampere-hour accumulator from a 100 volt installation, but on no account should the attempt be made to do so from a wall socket, as this would result in connecting 100 volts on to the accumulator, which would probably destroy it in a few moments. All that is necessary is to obtain what is known as a charging adaptor from an electrical firm, and use this from one of the electric lights. A charging adaptor is simply an ordinary lamp holder with a flexible cord attached to it in such a manner that one can charge an accumulator in series with an incandescent lamp. The lamp should be removed from one of the pendant fittings (inserting the charging adaptor in its place, which it is made to fit), the lamp being put into the holder which is provided in the adaptor. A flexible cord is fixed in the holder, and after testing the two ends of this with pole-finding paper to ascertain which is the + wire, the accumulator should be connected up, taking care to connect the wire from the adaptor to the terminal of the

accumulator. The accumulator is charged by the current passing through the lamp and then through the accumulator, the lamp acting as a resistance and preventing too much current flowing through the accumulator.]

### TROUBLE WITH DE DION ENGINE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to "CR 328," I think the cause of his engine refusing to start easily is due to either (1) incorrect adjustment of the platinum points on contact breaker, or (2) a "short" occurring through the aluminium cover of contact breaker.

In regard to (1) he should see that the points are clean, meet square to each other at the "make," and that the "buzz" when testing trembler by hand is correct, i.e., the note should be like that of a Jew's harp. Also that the trembler lies exactly half-way in the notch in the cam. As regards (2) he should test the spark at the plug, with contact breaker cover removed, and also with it screwed up properly. In either case a stream of sparks, from two to five, should occur at the plug when turning the starting handle slowly, every time contact is made.

I have completely cured a troublesome "short" on my cover by fitting a new vulcanite plate. If he will write to me at Eastwick Rectory, Harlow, Essex, I shall be pleased to give him more detailed instructions than possible in this letter, as I have had considerable experience with De Dion ignition, and I can always start my own 8-h.p. De Dion at from one to three pulls on the handle, without winding, when correctly adjusted.—Yours truly,

(Revd.) GEORGE ROWLEY.

A Motor Car Wedding at Lowestoft.

Mr. W. G. Fuller, motor engineer, Kirkley, was recently married at St. Margaret's Church, Lowestoft, to Miss Hayward. The bridal party went to and from church on motor cars supplied by Mr. W. R. Youngs and Mr. W. H. Smith. As this was the first motor wedding in the town it attracted considerable attention.

### CLEANING RADIATORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Can you or any reader of the *M.C.J.* advise me as to the proportion of sulphuric acid that should be used with water for washing out furred-up radiators, and how long should the solution be left in the radiators without damaging the pipes? If there is any other way of cleaning radiators than by the use of acid, I should be glad of information.—Yours truly,

J. TRIBE.

[We should advise our correspondent in the first place to try a strong solution of soda and water to clean the radiator, letting this stand all night. This would not have any ill effect on the metal. If this treatment is not found effective, a solution of sulphuric acid in the proportion of twenty parts water to eight of acid may be tried. As to the length of time, this depends entirely upon the amount of fur which has to be removed. If very bad, a somewhat stronger solution may be used, but this would have to be carefully watched. It will also be necessary to thoroughly wash out afterwards, the best way to do this being to allow clean water to run through for a short time.]

THE SCOWEN CHANGE-SPEED GEAR.—R. J. W. writes:—"Will any reader of the *M.C.J.* who has had this gear fitted to his cars inform me how it works in practice?"

THE DUBRULLE LUBRICATOR.—"Oiler" writes:—"The car I am in charge of has a Dubrulle mechanical lubricator which has gone wrong. Could any of your readers inform me if I can have the same repaired in London or shall I have to send it to France?"

## THE IRISH AUTOMOBILE RELIABILITY TRIALS.

THE first series of reliability runs and hill-climbing contests promoted by the Irish Automobile Club was carried to a successful issue last week. The programme consisted of a three days' reliability run of one hundred miles over an out-and-home course, starting and finishing each day at the club's headquarters in Dublin, and a hill-climbing contest on the fourth day. The competition was divided into two sections, the first confined to members of the club and private owners resident in Ireland, the cars so entered to be the bona fide property of the entrant, to be driven by the owner or a member of his family. Section 2 was open to those qualified for Section 1, and also to motorists connected with the trade. The competition was sub-divided into classes according to the selling price of the car, and certificates will be awarded to cars in each class which fulfil the required conditions of both reliability tests and hill-climbing contest. A gold medal is awarded for the best performance in each class.

The following took part in the contests:—G. M. Meares 16-20-h.p. Reeston Humber; W. A. Heaven, 10-h.p. Cadillac; T. Henshaw, 28-h.p. Daimler; Harvey Du Cros, junior, 20-30-h.p. Austin; W. Naismith, 16-20-h.p. Argyll; Argylls Limited, 10-12-h.p. Argyll; E. C. Herdman, 20-30-h.p. Darracq; G. Swift, 16-24-h.p. Prosper Lambert; T. C. Pullinger, 16-20-h.p. Beeston Humber; T. L. Plunkett, 28-h.p. Daimler; Miss E. Massy Wheeler, 8-h.p. Rover; R. W. Morris, 40-h.p. Ariel Simplex; Captain E. Lindsay Knox, 22-h.p. Orleans; C. Moore, 40-h.p. De Dietrich; T. W. Murphy, 6-h.p. Rover;

speed during the two preceding days had to change before reaching Gorey. Miss E. Massy Wheeler, the only lady taking part in the contest, reported one stop on the return journey, the first she had experienced for the three days. Several others were equally as unfortunate on the Friday, Mr. Godwin Swift, who was driving a Prosper-Lambert, not being able to resume the return journey within the schedule time. The Argyll driven by Mr. Naismith lost two marks through sparking-plug and carburettor troubles, and the Vinot and Globe had one stop each. Both Messrs. E. C. Herdman (Darracq) and Plunkett (Daimler) lost marks before leaving the garage on the outward journey in the morning. The arrangements in connection with the reliability runs both at the club headquarters along the routes and at the control were of a very elaborate description, and reflect much credit on the thoughtfulness and consideration of the committee in their endeavour to cater for the convenience and comfort of the competitors, observers and other officials. Special mention should be made of the valuable assistance rendered by Messrs. Hum Bland, C. Seagrave, E. White, hon. sec., and Mr. Chaytor, secretary.

A hill-climbing contest for competing cars in the reliability tests was held on Saturday. The venue was Callow Hill, Newtownmountkennedy, co. Wicklow, some eighteen or twenty miles from Dublin. Thirty cars took part in the contest, including several that did not enter for the reliability tests.

The fastest time recorded during the contest was credited to the 22-h.p. Minerva, which got over the distance in 2 min. 21 4-5 sec. with Mr. J. C. Moore Brabazon at the wheel. The local arrangements in connection with the hill climb were in the hands of Messrs. Hum

Sir W. G. Goff starting on his 20-h.p. Clement.

Colonel R. Chancellor Knox, 20-h.p. Orleans; W. D. Sainsbury, 16-20-h.p. Argyll; J. B. Dunlop, 16-20-h.p. Humber; J. T. Moore Brabazon, 22-h.p. Minerva; S. T. Robinson, 20-24-h.p. Clement Talbot; Chambers and Co., 8 h.p. Chambers; T. J. Watters, 16-20-h.p. Vinot; J. E. Mills, 20-h.p. Clement Talbot; Turner Bros., 10-12-h.p. Globe; W. F. Peare, 20-h.p. Gladiator; P. Hallinan, 10-h.p. Clement; E. L. O'Brien, 20-h.p. Wolseley; H. Whitworth, 40-h.p. Napier; Sir W. G. Davis Goff, Bart., 20-h.p. Clement; E. M. Stirling, 20-30-h.p. Richard-Brasier.

The first day's run on the 13th inst., to Carlow and back, 99½ miles, was favoured with seasonable weather. Twenty-six out of the twenty-eight starters reached Carlow without a stop, the two exceptions being the 10-h.p. Clement and the 10-h.p. Cadillac. The former had a short circuit in the earth wire and lost half an hour putting it right, while the former put on his clutch too early after running down hill and stopped his engine; both, however, reached Carlow inside schedule time, returning to Dublin after the sixty minutes official stop had expired.

The second day's run to Dundalk and back, 102 miles, was equally uneventful. Several cars experienced some difficulty in negotiating Tullyisker hill, outside Drogheda, both on the outward and homeward journey. Some minor delays occurred on the return to Dublin, the driver of the Cadillac being again delayed for a short period, and the Chambers car stopped through tyre troubles, all the other competitors doing non-stop runs.

The run on the third day, June 15th, from Dublin to Gorey and back, 122 miles, was by far the most trying trip of the series. The route lay through county Wicklow, which abounds with hills, and strange to say many of the powerful cars that ran on the high

Bland and Captain Seagrave. The times were taken by Messrs. Colman and Connell, and Mr. E. White, hon. sec., officiated as starter.

The best times on the hill climb in each class were as follows:—

CLASS A. (Cars costing £200 or under.)			
		Min.	Sec.
Chambers, Ltd.	8-h.p. Chambers	5	52 3-5
CLASS B. (Cars costing over £200, not over £300.)			
J. E. Mills	8-h.p. Clement-Talbot	4	11 2-5
CLASS C. (Cars costing over £300, but not over £400.)			
Colonel C. Knox	20-h.p. Orleans	3	47 3-5
CLASS D. (Cars costing over £400, but not more than £550.)			
J. T. C. Moore-Brabazon	22-h.p. Minerva	2	21 4-5
CLASS E. (Cars costing £550, but not over £700.)			
T. Henshaw	28-h.p. Daimler	2	24

Section III.—Open to members of the club, private owners, and those connected with the trade, not taking part in the reliability tests:—

Sir H. A. Robinson ... 20-h.p. Argyll ... 3 23 2-5

As we go to press we learn that the Goff cup for the best performance in all amateur classes was won by Mr. J. B. Dunlop on his Humber car. Mr. T. Henshaw on the Daimler was second; Colonel Knox on his Orleans third. There was only a difference of 47 between the first two. The announcement is subject to final audit. The Dunlop cups were won by Mr. Ducros on the Austin, Mr. Robinson (Talbot) being second.

## CLUBS AND ASSOCIATIONS.

## MOTOR CYCLING.

In connection with the recent London to Edinburgh twenty-four hours run of the Motor Cycling Club, the following have been awarded the club's gold medal:—Motor-bicycles.—Ashworthy, D. S. Baddeley, L. A. Baddeley, Badenoch, Bailey, Bellinger, Blackney, F. M. Bond, H. M. Bond, R. G. Booth, Brice, Campbell, Drummond, Freeman, Frost, Godfrey, Goslett, Hart, Hulbert, Hull, Jacobs, Mussell, Reynolds, F. Sale, Shutes, Sproston, Jackman, Webb, Wells, Williams, Wright. Tri-cars.—Earp, Gunn, Miss M. Hind, J. Van Hooydonk. Cars.—Platts-Betts, A. J. Brown, C. W. Brown, F. J. Jenkins, Peckham, Price, Sewell, J. W. Stocks, H. Taylor, Miss A. Wood.

In connection with the above run the following completed the return journey in another twenty-four hours in competition for the Schulte Cup, awarded to the competitor who kept nearest schedule time on both journeys: J. W. Stocks (winner of the cup), Bailey, Bellinger, Platts-Betts, C. W. Brown, Godfrey, Hart, Hulbert, Peckham, Reynolds, Williams.

## BLACKHEATH.

THE annual hill climb held on Saturday last resulted in a somewhat small attendance. The hill selected was at Hixey Road, Ightham, the length of the course being 1,377 yards with a total rise of over 341 feet and an average gradient of 1 in 12.09. Cars were weighed with passengers at Sevenoaks "Bat and Ball" Station, and then proceeded to Crown Point Inn, Seal, where tea was partaken of. The competition commenced later, Professor Carlton J. Lambert acting as starter and Mr. Hugh Beadle as timekeeper. About a dozen cars were entered for the competition, the following being the result of four fastest according to formula, subject to confirmation by the judges:—

			M.	S.
1. T. Marshall	...	10-h.p. De Dion Bouton	5	34 4-5
2. L. Beadle	...	8-h.p. Regal	...	6 8
3. W. Whiteway	...	14-h.p. Regal	4	32 4-5
4. E. W. Stabb-Johnson	...	7-h.p. Star	4	33 3-5

Mr. Duckham has kindly promised to increase the value of the challenge cup from five to ten guineas, which is to become the property of the winner if won for three years in succession.

## SOUTH HERTS.

THE South Herts Automobile Club members' hill climb at Newgate Street on the 9th inst. proved a most successful event. The weather was perfect and attracted a large number of motorists from the surrounding districts, who followed the proceedings with evident interest. There were fifteen starters out of seventeen entrants in the motor-cycle class and five out of six cars. The silver medal in the car section was won by Mrs. Price, who drove her 7-h.p. Star splendidly; J. Rochford, 12-h.p. Wolseley, being second, and S. R. Noble, 6-h.p. Rover, third. In the motor-cycle class very good times were made, the winner being F. Sykes, 5-h.p. Rex; C. E. Fell, 2-h.p. Waltham Cross, 2nd; H. W. Speight, 5-h.p. Rex, 3rd; F. W. Foott, 4-h.p. Minerva, 4th; W. E. Hamilton, 5-h.p. Waltham Cross, 5th, and E. M. Ridge, 4-h.p. Givardan, 6th. The following were awarded certificates of merit:—Mrs. Price and S. R. Noble in the car class, and E. M. Ridge, W. E. Hamilton, F. W. Foott, H. C. Walsh, C. K. Trotter and F. Sykes in the motor-cycle class.

## ESSEX.

THE Essex County Automobile Club held a successful gymkhana at Colchester on Saturday, in aid of the funds of the Essex and Colchester Hospital, in an enclosure kindly lent by Col. W. Howard.

There were six competitions, the winners of which were as follows:—

Obstacle Race	...	Mr. Burnett Tabrum.
Ladies' Passenger Race	...	Mr. J. Hossoch.
Tortoise Race	...	Mr. J. Gurney Fowler.
Starting and Stopping Race	...	Mr. F. C. Hill.
Turk's Head and Pig Sticking (open event)	...	Mr. F. C. Hill.
Musical Chairs	...	Mr. W. R. Fasey.

## KENT.

IN spite of the wet weather many members and friends were present at "Hulsewood," Dartford Heath, the residence of Mr. and Mrs. Morgan, on Saturday, when all those who braved the weather were most hospitably entertained. Among the first to arrive were Dr. Firth, the chairman, and Mrs. Firth, then followed Mr. and Mrs. Gardner, Mr. and Mrs. Bailly, Mr. and Mrs. A. S. Hordern, Mr. and Mrs. Batchelor, Mr. Cobham, Mr. and Mrs. Norman, Mr. E. B. Gardner, Mr. and Mrs. Fraser, Mr. Neate and several others, including the hon. sec. and Mrs. Kenyon.

## LEEDS.

By kind permission of the Earl of Harewood, the Leeds Motor Cycle Club will carry out a hill-climbing competition in Harewood Park, near Leeds, to-day (Saturday). Two classes are arranged for, one for motor-cycles, for the Triumph challenge cup and club medal of merit, in gold, and another for any passenger machine with not more than three wheels, for which event a gold medal and certificate is offered, the medal being given by the Rex Motor Manufacturing Company. The event is a purely private one, each member of the club, now 130 strong, will have a pass to enter Lord Harewood's beautiful park, and an enjoyable afternoon is expected. On the 9th inst. a speed judging contest was held on a twenty mile course near Leeds, some twenty-four members competing, each having a different number of minutes allowed to ride the course. The winner of the club medal was found in the president, Mr. James R. Kelly, who rode within 2 min. 5 sec. of his time. The win was greatly appreciated by the club members, who accompanied the president to the Wellington Hotel after the event, a private room being engaged. Some speech-making took place and several medals for other events were promised on the spot.

## MANCHESTER.

THE Manchester Automobile Club held the sixth run of the season on Saturday. Fine weather and a good programme attracted a large number of members. Delamere Forest was the destination, and Vale Royal Abbey was visited *en route*, and a most enjoyable hour was spent in this interesting mansion. It is the seat of Lord Delamere, and contains many fine portraits, including some by Rubens, Sir Peter Lely, and Sir Godfrey Kneller, besides a library of rare and valuable books. Leaving this fair scene, the cars rapidly covered the intervening distance between the Abbey and the depths of the forest, where the *al fresco* repast was made.

The "Heads and Posts" Competition at the Lincolnshire Club's Gymkhana.

## LINCOLNSHIRE.

THE Lincoln members of the Lincolnshire A.C. decided to include a motor gymkhana when entertaining the county members at Lincoln on Saturday in the beautiful grounds of Monk Manor, kindly placed at their disposal by Col. J. S. Ruston, J.P., a prominent member of the club. The Lincoln Volunteer band was again engaged, and played, under Mr. F. George, a very good programme, and for "Musical Chairs." The various events were well contested and, when not amusing, were instructive and interesting. There was a very good attendance, though the weather was bad in the morning. The following are the results:—

BENDING RACE.—1, Dr. W. J. Gilpin, Bourne, 12-h.p. Brasier; 2, Mr. G. E. Sanders, Scampton, 4-h.p. De Dion.

MUSICAL CHAIRS.—1, Dr. Purves and Miss Wray, Lincoln, 6-h.p. De Dion; 2, Mr. G. E. and Miss Sanders.

STARTING AND STOPPING RUN.—1, Dr. Gilpin; 2, Dr. Purves.

OBSTACLE RACE (over balloons).—1, Dr. W. Jagger, Lincoln, 8-9-h.p. Cadillac, 4 balloons, 57 1-5 sec.; 2, Mr. W. J. Newsam, Lincoln, 15-20 h.p. Panhard, 5 balloons, 1 min. 54-5 sec.

HEADS AND POSTS.—1, Dr. de Beauvais, Woodhall Spa, 9-h.p. Oldsmobile, 8 "heads," 1 min. 14 sec.; 2, Dr. W. J. Jagger, 9 "heads," 1 min. 19 sec.

BALLS IN TUBS.—1, Mr. G. E. and Miss Sanders, 6 balls, 1 min. 15 sec.; 2, Dr. V. Smith, Wellingham-by-Stow, 5 balls, 1 min. 15 sec.

Sir H. B. Bacon, the president of the club, is giving a silver challenge cup for the hill-climb at Cawkwell on July 12th.

## MANCHESTER MOTOR CLUB.

THIS club held the second competition of the season on Saturday last on Cheshire roads, being a 100 miles reliability trial for motor-cycles and a speed judgment test of 17 miles an hour combined. The course was a circular one of 18½ miles from Oakmere by way of Delamere, Kelsall, and Tarvin (near Chester), then turn to Tarporley and back to the starting point by way of Cote-

brook. There were 25 entries and 21 competed. Twelve made a non-stop run and qualified for prizes or club certificates. These were Messrs. H. Tipples, P. H. T. Butler, F. Dunderdale, F. W. Newbury, G. Watson, C. E. Kettle, W. T. Munroe, H. Brady, V. E. Grindon, J. T. Ward, P. Nicholas and H. Hurst. The times were worked out later and showed the following result:—1st, J. T. Ward (Bat motor-bicycle); 2nd, H. Hurst (tri-car); 3rd, G. Watson (motor-cycle).

### SHEFFIELD.

THE Sheffield and District Automobile Club held a hill-climbing competition at Grindleford on Saturday last. The course was exactly the same as in previous years, starting just over the bridge at Grindleford, and finishing a little over 100 yards below Fox House. The gradient in one or two places is as much as one in eight, but the average is about one in seventeen. The hardest part of the course is that from just below the farm until after the Maynard Arms has been passed. The competition was divided into three classes, but unfortunately Class No. 2, which was for motor-cycles, had to be omitted on account of insufficient entries. Class No. 1, in which there were eleven entries, was really an open class, as both makers and private owners could compete; whilst Class No. 3 was restricted to private owners only, there being fifteen entries.

The official times as given out by the timekeepers will be found below. It does not, of course, follow that the car doing the quickest time will be the winner, that having to be worked out on a sort of handicap by the formula of the A.C.G.B.I., and will be made known later:—

#### CLASS I.

		M.	S.
Mr. A. Farnell ...	Daimler, 30-h.p.	3	28
Mr. Thomas Nash ...	Mercedes, 18-h.p.	5	15
Mr. Benjamin Hind ...	Clement-Talbot, 12-h.p.	5	25
Mr. C. D. Leng ...	F.I.A.T., 24-h.p.	5	56
Mr. C. D. Leng ...	White, 18-h.p.	6	2
Mr. J. H. Hall ...	Darracq, 20-h.p.	6	12
Mr. F. Churchill ...	Hallamshire, 14-h.p.	6	26
Mr. Jas. Barber ...	Belsize, 10-h.p.	6	43
Mr. F. Gregory ...	F.I.A.T., 16-h.p.	6	43
Mr. A. S. Fawcett ...	Darracq, 15-h.p.	7	46
Mr. F. Churchill ...	Hallamshire, 24-h.p.	15	13

#### CLASS 3.

		M.	S.
Mr. Thomas Nash ...	Mercedes, 16-h.p.	5	14
Mr. C. D. Leng ...	F.I.A.T., 24-h.p.	5	48
Mr. J. H. Hall ...	Darracq, 20-h.p.	6	9
Mr. J. W. Vessey ...	Belsize, 10-h.p.	6	23
Mr. F. Gregory ...	F.I.A.T., 16-h.p.	6	37
Mr. Percy Johnson ...	Clement-Talbot, 12-h.p.	6	59
Mr. A. S. Fawcett ...	Darracq, 15-h.p.	7	43
Mr. W. W. Wood ...	Humber, 10-h.p.	8	13
Dr. Parsons ...	Swift, 12-h.p.	9	17
Mr. W. N. Drew ...	Albion, 16-h.p.	10	13
Mr. H. Beesley ...	Wolseley, 6-h.p.	10	34
Mr. C. D. Leng ...	White, 18-h.p.	11	48
Mr. A. J. Blyde ...	Aster, 7-h.p.	12	33
Dr. Thorne ...	Wolseley, 8-h.p.	13	5

The officials, who are to be highly complimented on the complete success of the venture, were as follows:—Clerks of the course, Messrs. P. J. Benson, E. W. Hatfield, and W. Watts; judge, Mr. E. F. Coupe; starter, Mr. W. Robinson; clerk of the scales, Mr. G. D. Flather; marshal, Mr. Benj. Hind; timekeepers, Messrs. W. E. Cope and T. Lonsdale; handicapper, Mr. J. R. Wade; hon. secretary of the meeting Mr. Fred B. Cawood.

### Huddersfield Branch of Y.A.C.

SOME members of the Committee of the Huddersfield Automobile Club and several competitors who had entered the competition met at the house of Mr. W. Singleton at Wood View, Kirkburton, last week for the purpose of presenting him with the cup offered by the club for the best result out of the three classes of cars in the recent hill-climbing competition. Mr. Singleton was also the winner of the medal for being the best in his particular class, which consisted of two-cylinder cars. There were present, among others, the president (Mr. W. H. Jessop, J.P.), Messrs. W. Singleton, A. Dawson, F. H. Wilson, H. Broadbent, W. Priest, F. Sutcliffe, J. W. Hobson, G. A. B. Lockley, W. H. R. Lockley, Edmund Swallow, and the secretary, Mr. E. G. Learoyd. Mr. Learoyd read the results of the competition, showing that the medals were won in their respective classes by Messrs. W. B. Lawton, W. Singleton and D. Stoner Crowther, and that the cup for the best all round performance was won by Mr. Singleton. Mr. Jessop, the president, then presented the cup and medal to Mr. Singleton, and stated that the latter had commenced his membership of the club in a very satisfactory manner to himself, as he only joined a day or two before the competition took place and succeeded in beating all other members in the trials. After the ceremony was over the members partook of Mr. Singleton's hospitality in his garden, surrounded by most beautiful scenery, and a very pleasant evening was spent.

THE North Yorkshire Automobile Club held its opening meet at Eserick Park, by invitation of Lord Wenlock, on Saturday.

### THE A.C.G.B.I. TRIALS.

WITH reference to the recent lamp trials of the A.C.G.B.I. we have been asked by Messrs. George Polkey, Ltd., to give publicity to their views with regard to the same, from which they withdrew their lamp after it had been run about 1,700 miles. Their report is based upon the observations of a director, Mr. John Polkey, who examined the lamp every day, and was therefore well able to judge of its condition. The manner in which the trials were conducted was considered by the firm to be unsatisfactory, and they "withdrew from the trials owing to the publication by some of the motor press of incorrect and incomplete reports which were misleading to motorists." With regard to this suggestion we may recall a reference to our own columns of March 17, when we said "comment on the performances may fairly be left over till the official records of the judges have been obtained."

The report of Mr. John Polkey on the lamp in the trial is as follows:—

1. Mileage run to date of withdrawal about 1,700 miles. (2) Consumption of oil, one pint for twelve hours, cost one penny. (3) Capacity ten hours. (4) Glass chimneys broken, none. (5) Front glasses broken, none. (6) Wicks. Original still in use. (7) Burner. Original still in use. (8) Parts damaged or broken, none. (9) Reflector not cleaned by us at all, still in good condition. These important points had been ignored up to date of withdrawal. (10) Our bracket fitted by car owner was lengthened and shaped to form a spring and then fitted on car front dumb iron (to which our representative objected.) (11) Exterior only cleaned (by garage boy) every day. Light tested up-to-date of withdrawal by daylight. We therefore concluded the results of such a trial would not be very convincing and withdrew.

### THE SOUTH HARTING HILL CLIMB.

IN connection with the South Harting hill climb to be held to-day (Saturday), Mr. M. F. Mievile, the secretary of the Sussex County Automobile Club, has arranged that all competing cars which cannot

The Course and Gradient of the South Harting Hill Climb.

conveniently reach Petersfield on the morning of the competition can be garaged free overnight at the West Sussex Motor Company's garage in Chichester. He has also arranged with the company to have a good supply of petrol, accumulators, tyres, and lubricants at Harting, close to where the cars start for the climb.

### THE MIDLAND CLUB HILL CLIMB.

THE Midland A.C. hill climb was held last Saturday in the private grounds of Court House, Shelsley Walsh, Worcestershire, by the permission of Mr. M. C. H. Taylor. There had been much rain over night, which made the road surface very slippery, and several light cars had great difficulty in mounting the hill, the gradient of which in several places is about 1 in 6 $\frac{1}{2}$ , and the total length of the distance 1,100 yards. Most of the London competitors journeyed down on Friday and stayed the night at Worcester. The weighing-in taking place shortly after 9 o'clock necessitated the Coventry and Birmingham cars starting early. By invitation of Mr. Oscar Harmer, we took a seat in his 30-h.p. Daimler, starting from Coventry in the early morning. Although threatening, luckily the weather kept fine during the open event, but as soon as the closed competition was started a severe thunderstorm broke out and rain came down in torrents. Mr. T. H. Ryland, the hon. sec. of the club, worked well in looking after the Press, and all the officials were zealous in the performance of their duties.

In the open handicap three Alldays cars of 10-h.p. were first, second, and third, their times being 3 min. 25 1-5 sec., 3 min. 29 4-5 sec., and 3 min. 40 1-5 sec. respectively. Similarly the 10-h.p. Alldays car won the gold and silver medals in the closed event, the silver medal going to Mr. Cecil Edge on the 40-h.p. Napier. For the two events there were sixty-seven entries, among them being Mr. E. M. C. Instone, 35-h.p. Daimler, who climbed the hill in the good time of 1 min. 26 1-5 sec., but, like the other Daimlers, was heavily

handicapped; Mr. J. A. Holder, 12-h.p. Wolseley; the Maharajah of Tikari, 40-h.p. De Dietrich; Mr. G. F. Heath, 20-32-h.p. Darracq, and Mr. O. Harmer, 30-h.p. Daimler. The best time of the day was accomplished by Mr. Frederic Coleman on his 18-h.p. White steam car, which went up the hill in 1 min. 20 2-5 sec., a capital performance that entitled it to the cup for the fastest time.

### ROAD REPORTS.

**SURBITON.**—The District Council has decided to apply to the Surrey County Council for an extra grant from the funds derived from the issue of motor licences towards defraying the extra cost incurred for watering that portion of the Portsmouth road in the Council's district.

**TAUNTON.**—As an experiment for preventing dust, the tar-painting of fifty yards in length of one of the main roads has been resolved upon by the Taunton Town Council.

**ESHER.**—Main road maintenance in the Esher and Dittons district will, this year, cost £2,412—an increase of £912.

**BECKENHAM.**—The Beckenham Rural District Council is inviting tenders for patent tar macadam, and, as an experiment, will lay it in short stretches on two roads where there is much traffic, including, of course, that of motor-cars. The limit of expenditure ranges between £1,400 and £2,000.

### PUBLIC MOTOR SERVICES.

A PUBLIC motor-bus service between Fraserburgh, Rosehearty, and New Aberdour, N.B., was started last week.

THE Southwark Borough Council is asking the Commissioner of the Metropolitan Police to take steps to effectually control the speed of motor-buses in the public streets and to regulate their stopping places.

MOTOR-CARS are now competing against the Stirling and Bridge of Allan trams.

NINETEEN motor-buses have just been licensed by the Watch Committee of Hove to ply between there and Brighton, Worthing and Steyning.

THE Manchester Corporation is about to put six more motor vehicles into service between Sale and Northenden and Chorlton and Manchester, to supplement the present service to the Palatine Road terminus.

TWENTY motor-buses in Birmingham have been re-licensed for a period of six months.

### THE DU PRE CHALLENGE CUP.

It has been found inadvisable to hold the competition for the cup presented by Mr. Wm. Baring Du Pre to the Automobile Clubs of Leicester, Nottingham, and Derby in North Leicestershire this year, in accordance with the terms upon which the cup is competed for, and it has accordingly been arranged that the contest shall take place at Hazlewood Hill to-day (Saturday) at 2.30 p.m. The cars must assemble at Hazlewood Station, and must weigh in with passengers at that station between 1.30 p.m. and 3.30 p.m. The weight ticket must be handed to the starter together with the entry form. Hazlewood is on the Duffield and Wirksworth road and about six miles from Derby. Competing cars should proceed to Duffield and take the first turn to the left on entering that place, and take the first turn to the right, which is about two miles further on. The cup will be awarded to the car achieving the most meritorious performance; all cars, no matter of what h.p., will have an equal chance of winning. The competition has been declared to be a closed competition by the A.C.G.B.I., and will be held under the rules of that body.

### INTER-CLUB RUN TO BUXTON.

THE following clubs are taking part in the above run to-day (Saturday), the arrangements for which are being made by the Manchester Automobile Club:—The Halifax Automobile Club, Midland A.C., North East Lancashire A.C., Sheffield and District A.C., and the Yorkshire A.C.

As previously announced, there is to be no procession of cars going or returning, but all cars should arrive at the Empire Hotel, Buxton, in time for a photograph to be taken of the assembled cars at 5 o'clock. Dinner will be at 7 o'clock.

It is suggested by the committee that club badges should be worn as a means of identification between the members.

### A MOTORIST ASSISTS THE POLICE.

IN a case at Barnsley, it has just been shown how the motor-car had come to the aid of the police in detecting a furious driver. The defendant was George Hall, a butcher, of Dewsbury, and on the 2nd inst. Mrs. Pearce, wife of Dr. Pearce, of Darton, whilst looking from a window at the house saw the defendant driving a couple of horses attached to a wagonette through the village. The man was whipping the horses, which were going at a dangerous speed. Mrs. Pearce told her husband, and, considering the matter to be a proper one for interference, Dr. Pearce got out his motor-car, and finding Sergeant Stewart, they gave pursuit, overtaking the defendant at Newmillerdam. Defendant did not appear, but had written admitting his guilt, and was fined 20s. and costs.

### CASES AGAINST MOTORISTS.

*[It must be understood that it would be impossible to report all the cases that are heard every week; we therefore endeavour to give only those which involve points of particular legal importance or of public interest.]*

AT Snaith last week a batch of motor-car drivers were fined for having covered at an excessive speed a measured quarter-mile of road at Eggborough village, midway between Selby and Doncaster. In one case, Owen Williams, engineer, of Glasgow, in addition to being summoned for having driven at the rate of twenty-four miles an hour, was summoned for being without a licence. The defendant's solicitor stated that the defendant had a licence, but it lapsed, and the renewal had slipped his memory, as he was on his honeymoon at the time. In the circumstances, the magistrates dismissed this charge on payment of costs, but for the other offence defendant was fined £3 10s.

THE victims of police activity on the measured distance between Fishergate and Southwick have come before the Shoreham Petty Sessions. There were nine prosecutions, and convictions were obtained in eight of the cases, adjournment being granted in the other. After the fines had been announced, P.C. Marsh was congratulated by the Bench on the plans placed before the magistrates in connection with the matter. From evidence tendered it appears that Mr. Walter Long, watchmaker, of North Street, Portslade, is the official watch tester for the local police. The defendants came from London, Walsall, Hove, Buxton and Manchester, and the chairman of the magistrates acknowledged that the road was the most dangerous in the county.

Mr. W.W. Perks at the wheel of the 10-12-h.p. Argyll car, the property of Messrs. McDowell, Steven & Co., of Upper Thames Street, London, E.C. Mr. Perks is the first to gain the prize under the drivers' prize scheme of Argylls London, Limited, and succeeded in running the car at a cost of 1'181d. per mile for a distance of 5,000 miles.

THE prosecution of Mr. E. A. Barker, the Barnsley Borough Electrical Engineer, at the Leeds Police Court, for furious driving, was notable for his solicitor animadverting upon the unreliability of the timing arrangements. Thereupon the deputy chief constable promised that the watch should be tested forthwith; in the meantime Mr. Barker was fined 20s. and costs.

THE chauffeur to Mr. G. Cornwallis West has been fined £5 and costs for driving a motor-car beyond the speed limit at Finchley. Mr. West paid the money and threatened that if such persecution continued he would no longer subscribe to the police charity funds.

AT Daresbury a chauffeur in the employ of Messrs. Lawton and Sons, Ltd., of Liverpool, has been fined £2 for covering a distance of 4 miles 830 yards at the rate of 41½ miles per hour. At Northwich another motorist was fined 20s. for a speed of thirty-four miles an hour, while a lady who drove at a rate of four miles less was fined 2s. 6d. more.

MR. F. J. BIRCH was the leading witness for the police against a motor-car driver, James Begg, who was summoned at the Westminster Police Court last week for driving his vehicle in a dangerous manner. Mr. Staplee Firth defended and characterised the evidence as fable or fiction with a wealth of florid expressions but no real evidence. The magistrate agreed and the summons was dismissed.

ALTHOUGH he was alleged to be driving at a speed of thirty miles an hour between Littlemore and Sandford, Mr. E. A. Morel, of Penarth, was only fined 10s. and costs at the Bullingdon (Oxford), Petty Sessions.

AT Guildford county bench on Saturday fines amounting in all to £60 were inflicted on motorists, in most cases for exceeding the speed limit at Witley, Shottermill, Artington, or Ockham.

AT Carlisle on Saturday, Dixon Losh Thorpe, of Carlisle, was charged with driving a motor-car at a greater speed than twenty miles an hour at the Todhills trap, to the north of Carlisle, on May 30th. Mr. Thorpe denied that the car ever exceeded twenty miles an hour,

He said he had made tests at Todhills, the result of which showed that it was impossible to tell without a signal when the measured distance was entered upon. In the end the magistrates decided to adjourn the case for a week in order that they might view the place and satisfy themselves as to the points raised.

A COVENTRY motorist was summoned at Stratford Police Court on Saturday for driving a motor-car at more than twenty miles an hour at Epping New Road, Woodford, on May 22nd, and also for having no licence. Sergeant Weber and Constable Hill timed defendant over a distance of 220 yards. When stopped it was found that his licence had run out a month. He was fined 40s. and costs on the first summons and 10s. and costs on the second.

AT Haywards Heath Petty Sessions several motorists have been charged with driving beyond the legal speed limit. With one exception fines were inflicted. William Fletcher, of Harley House, Marylebone Road, who had been previously convicted, was ordered a month's imprisonment and his licence was suspended for six months. Police-Sergeant Waghorn said that defendant was travelling at Slaugham at a speed of forty miles an hour. The chairman (Major Borrer) said that in future at that court the maximum penalty would be inflicted on all motorists travelling beyond ten miles an hour over dangerous cross-roads. The police would be instructed to charge offenders with driving to the danger of the public.

MR. A. K. BROOK, a London solicitor, has been fined 10s. and costs for leaving a motor-car unattended in the Bull Ring, Horncastle, for half an hour.

### THE LAND'S END—JOHN O' GROAT'S MOTOR-CYCLE TRIAL.

THE trial of motor-cycles from Land's End to John o' Groat's, a distance of 889 miles, organised by the Auto-Cycle Club, was concluded on Saturday. Out of the seventy-five competitors who started, the following thirty-five successfully completed the long journey:—A. H. Albert (3½-h.p. Quadrant), W. Harrison (3½-h.p. Quadrant), A. Williams (3½-h.p. Quadrant), W. H. Wells (5-h.p. twin-cylinder Vindee), H. G. Cove (2½-h.p. De Dion), H. E. Blackney (4-h.p. twin-cylinder Werner), P. C. Camporale (3½-h.p. Rex), M. J. Tuchmann (3-h.p. Quadrant), Rev. B. H. Davies (3-h.p. Triumph), J. Tassell (3½-h.p. Matchless), E. W. Ashworth (4-h.p. twin-cylinder Werner), F. Hulbert (3-h.p. Triumph), S. Bramley Moore (3-h.p. Triumph), W. Brough (3½-h.p. Brough), J. F. Dixon (3½-h.p. Bradbury), R. M. Brice (3½-h.p. Brown), W. Milnes (3½-h.p. Phelon-Moore), R. Moore (3½-h.p. Phelon-Moore), W. G. Brooks (5-h.p. twin-cylinder Rex), S. W. Carty (3½-h.p. N.S.U.), H. L. Cooper (3-h.p. Triumph), A. W. Browne (7-h.p. twin-cylinder Lurquin-Coudert), D. Poupert (3-h.p. Fafnir), F. E. Cox (5½-h.p. twin-cylinder G.B.), F. W. Applebee (3½-h.p. Rex), W. Hayes (5-h.p. twin-cylinder Rex), W. Hayes (5-h.p. twin-cylinder Rex), G. W. Blackaller (3½-h.p. Quadrant), H. R. Dougal (4-h.p. Stevens), Tri-cars and Quad-cars.—H. G. Priest (6-h.p. Quadrant carrette), A. B. Albert (6-h.p. Quadrant carrette), J. van Hooydonk (6-7-h.p. Phoenix quadcar), Wilbur Gunn (10-h.p. Lagonda tri-car), A. Carmeal, jun. (9-h.p. Riley tri-car), and Miss Muriel Hind (9-h.p. Singer tri-car). The latter met with considerable trouble, but, with a determination that made her very popular, Miss Hind surmounted every difficulty and successfully accomplished the end-to-end ride. On the last day A. B. Albert (Quadrant) had hard luck with his machine, which had run perfectly up to that time. The valve in the rear tyre began to leak, making it necessary to pump up every two or three miles. Finally, wearying of these frequent stops, Albert rode the last seventy miles on the rim. F. W. Applebee (3½-h.p. Rex) ran out of petrol eleven miles from the end, and tried to run on paraffin. This did not prove a success, however, and he had to send back some miles for petrol, which resulted in his arriving at John o' Groat's late in the evening.

### THE DRAWBACKS OF WIND SHIELDS.

MR. WALTER DEMUTH appeared before Sir Albert de Rutzen at Bow Street Police Court on Saturday to a summons charging him with driving a motor-car on a public highway in a negligent manner.

Mr. Herbert Muskett, who supported the summons on behalf of the Commissioner of Police, said the proceedings were taken under Section 1 of the Motor Car Act of 1903. Shortly before ten o'clock on the night of Sunday, the 6th ult., a cab, in which Dr. Lankester was seated, when passing the top of Birdcage Walk towards Buckingham Palace Road, was dashed into by a motor-car driven by Mr. Demuth. The cab was badly damaged. Mr. Demuth subsequently explained that he was unable to see where he was going owing to the reflection of the arc lamps at this spot on the glass wind screen of his car. He (Mr. Muskett) thought that, in the interest of the public, the use of these screens should be discontinued if motor-drivers were unable to see through them. Dr. Lankester said he thought the defendant sounded his horn just before the collision occurred. The car was only going at a moderate speed, but it went for the cab like an avenging angel. Dr. Lankester added that he had received from Mr. Demuth a very polite letter relating to the accident, and he produced it for the magistrate's information. The defendant said the accident was caused in the way described, and not because he drove negligently. Sir Albert de Rutzen said Mr. Demuth ought to have stopped his car when he found that the wind screen obstructed his view, and must pay a mitigated penalty of £5 and £3 costs.

### POLICE TRAPS.

THERE is a police trap at Slyne, near Bolton-on-Sands.

A CORRESPONDENT writes, there are several traps on the Bath road in the neighbourhood of Maidenhead. There is no safety between Slough and Twyford.

THE Upper Shoreham Road, Southwick, is a place of police resort. Motorists should take warning.

THE new police trap devised by the Cheshire police is now in operation at Stockton Heath, Northwich, and other places. Constables are stationed at distances of one, two, or even more miles apart, and keep a record of the times at which all motor-cars pass them. So far the speeds recorded have been good.

THERE is a measured 220 yards on the St. Leonard road, Ayr.

SEVERAL traps have been notified on the London and East Grinstead road, notably at Godstone.

AT the Colchester Police Court on Tuesday, P. C. Friend described the setting of a police trap a quarter of a mile long opposite St. John's Church, Ipswich.

### THE STORAGE OF PETROL.

WILLIAM MARSHALL, of the South Shore Motor Garage, the Promenade, Blackpool, was summoned at the Blackpool Police Court for keeping and selling petroleum without a licence, and also for contravening the petroleum regulations.

Inspector Butterworth spoke to finding tins of petroleum in the Garage at South Shore, and also forty-four empty tins, which were more or less dangerous, as they sometimes contained vapour. With regard to the breach of regulations, the inspector said he found a two-gallon tin, a number of empty ones, and two partly-filled in a store. The Chairman (Ald. Fish) told the defendant that the seriousness of the case could be seen by the fact that they could impose a penalty of £20. They, however, would be lenient, and impose a fine of 20s. and costs in each case.

### THE NECESSITIES OF TRAFFIC.

SHERIFF ARMOUR has heard proof at Cupar Sheriff Court in a motor-car prosecution case, in which John Webster, motor-car driver, Kemback, was charged with having on Monday, 21st May, on the highway between Pitscottie and Dairsie, failed to stop the engine of a motor-car which he had drawn up in consequence of a horse under the charge of a ploughman having become restless and unmanageable. A plea of not guilty was tendered, and it was stated for the defence that the Motor Car Act provided that when a motor-car was stopped for any reason other than the necessities of traffic, the engine must be stopped to avoid noise. In the present case the car was stopped owing to the necessities of traffic, and it was not therefore compulsory to stop his engine. In course of the evidence it was said that the car was stopped through a horse becoming frightened and swerving across the road. His Lordship held that this was a stoppage that was due to what might be described as the necessities of traffic, and he therefore found the accused not guilty.

### MOTOR-CAR LAW ANOMALY.

MR. E. T. GILES, of Streatham, was summoned at the South-Western Police Court last week for driving a motor-car to the common danger of the public. It was alleged that Mr. Giles passed a furniture van on the off-side and ran into a police-sergeant and his wife, who were cycling at the time, and severely injured them. A fine of 40s. and 23s. costs was imposed. Defendant's solicitor asked that the licence might not be endorsed. The magistrate, Mr. Francis, stated that he had no discretionary power in this case. When a man is knocked down and killed the driver of the car need not have his licence endorsed, but when the car is driven too fast and a penalty of a shilling imposed, then it is necessary to have the endorsement. Such is the inconsistency of the motor-car laws. The licence was consequently endorsed.

### A MOTOR-CAR COLLISION.

AT the Coventry County Court, last week, a motor-car case was called before his Honour, Judge Ingham, and a jury concerning a collision in Coventry. Fredk. John Hibell, Queen's Road, Coventry, sued the Humber Motor Company, Ltd., for £10 damages sustained by the alleged careless or negligent driving of a motor-car by one of the company's servants. Mr. J. F. Eales (Messrs. Band and Hatton) represented plaintiff, and at the conclusion of his opening statement a settlement was arrived at, the defendant company agreeing to pay £7 and costs in full settlement.

### MOTOR-BUS CASES.

FOR driving in a manner dangerous to the public in the Finchley Road, C. W. Simons has been fined 30s. and costs at Marylebone Police Court. While driving a Vanguard bus he knocked down a policeman. It was subsequently discovered that the defendant was learning his duties. Another motor-bus driver who "narrowly escaped collision with a cab" was fined 40s. and costs on the same occasion.

# THE Motor-Car Journal.

VOL. VIII.]

LONDON, SATURDAY, JUNE 30, 1906.

[No. 382.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

## COMMENTS.

THE Select Committee of the House of Commons to whom the Cabs and Omnibuses (Metropolis) Bill has been referred, have now reached the consideration of the question as to the advisability of recommending fresh regulations as to motor-buses and electric trams. At the meeting of the Committee, on Tuesday, Mr. Henry Norman presiding, Chief Inspector

Basson was inclined to think that the Chief Commissioner of Police might withdraw opposition to the London County Council's proposal to increase the speed of tramcars to fifteen miles an hour, but would not sanction any greater speed than now for motor-buses. Mr. A. A. Campbell Swinton, M.I.C.E., said that he had been appointed to give evidence on behalf of the Motor-Van, Wagon, and Omnibus Users' Association, representing more than 400 motor-buses now running in the streets of London, and carrying about one and a-half million passengers per week. The motor-bus was in process of rapid development, and in a year or two would be very different from what it was now. Therefore it was very undesirable that regulations should be made which would stereotype the present bus. As to noise, that was a matter which depended on the width of the street and the state of the pavement. The bad state of the streets was due to the horse traffic, and when horses practically disappeared from the streets there would be no difficulty in keeping the roads smooth, and the noise would then disappear. As to smoke, that was chiefly due to over-lubrication. A little time should be allowed to let matters get straight. At present skilled drivers were practically unobtainable, for they were driving private cars; at that they had a much easier life. The bus proprietors had to teach their men to drive, which was a slow process. In time all omnibuses which gave off smoke should be ordered off the streets; but this regulation should not be pressed on too hurriedly.

### Australian Advance.

MOTOR-CAR advance is undoubtedly being made in Australia, and good work is being done by the Roads Improvement and Touring Association of Melbourne in arousing the Colonial mind to a due appreciation of the importance of good roads in developing the resources of the country, as well as making easier the path of the automobile. In South Australia motorists have become so numerous that the Government has sought to apply stringent regulations to motor-cars in the districts outside of Adelaide. At a meeting of one of the local authorities the mayor reported that he had received a copy of regulations which the Government intended to proclaim under the Motor Traffic Regulation Act, 1904. Regulations for the control of traffic in Adelaide had been adopted. They contained, in addition to clauses providing for lights, bells or horns, and silencers, and an obligation for drivers to stop in case of accident, provision to guard against negligent or reckless driving, and to restrict the speed to fifteen miles an hour within

certain boundaries, and to thirty miles an hour in any other part. It was resolved by the Council to petition the Attorney-General to allow the speed of motors in the suburbs to be raised to twenty miles an hour. The mayor thought motorists were already surrounded with regulations, and to keep them down to fifteen miles an hour would be to impose too great a restriction. He had had some experience, and could assure the Council that twenty miles an hour was a moderate speed. Evidently the automobilists of Australia have to encounter opposition almost as virulent as some of the prejudice which has had to be combated in the old country.

### Ladies and the Car.

THE presence of ladies in connection with the social events organised by the various motoring associations must be regarded as among the reasons of their success. Now some of the clubs are going further than of yore, and consideration is being given to the question of admitting the fair sex to full membership. The Liverpool Automobile Club has already come to a decision in the matter, having agreed to admit them to membership at an annual subscription of half-a-guinea. It has also been resolved that "Ladies proposed for membership must be members of their proposer's family, and that they shall enjoy the use of the club room between the hours of 3 p.m. and 7 p.m. daily, and that they shall, with the exception of the right to vote at meetings of the Club (either committee or annual), be entitled to the full privileges of membership." London is now being traversed by three or four ladies in a motor-car bearing the legend, "We demand the vote"; it is to be hoped they will not invade the harmonious haven of the Liverpool Automobile Club.

### Accommodation for Motorists.

ONE of the most notable impressions of a tour in Scotland is the evidence afforded of the universal desire to cater for the requirements of motorists. Throughout the country every hamlet as well as popular resort proclaims its provision for the accommodation of cars, the supply of petrol and desire that motorists should halt within its area. The contrast between a journey by road in this country and north of the Tweed is extremely great on this account, and indicates a recognition of the commercial value of the motorist in the latter land which is certainly not so observable in England.

### The Argyll Works.

ON the shores of Loch Lomond the new works of the Argyll Company are now getting into running order, and already more than sixteen hundred men are finding employment in this modern factory. Pleasantly situated in the open country, this new establishment is really a model industrial palace, the conditions of light and air being all well considered in the design. Not only has regard been paid to the conditions under which the men will work, but in the provision of workmen's dwellings in the locality and the organisation of music and recreation in their leisure hours the directors have shown a

proper concern for the welfare of the new community that is being attracted to Alexandria by the development of this enterprise. The land purchased for the works covers 53 acres, and the official opening on Tuesday served to emphasise the keen interest with which the whole of the automobile movement in this country regards the success of the Argyll works and the Argyll cars.

#### Motor Ambulance.

THE presence of a motor ambulance in one of the shops, intended for the St. Andrews Association of Glasgow, indicated a department of activity which is likely to figure materially in the automobile output of the future. In London the matter has hung fire many months, and apparently the central authorities are prepared to allow the leaders in such work elsewhere to be pioneers with regard to motor ambulances. In view, however, of the saving in time, and consequently of

The Du Pre Challenge Cup. (See page 400.)

The first illustration depicts Mr. Ross Brown on the 35-h.p. Brasier, and the second one Mr. R. Cripps on the 16-20-h.p. Argyll.

pain, made possible by the motor ambulance in rural and suburban districts, it is to be hoped that development in the future will be much more rapid—particularly as makers of automobiles have shown their capacity to design and construct suitable vehicles of the kind required for such humane service.

#### A Conviction to Stand Over.

ON Thursday of last week, at Hayward's Heath, Mr. E. G. Hemmerde, instructed by Messrs. Kenneth Brown and Co., made application on behalf of Mr. William Fletcher that the sentence of one month's imprisonment and the suspension of Mr. Fletcher's licence for six months should not take effect pending the appeal against the conviction which had been lodged. Counsel pointed out that Mr. Fletcher had under an entire misapprehension pleaded guilty to the summons charging him with driving at a speed dangerous to the public, whereas the police at the time they stopped Mr. Fletcher gave him notice in writing to the effect that he would be prosecuted under Section 9

of the Motor Car Act, and, in consequence, the telegram that Mr. Fletcher had sent was forwarded entirely under a misapprehension. Mr. Fletcher entered into a recognisance for £200 to prosecute the appeal, and the Bench acquiesced in the application. The hearing of the appeal has been fixed for October 16th next.

#### The Motor Union.

THE development of high-handed, or High Barnet justice with regard to motorists shows the necessity for organisation among them; the way in which the Motor Union has interested itself in the case of the motorist who has been be-garbed in convict's clothes, because he did not pay a fine, proves the lively concern it takes in all that interests motorists. The case is to be argued before a Divisional Court of the King's Bench on the 10th prox., so that we are precluded from comment on the matter. This does not, however, prevent us from congratulating the Motor Union on taking prompt and effective action to secure a writ of habeas corpus and the order from Mr. Justice Phillimore for the hearing of the matter in a higher court.

#### Next Year's Trials.

TIME will soon be opportune for the provisional arrangement of events in connection with next year's trials and tests, and we would suggest that the A.C.G.B.I. might well take early action in bringing before the various clubs likely to organise competitions the advisability of avoiding such clashing of dates as recently took place when the Irish and the Scotch Trials occurred simultaneously. This is rendered all the more necessary now that the Welsh club promises to enter the lists of trial promoters. There are parts of the Principality eminently suited to the purposes of a Reliability Trial, and something like joint action in the selection of dates will be necessary as events become more numerous and cover a wider range of interest. Already, with regard to the Scottish Trial of 1907, the committee are being favoured with suggestions, one of which is that the event should be run over the same course but reversing the route, so that it would practically begin with a climb to the "Rest and be Thankful"—an idea not regarded very favourably by many familiar with the gradients of the district.

#### Another Trial.

OF the proposing of trials there is no end, and some are rather given to fear that these will soon make up practically the whole of the automobile year, leaving little time in which the manufacturers and agents can do their business. At the present time the A.C.G.B.I. are considering a suggestion to organise a contest of motor-cars for town use, as distinguished from those suitable for touring and general purposes. It is thought that the various types of vehicles—petrol, steam, and electric—might well be tested with regard to their merits for society use, emphasising smokelessness, absence of vibration, noise, &c., as well as other features of importance. Something might also be attempted as to the bodies themselves, so as to secure an acceptable combination of utility with appearance.

#### Correct Entries.

MENTION of trials suggests a growing practice that should be discouraged by those responsible for the receipt of entries. In the recent Scottish Trial some discrepancies were noted as to the cylinder dimensions and horse-power, and in one glaring case of similar horse-power the cylinder dimensions were so contrary as to suggest a mistake somewhere. At South Harting, too, on Saturday, dissatisfaction was expressed with regard to the same point, and one competitor declined to start—by way of protest—when he ascertained that one entry was found to be of different dimensions to that ordinarily sold as a standard touring car. The time is coming when the

entries at all these competitions will have to be carefully overhauled and checked with any available data, so that makers entering wrongly described cars may know of their own errors—or, at least, recognise that someone else may discover the mistake.

#### Observers.

AMONG the minor details of organisation to which recognition should certainly be given in future is the size of the observers appointed to the cars. As a whole those officially appointed on the last event did their work well, although some few cases of officiousness, or of a desire for mathematical exactitude rather than a display of common sense, occurred. But cannot a weight limit be applied? One observer with his baggage lowered the scale at 23 stone; another with his impedimenta weighed over 19 stone—some were excessively lean, and found bags and coats useful in bringing the aggregate weight to a reasonable total. When hill climbs are of daily occurrence

in that district who own cars. The handbook contains a list of hotels and garages which give a discount to members staying at those places, route maps from Newcastle, Sunderland, Durham, West Hartlepool, Stockton and Darlington, several pages ruled for notes of runs, &c., and much information of local utility. Certainly the Association deserves the support of all motorists who reside within the area of its operations.

#### The Dust Question.

THE ninth annual conference of the Association of Cleansing Superintendents has been held at Salford. Mr. W. H. Hamblett (Cleansing Superintendent, Salford, President of the Association), in the course of his inaugural address, referred to the questions of the future, one which was urgently pressing for solution being that of the sanitary conditions of roads and streets. The electric trams and motor-cars had come to stay, and if they were not dust creators they were

The South Harting Hill Climb. The Cars lined up behind the Starting Point (See page 400).

the change of observer, say from 23 to 10 stone, may mean much in estimating the performance of the car. We recognise that the subject must be approached with more than the average Scottish caution, but it should not be difficult to avoid such disproportions in future.

#### In the North East.

THE most comprehensive Year Book yet issued by any of the automobile associations, apart from the A.C.G.B.I. and the Motor Union, is that of the North Eastern Automobile Association, which has now the largest membership of any motoring club in the provinces. The system of local organisation developed by the association has proved most successful, both in knitting together the motorists of the north-eastern corner of England and in maintaining the rights of those

here as dust raisers, and they had served to emphasise and make more general and permanent a complaint, a nuisance, and a danger to health which only a few years ago was very limited and much more easily dealt with, and not troubled so much about by the public. In towns where granite pavement obtained there was not the same intensified cause of complaint as where the roads were macadam; but even in the villages demands were constantly being made for some remedy which should at least minimise the nuisance and the danger to public health. He went on to say that so wide was the difference of opinion with regard to the utility of the various "dust-layers" on the market that he had made a serious attempt to persuade the Executive Council of the Association to endeavour by practical tests, and, if necessary, by the expert advice of some leading chemist, to endeavour to obtain a medium which would be both efficient and economical, in the hope that the time was not far distant

when there would be no complaining in regard to dust in the roads and streets.

#### Progress in Ireland.

SIGNS are not wanting that the motor movement in Ireland is developing very rapidly, especially having regard to the limitations that naturally arise in a country where no great industrial development is taking place. The Motor Directory published by Mr. W. A. Tempest brings this fact clearly before us, containing as it does the names and addresses of more than 3,000 motorists in the Emerald Isle, about two-thirds of whom are motor-cyclists and the remainder owners of cars. This excellent directory has now got into the second year of its usefulness, and, in addition to the list of names, contains the Motor Car Act of 1903, together with the Local Government Board regulations, tables of speed, a list of hotels, &c., completing a useful work in which a couple of pages devoted to roadside troubles is not the least interesting feature.

#### A Dismissal at Kingston.

NOT often are dismissals of cases against motorists secured at Kingston; hence Mr. Staplee Firth is to be congratulated on having secured such a result in a case where Superintendent Marks was concerned. Mr. Rupert Williams was summoned for driving dangerously, despite the fact that he was carrying five passengers, and his car had only just come from the repair shop, added to which was his knowledge of the trapping propensities of the police of the locality. The police asserted their capacity to discriminate as to the distance of a motor-car when out of sight by the blowing of the horn. Other equally surprising abilities were also acknowledged until photography was introduced into the case, and in the end even the Kingston Bench had to dismiss the case.

#### Dust in Derby.

It speaks well for the fairness of British journalism that both sides of most matters are given publicity by the leading journals. Where motorists write dispassionately they can generally secure replies to tirades against cars, and we congratulate Mr. C. J. Allin, the hon. sec. of the Derby A.C., upon his letter to a local paper replying to a spirited attack on automobiles as public nuisances. This was based upon the statement of a Lancashire farmer to the effect that he had spent £20 extra in veterinary fees owing to the illness of cattle eating hay impregnated with dust raised by motor-cars. Mr. Allin rightly points out that, so far as the county of Derby is concerned, the remedy lies with the authorities. Without a doubt the dust (caused by the hoofs of horses and iron-tired vehicles of all descriptions) is an unmitigated nuisance when raised by passing motor-cars, but while the roads of Derbyshire are "repaired" by rolling in the fresh metal with the previous sweepings of the surface, and even (as he has seen within five miles of Derby) with soil taken from the adjoining fields, there is bound to be dust in dry weather, and corresponding mud in wet weather. Under such circumstances only dust may be expected.

#### Prosecutions in Scotland.

UNDER the new Minute of Agreement with the Motor Union and the Automobile Club, the Scottish Club now carries out on its own account the support of legal cases or the testing of important principles, for which hitherto they were entitled to look for some support to the Motor Union. A point of extreme importance is one of the first thus to be dealt with. They have just had under their careful consideration the question of the jurisdiction of Summary Courts in Scotland other than the Sheriff Court. Various prosecutions have taken place recently before police magistrates, and the objection which has been urged on behalf of the defender to the competency of the jurisdiction has been repelled. The Scottish

Automobile Club are aware that, without committing themselves to any definite expression of opinion, the Crown authorities have advised that all cases under the Motor Car Act should be taken before the Sheriff, and they have taken legal opinions and are taking steps to test the matter in the Supreme Court.

#### A Daily Record.

MOTORISTS are not usually regarded as the most methodical of men; but that section which wisely keeps account of mileage and expenses will welcome the Motorist's Daily Record of Runs which Messrs. Charles Jarrott and Wm. Letts have edited and Messrs. Dow and Lester have published "to induce and maintain a more general indulgence in record keeping as applied to motor-car runs than has hitherto obtained." Under easily located headings will be found space for the entry of practically every detail connected with the running of the car, condition of roads, and all items of general or personal interest, so arranged that the writer can complete the story of each day's run in a few words. We commend the volume to motorists generally as a book of value.

#### Municipal v. Private Enterprise.

WHILE it does not come within our province to criticise the municipal policy which seeks to swallow all forms of private enterprise, the controversy which has arisen at Birkenhead, Blackpool, and other places with regard to opposition to motor-buses because they may prove serious rivals to the municipal tramcars cannot be ignored. We rather dispute the alleged right of local authorities to thwart or delay the progress of a new industry merely because it may threaten the profits obtainable by some older method. And yet that is what is happening in many places throughout the country. Thus when an offer was made to the Corporation of Blackpool of £2 a day for the privilege of running motor-cars to ply for hire on the promenade it was refused, on the ground that competition with tram-cars was not desirable. Such a view is an excessively narrow one, and has no regard to the ultimate benefit or convenience to the public.

THE Manchester crippled children's motor car ride will take place to Redesmere, Siddington.

THE Standard Motor Agency, Ltd., have removed from Regent House, London, W., to a new depot at 106, Albany Street, Regent's Park, N.W.

MR. FRITZ LOESER, the chairman of the Belsize London Agency, has just started on his 40-h.p. Belsize car for a 20,000 miles tour through the Continent, with a view of opening up business in the various centres.

MR. GRAHAM NOTLEY will open, on the road between Henley and Marlow, in Henley week, a garage large enough to house 400 cars, at which a large staff will be in attendance, and every facility given for the storage and repair of vehicles.

THE Adams Manufacturing Co., Ltd., have appointed the Dublin Autocar Co., of Dublin, sole agents for the Adams-Hewitt cars in the central counties of Ireland. The Dublin Autocar Co., of which Mr. A. W. Inglis is the manager, will shortly be in a position to give demonstrations of the standard type "R" car, together with trial runs.

WHILE the 20-22-h.p. Mobile car was ascending the Devil's Elbow on the second day of the Scottish Trial, the observer unfortunately switched off the switch underneath the coil, causing a loss of time of 55 seconds. This allowance will, we are informed, be given to the Mobile when the final results are made up.

ON Saturday the Daimler Co.'s employees, to the number of 850, went to Blackpool for their annual excursion. On the same day about 120 members of the office staff journeyed to Dunchurch by brake and motor for the annual picnic. Later in the day Mr. P. Martin presided over dinner at the Dun Cow Hotel.

# The Grand Prix Race.

LE MANS, Sunday.

WE made the journey by automobile, *via* Southampton and Havre, which seaport was reached shortly after seven in the morning, but, in consequence chiefly of unshipping the cars—there were several others besides our own—it was after ten o'clock before the departure for Rouen was made. At this interesting town a stay was made for the night, and an early start made next morning for Alençon, where *grand déjeuner* was partaken, and Le Mans was duly reached on Saturday evening. The weather was gloriously fine, and the roads—mostly national—were as straight as a die, albeit very dusty.

During special events people expect to pay more than at ordinary times at hotels. At Clermont Ferrand the Bonifaces contented themselves with charging twenty-five francs a day. The hotels, while of course not equal to those on the Riviera,

automobile world, and should be more generally followed by the similar bodies of other countries. After the cars were weighed, the drivers had to open their silencers and race their engines over a length of sand to test the efficiency of their silencers, with a view to the prevention of the dust nuisance. Twenty-six vehicles duly passed the ordeal of the scales to-day, these comprising three each De Dietrich, Fiat, Brasier, Darracq, Mercedes, Hotchkiss, two Clement-Bayard, a Gobron, an Itala, and four Panhards, one of the latter being a reserve car. The remainder will be weighed-in to-morrow. Afterwards the cars got rid of their excess of lubricating oil, with an effect similar to that of a dense London fog, with the addition of that pungent odour which lubricating oil usually gives. One noticeable feature of the racers was their quietude and their apparent ease of control. Most of them are built higher than

The Scene at the weighing in at Pont-de-Genne, on Sunday last.

were clean, and first-class specimens of provincial hotels. But here the proprietors have combined, and charge all and sundry fifty francs a day, with wretched, badly-cooked food, and accommodation which would disgrace a minor coffee-house. Moreover, the town itself is dirty and untidy. As for the garages, the owners have combined to make a charge of 10s. a car per night.

Our own car being *en panne* through the magneto giving out, we were indebted for a seat on the car of M. Hochmelle, late sporting secretary to the Automobile Club of France, for the journey out to the starting point at Pont-de-Genne, which is about 17 kilometres from Le Mans, and for our return, after ten hours in the paddock, to Mr. Heath, who drove in last year's Gordon Bennett race. The weighing-in took place in a field opposite the grand stand, and, as usual, was a lengthy and tedious affair. As is well known, the A.C.F. is nothing if not thorough, and its organising powers are well known to the

last year, when the tendency was to keep as near as the ground as possible.

As is generally known, pines grow on a specially loose, sandy soil, and round the neighbourhood, at all events of the grand stands, there are nothing but pine woods, hence, although the roads are tarred for a width of five feet in the centre of the road, there is still enough dust left to cover the clothes of the spectators and make their throats like leather. The paddock itself was inches deep in dust, and walking up and down innumerable times was very tiring work. All round were open stalls for the competing cars, but very few were occupied, they being scattered all over the place. The interior of the fence was kept exclusive for those who had work to do, but outside there were hundreds of cars and thousands of visitors, who comported themselves patiently in the broiling sun. It being Sunday, the whole surrounding population were taking advantage of the fact, and the consequence was that the roads were practically impassable.

Amongst those who have gained fame as speedy motorists, we noticed present, either as spectators or officials, Messrs. René De Knyff, Heath, Thierry, Farman, Stead, Siz, in addition to those in charge of racing machines this year.

Going over the course, it was found to be very much cut up, loose stones being far too plentiful, but the number of tar

10.30 p.m. with a confrere, when he suddenly observed, "What has become of all the people?" They had disappeared, so that we followed suit, he to a quiet abode; and we to a room overlooking the square. Proceeding to disrobe, we were startled by a diabolical row; the owners of all the instruments which had been sold during the day had formed themselves into a band,

Riches having a trial run on the Circuit on his Renault Racer. Siz, the Winner of the Race, drove a similar Car.

barrels by the roadside suggested the thought that possibly the roads would be tarred again, and the impression left on our minds was that luck and tyres would win the race. At all events, from the nature of the course, the times should be phenomenal, and at points it is hoped that "flying kilometres" will be taken.

Returning to Le Mans, the sight that presented itself was a most astonishing one; a procession of vehicles—horse, car, and cycle—was in progress, the occupants of many of which carried banners, and all vehicles were gaily decorated with flowers, while the profusion of flowers and confetti was overwhelming—most

which was followed by thousands of people, and soon the Place de la Jacobin was as crowded as before. The band commenced to play, the people set to partners, and when sweet Morpheus, somewhat after two in the morning, claimed us the proceedings were still continuing. It was the occasion of the annual battle of flowers.

#### LE MANS, Monday.

To-day the road between Le Mans and Pont-de-Gennes has been crowded with traffic, and the dust has been terrible. Seven of the remaining nine cars—three Renaults, a Gregoire, two Italas, and a Clement Bayard, were duly weighed. Barriaux

Rigolly on his Gobron Racer.

uncomfortably so. The noise of all the most hideous instruments that it had been possible to get together was indescribable; and what with the shouting of the purveyors of the halfpenny French papers, hawkers, etc., one would imagine that pandemonium had broken loose. However, we were sitting at a café, about

(Vulpes) has declared forfeit, his car having proved too heavy Tavernaux (Gregoire) will also be a non-starter owing, it is reported, to trouble with his engine. The number of competitors is thus reduced to thirty-two. As regards tyres, it may be of interest to add that Michelins are fitted to two of the

De Dietrichs, the Fiats, Renaults, Italas, Panharda, and Hotchkiss; Continentals to one of the De Dietrichs, the Mercedes, Brasiers, and the Gregoire; Gaulois to the Gobron, and Dunlop to the Darracqs and Clement-Bayards. In order to facilitate the replacement of tyres, many of the cars are fitted with detachable rims.

The start of the race in the morning has been fixed for 6 a.m., when the competitors will be despatched at intervals of a minute and a half. The last man is due away at 6.49½ a.m., or nearly 50 minutes after the leader. Fifty-seven minutes is reported to be the record for the circuit, so that there should not be a long wait ere the competitors begin to make their appearance after covering the first lap. The Sporting Commission of the A.C.F. has issued a notice asking visitors not to throw flowers or objects to the drivers as they pass. Special provision has also been made in case of accidents, doctors having been appointed to take up positions at short intervals along the route.

In Le Mans the number of people arrived was really startling, and there is wailing amongst the ladies as to where they will sleep. The men are content, and say they will sleep in the square on their cars. The night is warm—not to say sultry—and their decision will cause them no great hardship. This evening again the town is brilliantly illuminated, and the only moving thing possible, other than pedestrians and motorists, is the single-line tramcar, which has to proceed with extreme caution.

Gabriel, who was the first to be despatched, was in some slight trouble, and Lancia crossed the line before him. Lancia, too, was the first to cover the circuit, his time being 64 min. 30 sec., Sisz following a minute or so later. At the end of the first lap Cagno had to stop for petrol, as also did Salleron. Edmond pulled up at the grand stand at 9.40 a.m. to make some repairs. He was suffering badly with his eyes, he having broken his goggles. Jenatzy completed the third round with neither tube nor cover on one of the rear wheels, whilst Gabriel was stopped by a non-skidding band flying off and getting entangled with the chain gear. Out of the thirty-two starters, the following seventeen finished the day's run of 387 miles:—

Driver.	Machine.	Time.		
		H.	M.	S.
Sisz ...	Renault ...	5	45	30 2-5
Clement ...	Clement-Bayard ...	6	11	40 2-5
Nazzaro ...	Fiat ...	6	26	53
Shepherd ...	Hotchkiss ...	6	30	45
Barillier ...	Brasier ...	6	31	48 1-5
Richiez ...	Renault ...	6	35	47
Heath... ..	Panhard ...	6	48	12
Teste ...	Panhard ...	7	1	52 2-5
Lancia ...	Fiat ...	7	12	9 1-5
Hemery ...	Darracq ...	7	26	18 2-5
Rigolly ...	Gobron ...	7	36	8 1-5
Mariaux ...	Mercedes ...	7	39	31 2-5
Baras ...	Brasier ...	7	41	43
Duray... ..	De Dietrich... ..	7	58	46

Hemery (Darracq) and Baras (Brasier) at the Starting Point on Tuesday morning.

The procession of vehicles to the course is expected to be unexampled, and a start has to be made at 2.30 a.m., otherwise progress will be impossible. Even at this late hour (11.30 p.m.) vehicles are still arriving in endless procession.

#### THE FIRST DAY OF THE RACE.

LE MANS, Tuesday.

The start of the great race duly took place in splendid weather at 6 a.m. this morning; thirty-two competitors were despatched in the order shown in the appended table:—

No.	Driver.	Car.	No.	Driver.	Car.
A 1	Gabriel	De Dietrich	B 6	Mariaux	Mercedes.
2	Lancia	Fiat.	8	Fabry	Itala.
3	Sisz	Renault.	9	De Bosch	Gregoire.
4	Hemery	Darracq.	10	Tart	Panhard.
5	Baras	Brasier.	12	Salleron	Hotchkiss.
6	Jenatzy	Mercedes.	13	Villemain	Clement-Bayard.
7	Rigolly	Gobron.	C 1	Duray	De Dietrich.
8	Itala	Cagno.	2	Weilschott	Fiat.
10	Heath	Panhard.	3	Richiez	Renault.
12	Le Blon	Hotchkiss.	4	Hanriot	Darracq.
13	A. Clement	Clement-Bayard.	5	Pierry	Brasier.
B 1	Rougier	De Dietrich.	6	Florio	Mercedes.
2	Nazzaro	Fiat.	8	De Caters	Itala.
3	Edmond	Renault.	10	Teste	Panhard.
4	Wagner	Darracq.	12	Shepherd	Hotchkiss.
5	Barillier	Brasier.	13	De la Touloubre	Clement-B.

Pierry... ..	Brasier ...	7	59	5
Jenatzy ...	Mercedes ...	8	7	20
Rougier ...	De Dietrich ...	8	15	55

The hero of the day is, therefore, Sisz, who on his Renault made an average speed of about sixty-seven miles per hour. Duray made the best time in the first lap, taking 52 min. 32 1-5 sec., Baras being second with 52 min. 53 sec., and Weillschott third with 53 min. 40 sec. Pierry, on the third Brasier, was the best in the second round, with 52 min. 31 sec., while Barillier, on the second Brasier, was the fastest in the third circuit, which took 55 min. 23 2-5 sec., and Nazzaro (Fiat) in the fourth, with 55 min. 58 1-5 sec.

As regards those who failed to finish, it is reported that Le Blon (Hotchkiss) overturned at St. Calais. Fabry, who in the first round is reported to have covered a flying kilometre in 43 2-5 sec., ran into a wall, putting his Itala *hors de combat*. Hanriot (Darracq) is stated to have retired with a damaged engine. Weilschott's Fiat, after running well for five rounds, is said to have overturned. The Itala car, driven by Baron de Caters, also turned turtle near Bouloire. All the drivers complained of eye troubles, caused, it is said, by the nature of the composition with which the track had been covered.

Barillier on the Brasier Racer he drove in the Grand Prix.

#### THE SECOND DAY. [BY TELEGRAPH.]

LE MANS, Wednesday.

There was another exciting scene at the start of the second day's race this morning, when fine weather again favoured the event. The 17 remaining competitors were sent off at the same intervals of time as separated them at the end of the first day. One of the rules provides that all repairs must be made in the running time by the drivers and their mechanics, many of whom were busily employed near the Grand Stand in getting their machines in order. Nazzaro was one of the quickest away, while Richez and Shephard were amongst those who started behind time. News came to hand that Teste (Panhard) had met with an accident at one of the turns near Champagne. At the end of the seventh round Sisz's total time was 6 h. 47 min., Clement being 27 minutes behind. The latter, however, gained five minutes in the eighth lap, reducing Sisz's lead to 22 minutes. The times of the leaders for ten circuits were:—Sisz, 9 h. 56 min. 7 sec.; Nazzaro, 10 h. 40 min. 11 sec.; and Clement, 10 h. 41 min. 34 sec. Sisz, on his Renault, kept his lead to the end, and came in an easy first. Nazzaro (Fiat) finished second, and A. Clement (Clement-Bayard), third. The winner met with a rousing reception, and M. Barthou, Minister of Public Works, congratulated him on his victory, on behalf of the French Government.

THE Maudslay Motor Car Company, Ltd., have just completed a motor-omnibus to the order of Sir Marcus Samuel. The vehicle is intended for country house and station use, and is arranged so that it may be used either as a single or a double-decker. Further, when the seats are removed the centre rail on each side can be let down, so that goods can be placed on the top of the body by way of a portable ladder. The vehicle, it may be mentioned, is fitted with pneumatic tyres to all four wheels, although we understand that, in addition, a set of wheels is being supplied with solid tyres in the event of these being required. The pneumatic tyres fitted are Continentals of extraordinary size as pneumatic tyres go. The front wheels have 930 mm. by 150 mm. covers with plain treads, whilst the rears are 1,035 mm. The motive power is supplied by a 30-40-h.p. engine. The body is arranged to carry twenty-four passengers—twelve on the top and twelve inside.

#### TRAMS AND ROADS.

TRAMWAYS are necessary nowadays; they are, however, great monopolists of the roadways, often absorbing half the width, and consequently reducing the area available for other wheeled traffic. When the accounts of local authorities are made up for the entertainment of the ratepayers no notice is taken of the way in which they usurp the carriage way, to the possible exclusion and the certain congestion of vehicles unrestrained by the metal tracks.

But the growth of the tramway system which thus restrains the area of the roadway for vehicular traffic suggests that a widening of the main roads may ultimately be necessary. From London—save in the Brentford High Street and one or two other arteries—the main thoroughfares to the country are wide and commodious, and as yet the evil has not become so clearly apparent as in some of the northern towns, particularly of East Lancashire. But suburban authorities, when considering their tramway schemes, should remember the width of the road and provide for its widening, so that the interests of future years should not be jeopardised. Otherwise the trams will be laid along new districts, houses and shops will spring up, and then the expenses of razing them to the ground in order to make the roadway capable of carrying all the traffic will be so great that only a reckless Council would dare to make such a change. At Hull the Corporation recognises its duty in this respect, and wherever its trams are laid into the country districts the roads are widened to a distance of 100 ft., thus allowing the laying of the tram-lines without incommoding existing or possible traffic, which can find its own track between the trams and the pavement.

The present seems an opportune time for raising this point of municipal improvement, for it suggests a means of utilising some of the unemployed funds which, if not administered on business lines, may result in an aggravation of the evil they have been formed to ameliorate. In times of distress, work is often undertaken from sentimental motives, and wages paid for work that is unprofitable and even painful—witness the condition of Wanstead Flats, Essex, after the expenditure of the Relief Fund of a few years ago thereon. But to widen the roads in view of the growth of traffic that is now inevitable seems a necessary work and one that is admirably suited to the exigencies of the time.

## USEFUL NOTES.

◆◆◆

BEWARE of putting resin and other concoctions on the leather of a clutch; the cure by such agents as resin is only temporary and very detrimental to the leather, and resin, it should be noted, has the unfortunate property of becoming heated by the friction, and consequently sticking up the clutch so that it cannot be withdrawn when required. Beware also of having a car washed when the clutch is held out by the hand-brake, as the effect of water upon the leather is by no means good.

EVERY automobile speaks a language that can be understood by the exercise of a little patient effort. Then when a car signals that its carburettor is not working right, that a sparking plug needs attention, or that the lubrication is faulty, the understanding hearer knows precisely what to do and can remedy the trouble at once, thus saving himself both annoyance and expense.

HOT bearings may be the result of lack of lubrication, too close adjustment, or both, and should be carefully watched for, especially when the vehicle is new. Feel the bearings frequently at first, and if any one is found hot, see whether it is getting its proper supply of oil. If it is, but runs hot notwithstanding,

If a valve or the porcelain in a sparking plug breaks care should be taken to ascertain whether any of the pieces have got into the cylinder. If so, they should be removed before attempting to run the motor, as it does not take a piece of steel or a few chips of hard porcelain a very long time to so cut a cylinder that it must be renewed. As a rule, cylinder walls are not of sufficient thickness to permit reboring if it is necessary to take off more than the merest suspicion of a cut, and a few chips caught by the piston can make fairly deep grooves the entire length of the stroke.

◆◆◆

WHEN travelling over rough roads the driver should sit in such a position that the feet will not be shaken off the pedals. Otherwise, when the clutch is disengaged, as it should always be for a rough spot, and the car allowed to "coast," the feet may be jarred off the pedals, allowing the clutch to slam in, and causing great strain on the gears and transmission mechanism.

◆◆◆

WHEN a motorist has become somewhat expert in the running of his car it will be found advantageous to gradually cut down the petrol feed until the point is found at which the motor runs well, but will not stand a further reduction. The smaller the proportion of petrol the more economically the motor will run and the cleaner it will keep. This can, of course, be

Tests on the Panhard Racer he drove in the Grand Prix, and on which he met with an accident on the Second Day.

ease it a little by slackening the adjustment nuts or screws until it turns freely without lost motion. A little time spent in the adjustment of bearings is a good investment, for lost motion quickly multiplies itself. A bearing that is frequently adjusted will last much longer than one that is only attended to when the wear becomes serious.

THE compression strokes of a four-cylinder engine immediately succeed one another, so that one cylinder is always under compression, and in a six-cylinder motor successive compression strokes overlap. With such engines it is not very easy to determine whether there is any lack of compression, and which cylinder or cylinders are defective in this regard, unless some precautions are taken. The best method of procedure is to remove all the sparking plugs but one, and slowly turn the starting handle. This will give a test of the compression of the cylinder, which is closed by the plug, all the others working freely. After the compression of this one cylinder has been noted the plug may be removed and placed in one of the others, the compression of which may then be tested. All four or six cylinders may successively be tried by noting the manner in which their respective compressions may be overcome by turning the handle, and those which are unsatisfactory noted.

carried to extremes and the efficiency of the engine interfered with; but the proper feed can be determined without great difficulty. The same process should be applied also to the cylinder lubrication. When the petrol and lubricating oil are feeding into the cylinder in the smallest quantities that will produce good results, the motor should run for a long time without fouling the sparking plug and on the minimum amount of oil.

◆◆◆

WHEN about to pass over holes in the road, or short patches of loose stones, the car should have sufficient momentum to carry it over such rough places, so as to allow the clutch to be disengaged. This prevents racking the mechanism.

◆◆◆

MYSTERIOUS cases of motor missing fire can occasionally be traced to leaks in the admission pipe, the vibration of the car causing the leaking joints to open up, at times to such a degree that enough air will be drawn through them to dilute the mixture until it loses its ability to explode. Soldered joints are especially liable to this trouble, and with them it will sometimes be found necessary to take the pipe down to locate the difficulty, as with the engine standing still and the pipe bolted in place the looseness will not show.

## CONTINENTAL NOTES.

### The Ostend Automobile Week.

The definite programme for the automobile meeting at Ostend, organised by the Automobile Clubs of Flanders and Antwerp, has just been issued. The "week" will open on July 13th, when the competing cars will be officially weighed. The morning of Saturday, July 14th, will be devoted to a series of flying kilometre speed trials for racing and touring cars on the Ostend-Snaeskerke road, and in the afternoon a similar series of tests over a mile course from a standing start will be held. An excursion to Bruges will form the programme on the 15th, while on the 16th both racing and touring vehicles will participate in a five-kilometre speed contest. On the 17th the touring cars will take part in a reliability run over a round circuit, which, starting and finishing at Ostend, takes in Blankenberghe, Bruges, Roxem, West Kerke, and Snaeskerke. The meeting will end on July 18th with a balloon chase organised in conjunction with the Aeronautic Section of the Namur and Luxembourg Automobile Club. Entries for the meeting should be sent before July 2nd to M. T. Ratineckx, 40, Grande Place, Antwerp, from whom full particulars can be obtained.

kilometre hill climb for tourists is to be held on the Tingry Hill at Samer, about twelve miles from Boulogne.

### The Gordon Bennett Race.

A meeting of representatives of the recognised national automobile clubs was held at Pont de Genes (Sarthe) on Monday to consider the proposals of the A.C.G.B.I. with regard to the continuance of the Gordon Bennett Cup race, but after a long discussion it was resolved to postpone action until the annual meeting of delegates at Paris in December. From this it is apparent that there will be no cup contest in 1907.

### Public Services in Germany.

Plans are in progress for the establishment of public motor-car services between Eidelstedt and Hamburg and between Bayrischzell and Bad Kreuth. A company has also just been formed in Cronberg to inaugurate a service between that town and Konigstein.

### The Automobile Movement in Denmark.

With the view of popularising the automobile in Denmark, demonstrations are being organised in different parts of the country to enable agriculturists to accustom their horses to

Bougier at the wheel of his De Dietrich Racer.

### The Spa Automobile Meeting.

Arrangements are well in hand for the automobile meeting which is to be held at Spa from July 20th to 27th. The first five days will be devoted to the Criterium de Regularité, the run on the 20th being from Spa to Nimegen, on the 21st from Nimegen to Bonn, on the 22nd from Bonn to Luxemburg, on the 23rd from Luxemburg to Rheims, and on the 24th from Rheims to Dinant. On July 25th there will be a 250-mile race on the Meuse circuit; on the 26th a 5-kilometre hill-climbing contest at Spa, and on the 27th a gymkhana at La Sauvenière, Spa.

### An Automobile Fete at Boulogne.

The Boulogne-sur-Mer section of the Automobile Club du Nord de la France is organising a motor fete for the 19th and 20th July next. On the first day there will be a gymkhana and a procession of the competing cars along the Boulevard Sainte Beuve, and an elegance competition. On Friday, July 20th, the first event will be a kilometre hill climb for touring cars in the Forêt de Boulogne, followed by one of 500 metres for racers and a kilometre speed trial on the level. In the afternoon a

motor-cars. A meeting of this kind was recently held at Frederikavark, in North Zealand, when a large number of local landowners and farmers took advantage of the opportunity of giving their animals a closer acquaintance with the motor-vehicle.

### Miscellaneous Items.

The French Automobile Club has decided to organise a trial of industrial vehicles next year.—The Automobile Club of Russia has just moved into its new headquarters at 15, Rue Spalernaia, St. Petersburg. In addition to the club rooms, the new premises, which have been specially built, comprise a garage and a repair shop.—Three Mercedes cars have been entered for the Vanderbilt Cup race.—Messrs. Thomas Cook and Sons are now employing a N.A.G. 24-26-h.p. twenty-two-seated char-a-banc for sight-seeing purposes in Berlin.—La Société Mors are about to considerably extend their works at Grenelle, Paris.

THE Automobile Association of Bengal intends to organise a motor-car exhibition in Calcutta in January next.

## SOME CURRENT TOPICS.

### A Novel Dust Screen.

Dr. J. F. Walker, of Swallowfield, Reading, has kindly sent us some photographs of the dust screen he has designed for use with his 12-h.p. Darracq, which has a back entrance tonneau body. The first picture shows the screen in ordinary use, and in the second one the device is seen elevated to allow access to the tonneau. The screen is made up of an iron frame fitted on a pivot to the sides of the car, with a jointed arm on each side which straightens out rigid to keep the screen up when getting into the car. This screen, of course, could be used with a side-entrance body, where a Cape cart hood is not employed. Dr. Walker informs us that he has had the arrangement in regular service for some time, and finds it most efficacious in keeping dust out of the tonneau.

### A Glass-Insulated, Sparking Plug.

Portable Accumulators, Ltd., have sent us a sample of a somewhat novel form of sparking plug, known as the "I. C. U." they are putting on the market. The feature of the device is

like an ordinary gas flame. Thus any variations or irregularities in the operation of the carburettor are at once made as apparent as are those of the induction coil or ignition system. We hope shortly to try the new plug.

### The Capacity of Accumulators.

In the new catalogue lately issued by Messrs. Peto and Radford some useful information with regard to ignition accumulators is given, from which we take the following:—"The term 'capacity of accumulators' is the number of ampere hours they will give, when discharging at certain rates of current discharge. An accumulator which has a capacity of twenty ampere hours at one ampere discharge would not have so large a capacity at three amperes rate, so that it is necessary to consider the rate of discharge when taking capacity into consideration. The capacity of an accumulator will, moreover, be much greater when the discharge of current takes place with intervals of rest, as this allows the acid around the plates to become equally distributed again, the acid in the pores of the plates being weaker on discharge." In their list Messrs. Peto and Radford give two values for the capacity of accumulators which are used for ignition purposes, one being the maximum capacity at a low rate of continuous current discharge, the other being the maximum capacity at an intermittent rate of discharge. "When an accumulator is tested for capacity at a certain rate of

Dr. Walker's 12-h.p. Darracq fitted with novel Dust Screen.

that, in place of porcelain or mica, the insulating medium consists of a specially treated fireproof glass of great mechanical strength, capable of resisting high pressures and extreme changes of temperature. The advantages of glass as an electrical insulator are well known; it is claimed to be superior to porcelain, soapstone, mica, and other similar substances hitherto used, as, being of a homogeneous nature and a vitreous substance, there are no flaws or interstices through which the high tension current can leak to earth unseen. The insulator is made in the form of a cylinder, open at the upper end and closed at the other. The central wire is hermetically sealed into the latter, and therefore cannot work loose and cause leakage. The following advantages are claimed for the plug:—(1) It provides an observation window through which all the phenomena occurring within the cylinder may be seen. (2) It permits one to see if the spark is taking place under the normal working compression, it being well known that a spark that will pass in air may be too weak to pass when under the normal compression. (3) It enables the action of the carburettor to be estimated, as the colour of the flame during explosion varies with the proportion of gas and air admitted to the cylinder. If the mixture is at its best the colour of the explosion will appear blue, somewhat resembling a Bunsen burner flame, while if too rich a mixture is being used the flame will appear a brilliant orange colour,

current, readings are taken until the voltage of one cell has fallen below 1.8 volts, and is taken as the full capacity. But the reason why the voltage has fallen to 1.8 volts is that the acid in the pores of the plate, and closely contiguous to the plate, has fallen in gravity, whilst the outside surface of the plate has become discharged. But if an interval of time is allowed for the acid to mix with that in the surrounding space, and for the surface of plate to receive more charge from the interior (speaking untechnically) it will then be found that more current can be taken at a voltage above 1.9 and the capacity value increased. In all forms of portable batteries the current is generally taken from the cells in periods of time with a rest, therefore the capacity is based upon this method, in order that users may know the utmost the cells will do under the best conditions, saving the need to buy a larger size than may be necessary for the purpose required. For continuous current discharge at high rates of current these capacities would not be obtained, and larger sizes should be allowed for."

MESSRS. J. W. BROOKE AND CO., LTD., of Lowestoft, have sent us a photograph of a 30 ft. motor launch they have just delivered to the "Midnight Sun," for service in Norway. The engine is of the Brooke standard 45-h.p. type, and on its trial the boat attained a speed of fourteen knots.

MESSRS. S. SMITH AND SON have just been honoured by the Royal Warrant for their speedometers.

ON Wednesday last week the members of the Society of Engineers paid a visit of inspection to the Iris Motor-Car Works of Messrs. Legros and Knowles at Willesden Junction.

THE membership of the Automobile Association has now got beyond four figures.

THE EARL OF ABERDEEN, P.C., has been elected a vice-president of the Motor Union of Great Britain and Ireland.

LARGER premises have been taken in Rock Street, Bury, by Messrs. Carr and Co., who now have a garage for motor-cars.

A DEPOT for the sale of the new Arrol-Johnston cars is about to be opened in Princess Street, Hanover Square, London, W.

WE hear that Mr. E. A. Greathed has resigned the position of Assistant-Secretary of the Automobile Club of Great Britain and Ireland.

THE municipal authorities of Nelson, Lancashire, have ordered a 5-ton steam tipping wagon from the St. Pancras Ironwork Company, Ltd.

THE sizes of the Stepney spare motor wheels which Messrs. Davies Bros. supply from stock will be given every week in their advertisement in the *M.C.J.*

RECENTLY the secretary of the A.C.G.B.I. circularised the makers of steam cars, asking if they would be willing to enter cars for a race for steam vehicles only. Only three replies have been received—all in the negative.

THE London County Council has again changed the form of driving licences; they are smaller than the previous series, are arranged to last for three years in place of two, while the number of pages allotted for particulars of endorsements is not so liberal as formerly.

THE new Arrol-Johnston 12-15-h.p. motor launches, built to the order of the Fylde Motor Service Company, Ltd., Bispham, near Blackpool, have now been launched, and have been found to be satisfactory in all respects. The boats are capable of running at a speed of eight knots.

WHEN in Blackpool recently, we called in at the Central Motor Garage, in Abingdon Street. In view of the steady growth of the business, the new proprietors, Messrs. Jackson Bros., are increasing their garage accommodation, and are installing a car lift to give communication to the upper floor. The repairing plant has also been extended by the addition of several new machine tools and a tyre vulcaniser. Messrs. Jackson have also opened a branch garage in Eaves Street, Blackpool, at the rear of the Imperial Hydro.

MESSRS. PETO AND RADFORD, LTD., are removing their sales depot and re-charging department from 57B, Hatton Garden, to larger and more commodious premises at 100, Hatton Garden, close to Holborn Circus, E.C. As they have been established for seventeen years at the former address, they are particularly anxious that the numerous motorists who drive to their place may be spared the trouble of looking for the firm at the wrong end of Hatton Garden. The new premises are close to those of Gamages, Ltd.

THE latest illustrated trade catalogue issued by Mr. G. Goldschmidt, of 323, Green Lanes, Finsbury Park, N., is a very comprehensive list of the many useful accessories handled by that well-known factor. These include the "Imperator" non-skid, which is made up of a foundation of vulcanised canvas covered by a moulded leather protector. To this an outer band is attached by means of studs riveted with washers. The "Imperator" headlights, the Zanardini lamps, the "Glaria" lamp, and several other illuminating agents are illustrated and described. The motor horn section is equally exhaustive, the devices shown including "La Magissante" and Goldschmidt's French Octopus, which secures a powerful and long tone. Jacks, lamp brackets, goggles, &c., complete the selection of accessories mentioned in the list.

## HERE AND THERE.

THE MARQUIS OF BAT- has purchased a 28-h.p. Daimler-car.

THE officials in the Land's End to John o' Groat's used an 8-h.p. Wolseley car lent them by the Wolseley Company. The

vehicle went right through the arduous course with three passengers without trouble.

THE Doncaster Rural District Council is calling the attention of the County Council to the deep ruts made in the highways of the district by motor-car traffic.

THE G.P.O. has just invited tenders for the conveyance by motor vehicles of the night mails between London and Colchester, London and Ipswich, and Southend and Chelmsford.

THE value of the motor-cars and parts exported from the United States during April last is returned at £81,666, as compared with only £47,492 in the corresponding month of 1905.

LA Compagnie des Tramways Bruxellois, of Brussels, has placed an order for a 30-35-h.p. Metallurgique car for the use of its line inspectors. The same company has also ordered a motor-tower wagon from the Metallurgique concern.

THE Motoring Annual for the current year, edited by Messrs. N. B. and E. Kenealy, is an encyclopædia of the year's automobilism, and also a "Who's Who" so far as the motor world is concerned. Its main-features are familiar to motorists.

The Inauguration of the Service of Orion 'Buses' at Nevin, North Wales. (See page 408.)

A NEW building is being erected in Wardour Street, W.C., by Messrs. Mitchell Motors. It will have an area of 18,000 sq. ft., and will provide the West End with a new garage of good capacity. The firm will also place a new motor-cab on the market.

To a series of pretty stories and funny pictures, for which Mr. Archibald Williams and Mr. A. Wallis are responsible, the title of "Petrol Peter" has been given. The book, illustrated in colours and written in rhyme, has been published by Messrs. Methuen and Co., and should prove useful in whiling away hours which, but for "Petrol Peter," might drag somewhat.

THERE is a decidedly gasoline odour—as they would say in America—about "The Motor-car Divorce" which Messrs. Duckworth and Co. have published. It is written by Mrs. L. C. Hale, and illustrated with drawings by Mr. Walter Hale. It will prove a volume of pleasant reading to motorists when touring on the Continent.

AT the Garden City estate at Letchworth matters are developing rapidly, and the efforts of the promoters to attract industries are meeting with success. At the Station Hotel, near the railway station, a motor garage with inspection pit has been opened, and petrol can be obtained at all hours. This is in the centre of the estate, and overlooks the new Howard Park.

THE United States Senate has passed the bill for duty-free alcohol for industrial purposes.

A POSITION at Phyllis Court will be again reserved at Henley for members of the A.C.G.B.I.

AT Harker's Hotel, St. Helen's Square, York, an examination for A.C.G.B.I. certificates will be held on the 6th prox.

THE Westminster Motor Works, Ltd., despatched one of their Thor 10-h.p. four-cylinder cars to Colombo, Ceylon, a few days ago.

AT the recent Bath and West and Southern Counties Agricultural Society's Show at Swindon the Swindon Motor Engineering Company exhibited a number of Wolseley, Siddeley, and Peugeot cars.

MESSRS. LAMB BROTHERS AND GARNETT have discontinued the sale of the L.B.G. or one-year sparking plug, which has been on the market for the last two or three years, and are introducing a new type of plug.

IN proposing the toast of "Success to the Society," at the luncheon at the Northampton Agricultural Show, at Kettering, the Duke of Grafton said he was in his eighty-fifth year, and had that day done what he said he would never do—ridden in a motor-car.

THE accompanying illustrations show the new electric horn recently introduced into this country by Messrs. Gauthier and Co. The Electrophone, as it is called, is of simple and strong construction, a push button taking the place of the rather uncertain bulb fitted to the usual pattern of motor-horns. The parts consist of a push-button switch and battery, and in the horn is embodied a vibrator of special construction, connected up to the battery, as shown in the

second illustration. The horn is fitted preferably to the dashboard of the car, behind which the battery is fixed, while the button can be placed on the steering wheel or column. The driver can obtain intermittent or continuous sounds distinctive and sonorous, as we have found by experiment, and, if desired, the small amount of electric power required can be drawn from the ordinary ignition accumulators, a pressure of six volts being, however, usually required. The horn is supplied complete with one dry battery, five yards of insulated cable, and interrupter button.

MESSRS. WEST, LTD., are, we learn, exporting quite a large number of the West chassis to their Italian agents, Messrs. Ninci and Graziani, of Bologna.

THE Zenith (Motor) Engineering Company, 101A, Stroud Green Road, Finsbury Park, N., have a City office at 4, New London Street, E.C., where the Zenith bi-car may be seen. This is fitted with a 3-h.p. Fafnir engine. The framework consists of an independent upper and a lower frame which are connected only at either end. Together they form a spring which absorbs all the ordinary vibration. In turning the base of the wheel goes outside the centre line of the machine, thus minimising side slip. By the peculiar system of construction front forks are dispensed with. The steering is effected by means of connecting rods fixed on the ends of the axle and bar at the bottom of the steering pillar. The machine is also characterised by being built very low, while the provision of a free engine and clutch enable the bi-car to be started with a handle. The Zenith tri-car is another popular machine fitted with a 4-h.p. engine and two-speed gear, while the Zenith "tri-car de luxe" has a 5-h.p. twin-cylinder engine, and presents a machine that is attaining wide popularity.

GARAGE accommodation is now provided at the Callander and Trossachs hydropathic establishment at Callander.

A TEST of six White steam cars as vehicles for hire was recently made in Osaka, Japan, by the Osaka Automobile Company.

THE Technical Instruction Committee of Pembroke Technical Schools, Dublin, has decided to purchase a 15-h.p. four-cylinder car, subject to the sanction of the Department of Agriculture and Technical Instruction for Ireland.

WE learn from Bombay that it is intended to hold the Poona Motor Trials for the Aga Khan Challenge Cup in the early part of July instead of in September. The cup was won last year by a Wolseley car driven by Lieut. Jenkins.

ONE peculiarity about leather clothing, says the "Leather Trades' Review," is that it does not keep out the cold; the air simply whistles through it, and it is safe to say that the coldest person in a car on a winter's day is the man who looks the warmest.

A RECENT run on a savings bank at Painesville, Ohio, was promptly stopped by means of the motor-car. The run started at 9 a.m., and the officials immediately telephoned to the First National Bank of Cleveland for assistance. Bags of money aggregating £20,000 were loaded into a motor-car, and the journey was made in fifty-five minutes. Supplies also came from other quarters, but the speedy automobile was an easy first.

CALLING in at the depot of Messrs. J. Keele and Co., in Brook Street, London, W., we had an opportunity of inspecting a 20-32-h.p. Darracq car with double landaulet, which has just been delivered to Mr. Julius Berlein. They have also recently supplied a 10-h.p. Darracq landaulet to Dr. McNaughton Jones for professional use. Messrs. Keele are now making a special feature of overhauling and repairing cars, Lord Castletown's 20-h.p. Spyker being among the vehicles which have lately passed through this department.

THE police have determined to appeal against the decision of the Croydon magistrates in dismissing the charge against Mr. Little for obstructing the police. The facts of the case, previously reported in the *M.C.J.*, were that Mr. Little, who is not a motorist, simply gave warning to drivers of cars about a certain stretch of road that was being timed by the police with a view to prosecutions, whereupon the police summoned him for obstruction. The defence of the case was undertaken by the Motor Union, and was successful.

FROM Messrs. Newell Bros., Grosvenor Terrace, Camberwell, S.E., we have received a sample bottle of a new preparation, known as "Carfume," they have lately introduced. It is intended as an addition to engine lubricating oil, with the object, as the name implies, of overcoming the objectionable odour due to over lubrication. It is mixed with the oil in the proportion of 1 to 15, and it is claimed that by its use any fumes which the engine may give off have an odour which is rather pleasing than otherwise, both to motorists and to the general public. Messrs. Newell also state that "Carfume" assists in the perfect combustion of the mixture in the cylinder.

AT Ayr Sheriff Court, Mr. Alexander Craig, of Coventry, was charged with having, on April 16th, driven a motor-car through Colmonell village at a speed exceeding ten miles an hour. A police officer stated that he had had a complaint about the rate at which this car was travelling from Mr. Cathcart Wason, M.P., who resided in the district. Several witnesses estimated the speed at which the vehicle was running at twenty miles an hour. Accused said he had had a tour from Coventry through Scotland, and his average speed was eighteen miles an hour. He was aware of the speed limits in Ayrshire, and recollected at Colmonell saying to a lady in the car, "Thank goodness, this is the last of the speed limits." He was certain that he did not go beyond the ten miles, and he believed he was considerably under it. The complaint had evidently originated with Mr. Cathcart Wason, M.P., who was notorious for his bigoted intolerance of anything connected with motors and motorists. Sheriff Shairp found the charge proved, and imposed a penalty of three guineas.

## CORRESPONDENCE

[Letters to the Editor should be addressed to the offices,  
27-33, Charing Cross Road, W.C.]

### TYRE PROTECTORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Which is the best tyre protector? I have tried the Otto on one car, the Grose on another, and have Desclee non-skids on a third. The cemented leather bands with three rows of studs come loose in time, they heat the rubber cover and wear it into holes, the perished rubber accumulates in lumps, and the leather protector bursts. I thought the Desclee non-skids were a great improvement. I have run mine 2,000 miles without a puncture and the tyre covers are not damaged, but the plates are falling off and the smooth steel treads do not get the same grip of the roads as do the rivets. Then, I am told that the system of attaching these non-skids by hooks to the rim allows the wet to get at the head of the cover and causes the tyre to perish.

Why should these non-skids be attached to the rim? Is it not possible to attach them to the wheel itself independently of the rim, which should take the tyre only? Could the tread also be made of cotton belting instead of armoured leather? I have found the ordinary red cotton or canvas belting to last six times longer than the best leather on motor-car brakes, and I am persuaded that this material would make a splendid tread for a tyre protector. Has it been tried?

I would not drive a car again with plain tyres over limestone roads and wet tram lines, and I believe in protecting the cover and inner tube (the vital parts) from punctures. I have never had a puncture either on my car fitted with Grose bands—a 24-36-h.p. Fiat bought in 1904—or on my car fitted with Desclee non-skids, which, as mentioned above, has done 2,000 miles, but the former (on all four wheels) are becoming lumpy and the latter (driving wheels only) are shedding the plates. The unprotected front wheels (Dunlop non-skids) are badly cut with flints. I drew out one evening from one of the driving wheels a large horse nail which had penetrated the leather and the Dunlop non-skid cover below, but had not, fortunately, penetrated the tube. With any other non-skid this nail would have punctured. If the Desclee bands could be fastened to the wheel outside the rim on bolts or hooks attached to the wood rim and quite independent of the tyre rim, the wet would not penetrate and damage the rubber and canvas of the tyre proper. A strip of thin leather should also be introduced to prevent the rivets boring into the rubber of the tyre. These rivets become hot and bore holes in the rubber. The strip of leather would prevent this. A football stands a good deal of violence and the delicate rubber bladder is the life of the ball, but all the hard knocks are taken by the leather covering. I feel sure that there is a splendid opening for a leather or other protector to fit on the outside of the rim by means of buttons, bolts or hooks, the flaps being slotted and easily slipped when the tyre is deflated, but tight and secure when the tyre is inflated.—Yours truly,

C. D. LENG.

### THE L.C.C. "BUSINESS" METHODS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Upwards of a week ago I applied to the L.C.C. for a driving licence. After three or four days I had a form returned to be filled in. This was duly filled in and returned. After a further delay of three days I sent a messenger down to the offices at 3 p.m. After a great deal of difficulty he at last found somebody to attend to him, and was then informed that the letters arriving by that morning's post had not yet been opened.

After being detained upwards of two hours, he eventually succeeded in obtaining the licence. I am troubling you with these details just to show you how the public officials carry out their duties.

The poor ratepayer is evidently quite a secondary consideration with these individuals.—Yours truly,

FAUTEIL.

[Recently we referred to the dilatory methods in the office of the L.C.C., and also the needless ascending and descending of the lift necessary after the attention of the officials has been secured.]

### AN UNUSUAL IGNITION TROUBLE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The following trouble may be a warning to many, and also may interest some of the readers of your valuable paper. A friend of mine in this district has a large motor-car and I always drive it for him. It has high tension magneto ignition, the coil of which is on the dashboard. The other day he bought a new dash-board clock and fitted it himself by screwing it on to the coil case with  $\frac{1}{4}$  in. screws which went right through into the condenser of the coil. The other day we started out on a journey and the car ran beautifully up to its best form for about three miles, when, without any warning, all firing stopped and the engine came to a standstill. I got out and examined everything as far as I could, in-

cluding the platinum points on the contact breaker of the magneto, but could find nothing wrong. I could not, however, get the magneto to act, and fortunately we had reserve battery and coil ignition, which I switched on to, and drove to a motor shop in Clonmel, co. Tipperary. After another long examination we finally took off the coil and opened it up to see if the screws by which the clock was held on had gone into its vitals, and found, as I mentioned before, that three of them had gone through part of the condenser. Can you or any of your readers tell me if this is the probable cause of the complete breakdown in the magneto, and if so, why was it so sudden and without warning, and why did the car run even three miles so well without a misfire? I should have thought myself that if these screws were the cause of the trouble, the magneto should never have worked after they were put in. I may mention the clock is one of the usual brass ones.—Yours truly,

T. W. N. QUINN.

### CLEANING RADIATORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to Mr. J. Tribe's letter with regard to cleaning radiators, in the last issue of the *M.C.J.*, I have rendered assistance to a large number of my friends by giving them directions how to clean the radiators by means of a solution which is harmless to all kinds of metals, rubber, &c. If Mr. Tribe will communicate with me at Marieberg, Mansel Road, Small Heath, Birmingham, I will give him full instructions, so that he will be able to tell his friends.—Yours truly,

ARTHUR BURGESS.

Miss Muriel Hind on her 6-h.p. Singer Tri-car.

In addition to being one of the few successful tri-carists to complete the journey from London to Edinburgh within the 24 hours in the recent run of the Motor Cycling Club, Miss Hind also succeeded in getting through in the Land's End to John o' Groat's Six Days' Reliability Trial of the A.C.C. The latter performance was a particularly plucky effort, and says much for the endurance of Miss Hind and her lady passenger, as well as for the qualities of the Singer machine.

### TROUBLE WITH DE-DION ENGINE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I had an 8-h.p. De Dion car two years ago which behaved precisely as your correspondent CR 328 describes. It usually (but not always) took from five to ten minutes to start, and sometimes would not start at all. No ingenuity of the best experts could discover the cause of failure, but I fancy it was in the carburettor and ignition combined. I took the car to the De Dion firm to be overhauled, and their own workmen were about fifteen minutes starting the engine after putting it in perfect order! I eventually sold the car for scrap iron. My present car, a Panhard, starts at first turn of the handle; it has a Krebs carburettor. I believe this is unique.—Yours truly,

C. N. R. WHEATLEY.

### SOLID TYRES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be pleased if you or any reader will give me their experience and advice in the use of solid tyres for the rear wheels of small motor-cars in place of pneumatics already fitted. I have a 6 $\frac{1}{2}$ -h.p. Wolseley single-cylinder two-seated car weighing about 12 cwt. unloaded, and having a chain-driven live axle. The roads in my district are very flinty. I have worn and cut to pieces in a few months a pair of tyres by a leading maker, fitted with non-detachable steel-studded non-

skids. I have now in use a pair of rubber tyres which I have used only about two months, and they are cut in many places nearly to the fabric. When I have a puncture I do not find it out until I have run the deflated tyre some considerable distance, so little is the extra vibration, with the result that the fabric gets strained and the inner tube cut and abraded. I should like to know if solid tyres could be fitted to the present beaded rims, what make you would recommend, and any other information to enable me to decide on the advisability of changing to solids.—Yours truly,

W. J. A.

## STEAM CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to your correspondent A. T., whose letter appears in the issue of the *M.C.J.* of the 16th inst., such a gear arrangement as he suggests is not at all necessary, as the amount of water supplied to the boiler can be easily graduated by means of the valve, which should be fixed within easy access of the driver's seat, and is so in all steam cars that we have had to do with.—Yours truly,

THE WATFORD ENGINEERING WORKS.

## FOUR v. SIX CYLINDERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As you published in the *M.C.J.* of the 16th inst. the extract from an American motor paper I sent you giving the opinion of Mr. E. R. Thomas on the question of four v. six cylinders, you may think well to find room for the view of Mr. Henry Ford, of the Ford Motor

spaces, pistons and other parts also must be larger. Consequently, the six-cylinder motor is 25 to 30 lbs. lighter than the four-cylinder of the same power. An even more convincing demonstration would be to weigh a six-cylinder motor on the same scale as a four-cylinder of the same capacity.—Yours truly,

R. E. ECCLES.

## A WARNING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I wish to warn drivers advertising in your pages against a man who sometimes answers advertisements, saying that he has been sent by the manager of the Central Garage, Brondesbury Station. He then asks for 2s. to send a telegram to the manager of the garage giving full particulars as to capabilities, etc., as he would not be back at the garage before closing time.

He is a man between 25 and 30 years of age, height about 5 ft. 5 in. He is rather full in the face, with fair moustache. It was getting dark when I saw him, and he had been to my lodgings once before in the day while I was out. Trusting you will be able to give this warning for the benefit of others.—Yours truly,

A. E.

## A NOVEL DESIGN OF PETROL MOTOR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be glad if you or any of your readers could give me any information upon the following point. What h.p. might I expect to obtain from a petrol engine having three pistons, 80 mm. diameter by 90 mm. stroke? The centre line of each piston makes an angle of 120 deg. with each other, and are driven outwards at the same time by the explosion in the combustion chamber in the centre, the connect-

The Inter-Club Meet at Buxton. (See page 402.)

Company, on the same subject, which I take from a New York journal I received to-day:—

Mr. Ford remarks that "the six-cylinder motor not only is no heavier than the four-cylinder one of the same power, but, on the contrary, is even somewhat lighter. Without authentic tests at hand, the only way to compare the powers is to compare the piston displacement of each. Compression and speed being equal, the difference between the two will be so slight that it may be considered a negligible quantity. The six-cylinder Ford motor is rated at 40-h.p. The cylinder dimensions are  $4\frac{1}{2}$  by  $4\frac{1}{2}$  in. bore and stroke respectively. The total piston displacement in the six cylinders is therefore 360.5 cubic inches respectively. A four-cylinder motor of the above dimensions would ordinarily have a flywheel of 20 in. diameter and weighing not less than 140 lbs. The six-cylinder has a 16 in. flywheel weighing 65 lbs. By increasing the diameter to 20 in. the flywheel need only weigh 50 lbs., or 37 lbs. if the diameter were 24 in., the usual size in single-cylinder motors. In short, the weight may be decreased to any desired amount by increasing the diameter. That the six-cylinder motor of same total piston displacement is lighter than the four of the same power is shown by the following:—The two extra cylinders in the Ford weigh with valves and all attachments exactly 56 lbs. Two extra pistons and connecting rods complete, 17 lb. The additional length of crank shaft and aluminium base chamber is exactly compensated for by the necessarily larger diameter of parts in the four with its large bore and longer stroke. We then have 73 lbs. of extra weight due to the addition of the two cylinders, which is, however, offset by 75 lbs. reduction in the flywheel weight necessary for type of motor. This leaves an advantage of 2 lbs. for the six-cylinder. But the larger cylinders necessary to produce the same power in four that we get from six would weigh fully 25 per cent. more each than the smaller ones—they must not only be larger, but the walls, water jacket

ing rods and cranks being reversed to the Brotherhood three-cylinder steam engine, and are kept in uniform relation to each other by pinions on the crank shafts gearing with large wheel having a multiple of teeth, 8 to 1; ordinary Otto cycle movement, M.O. valves, water-cooled. What disadvantages are likely with this type of engine, the idea being to get a balanced motor?—Yours truly,

S. J. S.

[The question raised by our correspondent seems to be entirely a matter for the inventor. In the first instance, the question of horse power cannot be figured out according to formula, as there are frictional losses to be taken into consideration, occasioned by the introduction of the gears. Then, as regards balance, this appears to be far from perfect, as by the force of the explosions exerted on the three pistons at once there is an idle revolution and a half, which would at once cause a pendulum motion on the engine. It would appear, therefore, that the balance would not be so perfect as in the ordinary four-cylinder engine, but, as above mentioned, it must be purely an experiment on the inventor's part to obtain good results.]

CAR WANTED.—A correspondent wishes to have specification of an 8-h.p. car with tonneau body which he has seen listed at about £100.

THE DUBRULLE LUBRICATOR.—In reply to "Oiler's" query in the last issue as to where he can get a Dubrulle lubricator repaired in England, Mr. Alan Hickman, of Birmingham, writes:—"I am happy to be able to inform him that he can get this job done by the Brighton and Sussex Motor and Carriage Works, at the Grand Hotel Garage, 13A, Cannon Place, Brighton, Sussex. I have myself had a Dubrulle lubricator repaired at their establishment." On the other hand, United Motor Industries, Ltd., write that—"Dubrulle lubricators, we find, can only be successfully repaired at Dubrulle's works, and we shall be pleased to forward them for your correspondent, and will get earliest possible attention."

## CLUBS AND ASSOCIATIONS.

### AUTO-CYCLE CLUB.

THE judges appointed by the Auto-Cycle Club have recommended the committee of the club to award gold medals as follows:—Motor-bicycles: 3½-h.p. Quadrant, A. B. Albert; 3½-h.p. Quadrant, W. Harrison; 3½-h.p. Quadrant, A. Williams; 5-h.p. Vindec Special, W. H. Wells; 5-h.p. Vindec Special, T. Woodman; 2½-h.p. De Dion, H. G. Cove; 4-h.p. Werner, H. E. Blackeney; 3-h.p. Triumph, B. H. Davies; 3½-h.p. Matchless, J. Tassell; 4-h.p. Werner, F. W. Ashworth; 3-h.p. Triumph, F. Hulbert; 3-h.p. Triumph, S. Bramley-Moore; 3½-h.p. Brough, W. Brough; 3½-h.p. Brown, R. M. Brice; 2½-h.p. Phellon-Moore, W. Milnes; 3½-h.p. Phellon-Moore, R. Moore; 3½-h.p. N.S.U., S. W. Carty; 3-h.p. Triumph, H. Cooper; 7-h.p. Lurquin-Coudert, A. W. Browne; 3-h.p. Fafnir, D. Poupert; 5-h.p. Rex, W. Hayes; 3½-h.p. Quadrant, G. W. Blackaller. Tri-cars: 6-h.p. Quadrant carette, H. G. Priest; 10-h.p. Lagonda, Wilbur Gunn; 9-h.p. Riley, A. Carpmael.

### HERTFORDSHIRE.

THE third annual open hill climb up Aston Hill, near Tring, will be held by the Hertfordshire County Automobile Club to-day (Saturday). The event is a handicap, the winner to receive a trophy. A special prize is awarded to the car making fastest time up the hill. Mr. E. T. Pryor has presented a £10 10s. challenge cup, to be known as the Aston Challenge Cup, to the car belonging to a member of the club unconnected with the trade who makes the most meritorious performance up the hill. The weighing in takes place at Boxmoor Station, L. and N.W. Railway, from 11 a.m. to 2 p.m. The first car will be sent up the hill at 3 p.m. Aston Hill is on the Wendover road, between Tring and Aston Clinton, on the Aylesbury road. Motorists coming from London take the first turn to the left after reaching the top of the Chiltern Hills. The descent must be taken slowly, otherwise the turn, which is half way down, will be missed. The hill is about one and a half miles from the turn.

### LINCOLNSHIRE.

ANOTHER very successful meet of the Lincolnshire Automobile Club was held at Crowland on Saturday, the members being again splendidly entertained by Dr. and Mrs. Husband. After an inspection of the beautiful Abbey, dating from 716, and the peculiar and ancient bridge, the members were invited to inspect a "museum." This was found to contain the doctor's gig, now rendered obsolete, for he has long been a motorist, and uses a 14-h.p. Spyker and a 6-h.p. De Dion, his one-time stable being now an up-to-date garage. Among those present were Mr. A. A. Padley, Market Rasen, and Major J. A. Cole, J.P., chairman, 16-20-h.p. Humber; Mr. Linnell, Market Deeping, Mr. Tomlinson, Sleaford, 10-12-h.p. Coventry Humber; Dr. Gilpin, Bourne, 12-h.p. Richard; Mr. C. W. Pennell, Mr. W. R. Pennell, Mr. Godfrey Lowe (hon. sec.), 16-h.p. Martini; Mr. W. B. Parish, Horncastle, 6-h.p. Rover; Mr. W. B. Chapman, Horncastle, 8-h.p. De Dion; Dr. Miller, Wrangle, 8-h.p. Peugeot; Mr. F. Clark, Lincoln, 15-h.p. Panhard; Dr. Benson, Mr. F. H. Hutton, Market Deeping, 6-h.p. Humber; Mr. Gibson, Bourne, 12-h.p. Richard; Rev. T. A. Stoodley, Dowsby, 8-h.p. De Dion; Rev. M. C. Wilkin, Wainfleet, 10-12-h.p. Argyll; Mr. Wadsley, Bourne, Orient Buckboard; Mr. T. W. Mays, Bourne, 15-h.p. De Dion; Mr. Cook, Boston, 13½-h.p. Minerva tri-car, and Dr. Sharp, Brant Broughton, 12-h.p. Richardson. The committee held a meeting, and decided the formula for their hill climb at Cawwell on July 12th, also the regulations, and both these will be sent round to the members. It was decided to hold the race on Mablethorpe Sands on July 21st, under the closed competition rules of the A.C.G.B.I. The invitation of Sir John Thorold for a meet at Syston Park and a hill climb was accepted, and August 12th provisionally fixed. Mr. Dobson, of Cawwell House, who is to entertain the club at the hill climb there, was elected an honorary member.

### THE MOTOR UNION.

THE June meeting of the General Committee of the Motor Union was largely attended. Representatives of the A.C.G.B.I. and of twenty-one provincial clubs were present. It was reported that the Automobile Club of Great Britain and Ireland had made a contribution of £200 towards the Union's Defence Fund. It was resolved to contribute towards the tarring of the road at Dunton Green, on the London-Hastings road. A draft letter to manufacturers on the subject of exhaust cut-outs was authorised to be sent. Legal assistance was voted in several instances to members of the Union. It was also resolved to prosecute in the case of one of its members who was assaulted by the driver of a cart. A successful prosecution for obstruction on the highway was reported, and it was resolved that any cases of assault or obstruction on the highway communicated to the Secretary of the

Union, 1, Albemarle Street, London, W., would be at once investigated with a view to proceedings being taken.

### NORTH-EAST LANCASHIRE.

THE members of the North-East Lancashire Automobile Club were entertained to a garden party by Mr. T. E. Higham, at his residence at Chadswell, recently. In all about fifty motor-cars made the journey. Unfortunately the weather was rather chilly, and on the way through Worston the motorists found the roads in wretched condition. Tea was served on the lawn, and the guests spent a pleasant time, Mr. George Thornton's orchestra discoursing excellent music at one end of the garden.

### KENT.

ONCE again the members of the Kent Automobile Club were most hospitably entertained by Mr. and Mrs. Austin at their charming home at West Court, Detling. Over fifty members and friends were present and all thoroughly enjoyed themselves. Members are reminded that the gymkhana takes place at the Athletic Ground, London Road, Maidstone, to-day (Saturday). The competitions start at 2.30 p.m. Lunch at 1 o'clock. Members and their friends will be admitted to the ground free on production of their membership tickets. The band of the 1st V.B. Royal West Kent Regiment will play during the afternoon by permission of Major C. R. Smith.

### NORTH-EASTERN AUTOMOBILE ASSOCIATION.

IN view of the large number of entrants who were unable to be present at the recent hill climb of the North-Eastern Automobile Association, at Ragpath Side, near Lanchester, the event will be re-run on the 7th prox. In all thirteen cars and one motor-cycle took part in the initial effort, and the fastest performance was that of Mr. G. S. Barwick's Daimler, Mr. Leather's 40-h.p. Fiat being second.

### LEICESTERSHIRE.

It has been found inadvisable, owing to the state of the course in Bradgate Park, to hold the proposed speed trials to-day (Saturday). The committee of the Leicestershire Automobile Club have, however, arranged for the gymkhana to take place at Garendon Park, near Loughborough, instead.

Garendon Park is situated about a mile and a half out of Loughborough, and all cars must enter the park by the Thorpe Gate. The best way to the park from Loughborough is by the Ashby road, until just short of the first milestone, where turn right, and straight ahead. Direction cards will be placed at the turning on the day of the gymkhana.

The road behind the sea bank from Sutton-on-Sea to Chapel St. Leonard's, via Anderby, has been declared unfit for motor-cars by local motorists, and members are urgently requested not to use it. The Lindsey County Council has applied to the Local Government Board for this road to be closed to motor-cars. As no roads within the county have yet been officially closed, and as the club is erecting warning-boards on this one, it is hoped to avoid a precedent being established if members

and others will avoid using it. The road is merely a sandy track, and has fifteen gates across it. There is an excellent alternative road, via Huttoft.

### IPSWICH AND EAST SUFFOLK.

ON Saturday a seventy-five mile non-stop run was held under the auspices of the Ipswich and East Suffolk Automobile Club, for the Botwood and Egerton Challenge Bowl. Of eighteen entries, sixteen cars started, and an observer appointed by the club travelled in each car. The winner of the competition was Mr. A. J. Snowden, who drove a 16-h.p. Argyll. Dr. Hossack was a very good second, and he and five others were awarded a silver medal presented by the club. These were Mr. Leon, Mr. J. R. Egerton, Mr. Gordon-Stewart, Dr. Brown, and Dr. Reed Hill. Dr. Moseley and Mr. Q. Vulliamy acted as judges. The cars and owners taking part in the run were as follows:—Mr. A. J. Snowden, 16-h.p. Argyll; Dr. Hossack, 10-h.p. Alldays and Onions; Mr. Leon, 8-h.p. De Dion; Mr. Egerton, 10-h.p. De Dion; Mr. Gordon-Stewart, 14-h.p. Spyker; Dr. Brown, 12-h.p. Hallamshire; Dr. Reed Hill, 6-h.p. De Dion; Mr. List, 8-h.p. De Dion; Mr. Castell, 10-h.p. Clement Talbot; Dr. Staddon, 8-h.p. Darracq; Mr. Laxen, 20-h.p. Clement Talbot; Mr. Scottorn, 12-h.p. Darracq; Mr. G. Leighton, 10-h.p. Motobloc; Mr. G. V. Millbank, 10-12-h.p. Argyll; Mr. W. H. Scottorn, 18-h.p. Belsize.

### LADIES'.

MEMBERS of the Ladies' Automobile Club were on Wednesday invited by Mrs. R. C. Turnor to motor to Binfield Park, Bracknell, Berkshire. This was the second of this year's meets, and many members were present. The band of the 1st Life Guards played during the afternoon. Members are also reminded that the entries for the club gymkhana are closed. The event is open to members and to the sisters and daughters of members. Sir David Salomons and Mr. James Ochs have consented to act as the judges on this occasion, and the president of the club, the Duchess of Sutherland, to distribute the prizes. On the 25th July a meet will take place at Bear Wood, Wokingham, by invitation of Mrs. Walter.

### CANADA.

THE leading city officials, including the mayor, board of aldermen, and the heads of the civic departments, were the guests of the Automobile Club of Canada on its first club run held recently. With the evident intention of showing the officials the unsatisfactory condition of the roads, the route out of town included some thoroughfares that were in bad condition.

AT the British Motor Boat Club's Regatta on the Mersey at the beginning of the month, petrol motors won nine races, and, in each case, the winner used "Shell" motor spirit.

THE subscription of the Irish A.C. is to be raised to three guineas per annum for all members who shall be proposed after July 1st and who reside within a radius of twenty miles from Dublin.

The following ambassadors have accepted honorary membership of the A.C.G.B.I. during their residence in Great Britain:—Senor de Bernabe (Spain), M. Paul Cambon (France), Musurus Pasha (Turkey), Signor Tittoni (Italy), Count Benckendorff (Russia).

UNDER the auspices of the Blackburn and District Motor Cycle Club a 104 miles non-stop run to Kendal took place on Thursday last week.

## HILL CLIMBING CONTESTS.

### ASTON HILL.

THE third annual open hill-climb at Aston, to be held by the Hertfordshire County Automobile Club to-day (Saturday), has produced a total of sixty entries. Aston Hill is on the road between Tring and Wendover, and is the first turn to the left after reaching the top of the Chiltern Hills, before one reaches Aston Clinton. The road divides the property of Mr. Alfred C. de Rothschild. The nearest railway station is Wendover. Motorists going from town are warned of police traps from Hendon to Stanmore, and from Berkhamsted to Tring. A long distance trap is in existence at the latter spot. Among the drivers of cars will be Capt. Masui, Messrs. W. Whittall (Crypto); F. Coleman (White steam car); J. E. Hutton (Berliet); W. H. M. Burgess (Pilain); A. C. Earp (Iris); J. M. Garnham (Daimler); W. Hacker Arnold (Whitlock-Aster); C. Watney (Pipe); C. Friswell (Peugeot); C. Bianchi (de Dietrich); E. M. C. Instone (Daimler); J. E. Lound (Beaufort); A. L. Guinness (Darracq); M. Brooke (Brooke); O. Cupper (Metallurgique), and other well-known cars and drivers.

### HAZLEWOOD HILL.

THE competition for the Du Pre Cup took place on Saturday last at Hazlewood Hill, near Duffield, Derbyshire. The cup is competed for annually and is open to members of the Leicester, Nottingham and Derby and District Clubs. The cup is awarded to the car which achieves the most meritorious performance, which is decided by the

Automobile Club of Great Britain and Ireland. The following is a list of the competing cars with the times:—

Name.	Car.	Min. sec. 5ths.
F. A. Bolton	25-h.p. Daimler	1 14 1
W. M. Hutchinson	30-40-h.p. Daimler	1 28 4
E. W. Wells	30-40-h.p. Daimler	1 32 1
J. A. Doran	22-h.p. Minerva	1 52 2
J. A. Doran	30-h.p. Rolls Royce	1 52 4
M. Ross Browne	25-36-h.p. Brasier	2 0 2
C. T. Leech	18-22-h.p. Daimler	2 4 0
Capt. W. Byron	20-h.p. Rolls Royce	2 11 4
R. Cripps	26-30-h.p. Argyll	2 16 1
G. A. Strutt	16-20-h.p. Humber	2 24 2
E. Arnott	22-h.p. Minerva	2 25 0
R. G. Hogarth	12-16-h.p. Clement Talbot	2 28 0
J. A. Harper	16-20-h.p. Humber	2 29 4
T. C. Pullinger	16-20-h.p. Humber	2 39 1
L. P. Moll	15-h.p. Darracq	2 40 2
A. J. Clay	20-h.p. Ryknield	2 53 3
H. J. Marsden	20-32-h.p. Darracq	3 2 2
Capt. W. Byron	16-h.p. Minerva	3 10 2
Dr. H. W. Boreham	10-h.p. Darracq	3 39 2
H. E. Barron	10-h.p. Peugeot	3 43 4
G. F. Reading	10-h.p. Wolseley	3 47 2
C. J. Allin	8-10-h.p. Humber	3 59 1
R. Sutton Clifford, junr.	12-h.p. Georges-Richard	4 10 1
C. H. Smith	8-h.p. Rover	4 41 1
J. T. Eady	8-h.p. Waite	5 28 2
H. G. W. Dawson	7-8-h.p. Swift	5 38 1
H. C. Reading	10-h.p. Wolseley	Stopped.

Messrs. Charles Perry, Nottingham, and F. K. Ward, Leicester, officiated as timekeepers. Mr. P. E. Joule, Derby, clerk of the scales; Mr. R. Sutton Clifford, junr., Mr. C. J. Allin, Mr. Alan McAlpin, and Mr. Booth Granger as clerks of the course, and Mr. R. Sutton Clifford, junr., starter and secretary of the meeting.

Where the cars were waiting their turn at the bottom of the hill the road was very narrow and had a sharp bend at the point. Mr. G. H. Wait was sitting in the Clyde car, which was waiting its turn at the rear of the row of cars. He heard a noise behind, and, turning round, saw a big Daimler come swinging round the bend only about 30 yards away. The driver saw that the road was blocked and jammed on his brakes. The wheels skidded, and the car swung round sideways and toppled over on to the back of the Clyde car. It broke the fall of the other car but bent the back axle of the Clyde and the back part of the frame. The owner of the Daimler and his daughter were thrown out, and it was fortunate that the party escaped with only a few cuts and bruises.

### NORTH EASTERN.

THE following are the official results in the hill-climbing competition at Ragbathside, held by the North Eastern Automobile Association on the 16th inst.:

- CLASS 2.—Motor-bicycles. Only one ran. V. Corbett, N.S.U.
- CLASS 5.—Capacity not exceeding 2 litres; seven ran. 1st, Co-operative Wholesale Society, 10-h.p. Alldays. 2nd, R. A. Young and Co., 10-h.p. Darracq.
- CLASS 7.—Capacity not exceeding 3 litres; two ran. Captain H. H. Paynter, 12-16-h.p. Wilson-Pilcher.
- CLASS 8.—Capacity not exceeding 4 litres; three ran. Mr. J. R. Ritson, 10-h.p. Stanley steamer.
- CLASS 9.—Capacity not exceeding 5 litres; only one ran. Mr. C. R. Engelbach, 18-24-h.p. Wilson-Pilcher.
- CLASS 11.—Capacity exceeding 6 litres; two ran. Mr. G. S. Barwick, 30-h.p. Daimler.

The fastest time on the hill was made by the 30-h.p. Daimler, which was 17 sec. faster than the 40-h.p. Fiat running in the same class. On the handicap for all cars, the Stanley steamer, in spite of being classed as equivalent to an 8-cylinder petrol engine, came out the best, the second being the 10-h.p. Alldays car, entered by the Co-operative Wholesale Society, and the third the 30-h.p. Daimler.

Arrangements are being made for re-holding this competition on the 7th prox., when a very interesting competition is expected, as there are already considerably over 50 entries.

### SOUTH HARTING.

SATURDAY'S hill climb at South Harting was a great success, calling forth a large entry of cars thoroughly representative of the present state of the automobile industry. The cars were weighed at Petersfield and were then driven to the hill about four miles away. The hill on which the contest took place is 1,833½ yards in length, the average gradient being 1 in 9, with 1 in 7 in the steepest part.

The features of such meetings are familiar and similar, and of most general interest is the results as determined by the timekeepers and duly set forth on the next page. Some incidents, however, stand out prominently in a day of considerable interest. Mr. E. M. C. Instone's driving in Class D. was conspicuous, for after colliding with a post and swerving across the roadway, he came well into the straight and safely careered up the hill. In Class C interest was whetted by the entry of Mr. Frederic Coleman's 18-h.p. White.

steam car; but ill-luck prevented his appearance in time. He was proceeding in the morning to the weighing-in when the engine began to jump, and on being dismantled it was found that the link motion had snapped. A new link was put in after two and a half hours' working, and he resumed the journey to Petersfield, where the link again snapped, the guide having been thrown out of line. Later in the day, however, Mr. Coleman was able to enjoy a racing run up the hill. Mr. H. E. Hall's Fraschini made a good appearance in Class C.

After the high-powered cars had gone up the hill, the performances in the other classes appeared somewhat tame. The results in Class B were all in favour of the Darracq—just as the Daimlers had done well in D and C. In consequence, however, of protests the prizes are being withheld until the adjudication by the committee. Mr. Ernest Arnott withdrew his entry, as he heard that other competitors had entered vehicles which were not standard cars as delivered to customers.

In Class A there was a varied entry, a Stanley steamer and the 10-h.p. Alldays, which have done so well in Midland competitions, being in the first quartette, and the new Reo, driven by Mr. F. G. Sharp, maintaining the excellent impression created by its performances in Scotland earlier in the month. The marks scored by the leading competitors in each class were as follows:—

# CLASS B.

For cars the chassis price of which is £300 and not more than £500.			
No.	Car.	Driver.	Points.
1.	20-h.p. Darracq	W. G. Wright	264
2.	20-h.p. Darracq	A. H. Walker	254.2
	20-32-h.p. Darracq	S. Girling	231
	20-32-h.p. Darracq	G. F. Heath	229.6
	20-32-h.p. Darracq	A. L. Guinness	214.4
	12-16-h.p. Talbot	Q. O. Grogan	212
	14-h.p. Germain	H. Ramoisy	200
	12-16-h.p. Clement-Talbot	T. H. Woollen	197.6

# CLASS A.

For cars the list price of which is £150 and not more than £350.			
No.	Car.	Driver.	Points.
1.	10-h.p. Stanley	A. Bruck	188.4
2.	10-12-h.p. Coventry Humber	L. Coatalen	172.4
	10-h.p. Alldays	E. J. Blakemore	171
	10-h.p. Alldays	F. W. Huband	170.4
	16-h.p. Reo	F. G. Sharp	149.4
	8-h.p. James and Browne	C. L. Cattell	107.6
	10-12-h.p. Humber	Mrs. H. Musker	91.6

The South Harting Hill Climb.—The 18-22 h.p. Whitlock Aster making the Ascent.

# CLASS D.

For cars the chassis price of which is over £850.

No.	Car.	Driver.	Points.
1.	35-h.p. Daimler	E. Manville	286.6
2.	35-h.p. Daimler	G. D. Powell	276.6
	60-h.p. Napier	C. Edge	275.6
	60-h.p. Berliet	J. E. Hutton	273.8
	60-h.p. De Dietrich	C. Bianchi	273.2
	35-h.p. Daimler	E. M. C. Instone	272.4
	35-45-h.p. Daimler	H. Musker	271.2
	35-h.p. Daimler	A. D. Grigg	264.8
	60-h.p. Napier	S. H. Pearce	262.8

# CLASS C.

For cars the chassis price of which is over £500, and not more than £850.

No.	Car.	Driver.	Points.
1.	30-h.p. Daimler	G. S. Barwick	278
2.	50-h.p. Napier	Miss D. Levitt	276.2
	40-h.p. Darracq	A. Rawlinson	273.8
	30-40-h.p. Daimler	H. Musker	267.7
	30-h.p. Daimler	J. M. Gorham	264.6
	25-35-h.p. Fraschini	H. E. Hall	251.4

The first in each class will receive a silver cup, the second a silver medal.

The event was held under the auspices of the A.C.G.B.I. and the Sussex County Automobile Club, and the leading members of both organisations assembled in considerable force. After Countess Russell had presented the prizes, the motorists partook of tea at the invitation of Earl Russell.

At the conclusion of the programme a steam car went up the hill, followed by a petrol car, officials taking times and facilitating the event, which proved of considerable interest. After his inability to get ready in time in the morning, Mr. Coleman sought to make a sporting match with some of the successful cars. Thus it came about that on his 18-h.p. White steam car he was matched up the hill against Miss Dorothy Levitt on the 50-h.p. Napier. The latter made a splendid run, getting well away at the start. Mr. Coleman went up with a rush; getting near the top he had to shut his throttle for the last bend; then he opened out and finished 1½ second ahead of the other car, also beating the fastest time of the Daimler by one-fifth of a second. Such events add a spice of interest to club events, and certainly gave a good conclusion to the South Harting climb.

# GRINDLEFORD.

The winners in the various classes of the Sheffield Club's hill-climb

Grindleford, reported in last week's issue, have been officially declared as follows:—

- CLASS 1.—(1) A. Farnell, 30-h.p. Daimler.  
(2) Ben Hind, 12-h.p. Talbot.  
CLASS 3.—(1) J. H. Hall, 20-h.p. Darracq.  
(2) T. Nash, 18-h.p. Mercedes.

### THE INTERNATIONAL TOURIST TROPHY RACE.

THIS competition will take place in the Isle of Man on Thursday, September 27th, with an allowance of one gallon of petrol for every twenty-five miles of the course. The following is a list of entrants at the ordinary fee of £20 per car up to Wednesday last. The fee for any entries that may now be made will increase £2 per week up to and including August 27th, after which date no further entries will be accepted:—

1. Mr. John S. Napier	Arrol-Johnston.
2. Mr. A. Rawlinson	Darracq.
3. Mr. A. Rawlinson	Darracq.
4. Hon. C. S. Rolls	Rolls-Royce.
5. Hon. C. S. Rolls	Rolls-Royce.
6. Mr. Warwick J. Wright	Minerva.
7. Mr. D. Citroen	Minerva.
8. Mr. T. B. Browne	James and Browne.
9. Mr. C. Harman Wigan	Vinot.
10. Mr. John S. Napier	Arrol-Johnston.
11. Mr. Alec Govan	Argyll.
12. Mr. Alec Govan	Argyll.
13. Mr. Harry Smith	Rover.
14. Mr. Albert Brown	Brown.
15. Mr. A. Mosses	Clement.
16. Mr. Claude Watney	Pipe.
17. Mr. T. C. Pullinger	Humber.
18. Mr. Edward Powell	Humber.
19. Capt. W. E. D. Owen	Aries.
20. Capt. W. E. D. Owen	Aries.
21. Mr. R. L. Jefferson	Rover.
22. Mr. F. Guy Lewin	Peugeot.
23. Mr. J. Ernest Hutton	Berliet.
24. Mr. J. D. Siddeley	Siddeley.
25. Mr. K. R. Brown	Siddeley.
26. Mr. J. Ernest Hutton	Berliet.
27. Mr. Tom Thornycroft	Thornycroft.
28. Mr. E. Lisle	Star.
29. Capt. H. H. P. Deasy	Deasy.
30. Mr. E. W. Lewis	Deasy.
31. Mr. Gordon Usmar	Vinot.
32. Mr. J. Percy Dean	Scout.
33. Mr. J. Lisle	Star.
34. Mr. C. H. Dodd	Speedwell.
35. Mr. J. Mayfield	Climax.

### THE OPENING OF THE ARGYLL WORKS.

ON Tuesday the new works of the Argyll Motors, Ltd., at Alexandria, near Glasgow, were declared open by Lord Montagu of Beaulieu, in the presence of a representative gathering of motorists from every part of the United Kingdom.

Mr. W. A. Smith, the chairman of the company, presided, and read apologies for absence from the Duke of Argyll, the Marquis of Linlithgow, Lord Balfour of Burleigh, Viscount Selby, the president of the Motor Car Commission, Lord Kelvin, the Duke of Ratibor, the Marquis de Dion, Baron de Zuylen, the Hon. Arthur Stanley, M.P., Sir J. H. A. Macdonald, Professor Herkomer, and many other well-known public men and motorists.

After the loyal toasts had been honoured, Dr. Robert Crawford proposed "Automobilism," and in the course of his response Mr. W. A. Smith gave an interesting resume of the history and progress of the concern, reciting some of the record runs held by Argyll cars and eulogising the work of Mr. A. Govan in designing and planning the works, which certainly must take a premier place among motor-car establishments.

Speeches were also made by Messrs. A. W. Steven, A. Govan, W. L. Sleight, A. Rodger, J. Newton, W. R. McTaggart and John Adam, and the company then made an inspection of the works, further reference to which will be made in an early issue.

### INTER-CLUB MEET AT BUXTON.

ON the initiative of the Manchester Automobile Club, an inter-club meet of the members of the Manchester, Midland, Yorkshire, North-East Lancashire, Halifax and Sheffield Automobile Clubs took place at the Empire Hotel, Buxton, on Saturday last. The weather was glorious and attracted a large number of members. There were over fifty cars present at one time in the spacious courtyard of the Empire Hotel, and, as each car had brought a full complement of passengers, the scene in front of the hotel was indeed lively. In the evening the motorists and their friends dined together at seven o'clock.

The weather was so favourable in the early part of the day that most of the members had made arrangements to go home on the Saturday night, and kept to this plan, though a heavy downfall when the time came for their departure made the surface of the roads very skiddy. Quite a number, however, stayed until after lunch on Sunday, employing the morning in using their cars to view the beauties of the Peak district. Amongst those present were the president of the Manchester Automobile Club and the chairman of the Yorkshire Automobile Club.

### THE IRISH AUTOMOBILE CLUB RELIABILITY TRIALS.

THE awards in the above trials were announced on Thursday last week, gold medals being won by the competitors mentioned below:—

#### AMATEUR SECTION.

CLASS A. (Cars under £200.)  
Mr. T. W. Murphy, 6-h.p. Rover car. Total marks 1,031 out of a possible 1,035.

CLASS B. (Cars under £300.)  
Mr. W. A. R. Heaven, 10-h.p. Cadillac. Total marks, 1,028; Maximum, 1,035.

CLASS C. (Cars under £400.)  
Col. R. Chaloner Knox, 12-h.p. Orleans. Total marks, 1,021.92; maximum 1,035.

CLASS D. (Cars under £550.)  
Mr. G. M. Mears, 16-20-h.p. Beeston Humber. Total marks, 1,019.14; maximum, 1,035.

CLASS E. (Cars under £700.)  
Mr. T. Henshaw, 23-h.p. Daimler. Total marks, 1,029.62; maximum, 1,035.

CLASS F. (Cars above £700.)  
Sir W. G. D. Goff, 20-h.p. Clement. Total marks, 1,003.7; maximum, 1,035.

The winners in the different classes in the Open Section were as follows:—

Class.	Entrant.	Car.	Total marks gained.	Maximum marks.
Class A	Chambers Bros.	8-h.p. Chambers	1,035	1,035.
Class B	Mr. J. E. Mills	8½-h.p. Clement Talbot	1,034	1,035.
Cars under £400.				
Class C	Argyll Ltd.	10-12-h.p. Argyll	1,017	1,035.
Cars under £550.				
Class D	Mr. T. C. Pullinger	16-20-h.p. Beeston Humber	1,005.42	1,035.
Class E.	Mr. T. Henshaw	28-h.p. Daimler	1,034.49	1,035.

The Goff Cup for the best performance in the whole of the amateur classes was won by J. B. Dunlop (10-12-h.p. Coventry Humber) who scored 1,018.76 marks.

The Dunlop Cups for 1st and 2nd best performance in the Open Class were won by S. T. Robinson (20-24-h.p. Clement-Talbot) 1,030.74 marks, and H. du Cros, Jun. (25-30-h.p. Austin) 1,025.99 marks.

### MOTOR-CYCLING CLUB.

IN the Motor Cycling Club's Private Owners' Trial on Saturday last four members completed the 100 miles without stopping; these were sent for a speed judgment test of five miles with the following result:—

		Min.	sec.
1. R. C. Davis	2½-h.p. Rover	15	6 2.5
2. G. C. Grimsdale	2½-h.p. Bat	15	12 2.5
2. L. A. Baddeley	3½-h.p. N.S.U.	15	34 3.5

### THE INSTITUTION OF AUTOMOBILE ENGINEERS.

THE eighth annual meeting of the members of this Institute was called for Thursday last week, at the Grand Hotel, Birmingham, for 7.30 prompt. At that hour, however, only three members were in attendance, and after waiting for half an hour, in accordance with the rules, no other members attended and the business was transacted by the Council. The meeting should have been held, according to the rules, within the first four months of the year, i.e., before the end of April, but the difficulty has been to raise a quorum of members. Even now a quorum was not present, and for that reason the business had to be undertaken by the Council. The only members present besides the president (Mr. A. E. Tucker) were Mr. O. P. Clements, (past president) and Mr. F. E. Baker. There were also present the secretary (Mr. C. H. McPherson), and the solicitor (Mr. Sylvester).

The chief matter for consideration was the alteration of the rules so as to comply with the new conditions which would arise on headquarters of the Institute being transferred from the Midlands to the Metropolis. On this point the Council's report contained the following:—It had been proposed to rent suitable premises, and so establish a home for the Institute, in Birmingham, but, as a consequence of their

most careful deliberation, your Council have decided to transfer the headquarters of the Institute to London. It had become increasingly apparent that London offered a much wider scope for the Institute than Birmingham, and they have met with cordial support in this connection from the many gentlemen interested in motor engineering. The use of the rooms of the Institution of Mechanical Engineers has been most generously placed at the disposal of the Association, the proposed new title of which is that of "The Institution of Automobile Engineers." The report was adopted by the Council and the balance-sheet showed that the accumulated funds of the Institute amounted to £244 1s. 2d. The formal business connected with the transference of the Institute was gone through by the Council under the guidance of the solicitor, the first requisite being to pass a resolution constituting the present meeting a legal one, seeing that it was being held two months later than the time specified in the rules.

Nominations for officers of the Institute were received and the voting resulted as follows:—

President:—Lt. Col. Crompton, R.E., C.B.

Vice-Presidents:—Messrs. Douglas Leechman, and E. H. Godbold.

Members of the Council:—Messrs. G. H. Nash, Victor Riley, Charles Sangster, Archibald Sharp, Percy Martin, and W. G. Phillips.

### A MOTOR-BUS SERVICE IN WALES.

THE Cambrian Railways having received delivery of the first two "Orion" motor-omnibuses from Messrs. Moss and Woodd, they recently subjected them to numerous severe tests over the hilly and mountainous roads around Pwllheli, under the supervision of the following gentlemen:—Mr. Herbert Jones, locomotive superintendent; Mr. Gough, traffic manager; Mr. Dunbar, works manager, and Mr. Macdonald, engineer.

The following is the summary of the week's work, which was carried through without a stop or hitch on any occasion:—Two trips were made on the 11th inst. to Edeyrn *via* Bodvean and Nevin, at each of which places are nasty hills of 1 in 6 to be negotiated, with very sharp corners. On the second journey the vehicle was loaded with twenty-two adults, thirteen children, and 9 cwt. of weights in the place of luggage, and successfully mounted the hills without a stop. On Tuesday, the 12th inst., a circular trip was taken, starting from Pwllheli Station through Llanbedrog, Aber-soch, Llanengan, Llangian, Llandeow-nang, Ddifryn, Sarn, Bryncross to Aberdaron. At all of these places the gradients are very steep, both entering and leaving the villages. Near Aberdaron the level showed the hill to be steeper than 1 in 5.

On the return journey the route was altered at Sarn to pass through the beautiful Nanhoron Valley, Llanfihangel, Bachollaeth, Rhyd-y-chafdy, Efail-Newydd to Pwllheli. The car gave entire satisfaction, having negotiated all the gradients without a stop or hitch of any kind. The rest of the week was taken up with running the cars over the ordinary route. On Saturday, the 16th inst., a select party of the directors and friends travelled to Pwllheli by special train to officially start the service. After inspecting the 'buses, which were standing in readiness by the platform, a move was made to inspect the garage that has been erected to house the vehicles. The building is well arranged to give a good draw in and plenty of clearance for cleaning purposes. Two large inspection pits have been provided, and petrol storage is arranged in a 250 gallons cistern sunk in the ground outside the garage, the spirit being drawn up by means of a pump. The party then boarded the cars, and Mrs. Bailey Hawkins, the wife of the chairman of the Cambrian Railways, under the guidance of Mr. Moss, started the first car by pulling the change-speed lever into first speed and letting in the clutch, thereby declaring the service open. A pleasant journey was then made to Nevin, a halt being called for lunch at the Nanhoron Arms Hotel, a commodious and quaintly built hostelry recently erected to accommodate the increasing influx of visitors that patronise this healthy and beautiful spot.

The return to Pwllheli was successfully accomplished by a different route. Upon arriving at the station the visitors complimented Mr. Moss upon the excellent working of the 'buses, and wished the Cambrian Railways every success in their new venture.

### ROAD REPORTS.

LANCASHIRE.—The proprietors of the United Alkali Works, Thornton-in-the-Fylde, have placed at the disposal of the Thornton Urban Council a waste liquid product from the works for the purpose of trying experiments in dust laying on the roads. The surveyor is making arrangements to treat the streets and roads with the liquid once a week.

WORCESTERSHIRE.—The County Council of Worcestershire has declared in favour of the maintenance of main roads being made a national charge.

WESTMINSTER.—The following streets in the city of Westminster will be repaved at or about the dates mentioned:—July 2nd to 23rd, Garrick Street; August 13th to end of month, St. Martin's Lane and Waterloo Place; from September 3rd to 31st, Charing Cross Road.

BURY ST. EDMUNDS.—The Town Council is about to make application to the A.C.G.B.I. for a supply of notices cautioning the drivers of motor-cars to reduce their speed when passing through the town.

CHESHIRE.—In Central Cheshire, beyond Northwich, the roads just now are simply perfection, and a credit to their surveyors. One of the best roads is that leading from Stretton (near Warrington) to Tarporley, about fourteen miles of the best possible surface and a beautiful country. Most of the roads leading to Chester are also in good surface, being fairly free from dust.

### NEW COMPANIES REGISTERED.

NORTHERN AUTOMOBILE COMPANY, LTD.—Capital, £5,000. To acquire the lease and option of purchase of premises in Oak Lane, Manningham, Bradford, lately used as tram sheds and now in part occupation of the Bradford Carriage Company. Registered office, Oak Lane Garage, Bradford.

DOOK SWAIN TYRE AND RUBBER COMPANY, LTD.—Capital, £8,000. Object: To adopt an agreement with E. A. Dook and L. H. Swain, and to carry on the business of manufacturers and vendors of and dealers in noiseless pneumatic and other tyres, motor-cars, and other vehicles, &c. Registered office, Soho Works, Pollard Street, Ancoats, Manchester.

MOTOR CARBURETTOR SYNDICATE, LTD.—Capital, £4,000. Objects: To adopt an agreement with G. L. W. Dorwald, and to carry on the business of manufacturers of carburettors, motor-car and cycle manufacturers, &c. Registered office, 20, Eastcheap, London, E.C.

A. DARRACQ AND CO.—(1905).—An interim dividend on the ordinary shares has been declared at the rate of 2s. per share, free of income tax.

A 6-h.p. Beyrol Light Car mounting Netherhall Gardens, N.W., the well-known test hill, with three passengers on board—an excellent performance for so small a vehicle.

### INLAND REVENUE.

MR. THOMAS CROOK, of Hilldrop Road, Holloway, was summoned to the North London Police Court for keeping a carriage without a licence. Mr. Hawkins, who appeared for the Board of Inland Revenue, said the carriage in question was a motor-car—LC 3576. The defendant said the car was registered, and he had a driver's licence, but he did not know he needed a licence for the car until he had it actually in use. In reply to the magistrate, Mr. Hawkins said that a carriage licence was necessary for any vehicle drawn by a horse or propelled by steam, electricity, or other motive power. Mr. d'Eyncourt said the penalty was £20; but the defendant would be fined only 20s. and 2s. costs.

### CASE AGAINST A CYCLIST SCOUT.

AT Beaconsfield Police Court a cyclist in the employ of the Automobile Association was summoned for "not giving warning by ringing his bell while passing persons in the road." The occurrence took place on the Bath road, near Taplow. The evidence showed that at the particular point the road was 21 ft. wide; on the right-hand side was a path 6 ft. wide, and on the left was a large open space of grass. It appeared the only persons in the road were two constables who had been engaged in trapping motorists. The cyclist passed these men at a distance of 6 or 7 ft., at the furious (?) speed of four miles an hour. The cyclist was defended by Mr. Walter Payne, instructed by Messrs. Amery-Parkes and Co., solicitors to the Automobile Association. As a result the magistrate dismissed the summons and awarded costs against the police.

## PUBLIC MOTOR SERVICES.

Two plain-clothes policemen tested the speed of a motor-omnibus driven by Francis Rowe, in the Broadway, Cricklewood, over a measured 220 yards, and discovered that the rate was fifteen miles an hour. The chauffeur, at Hampstead Police Court, pleaded that he was driving a very powerful car, and it was difficult to judge the pace when one changed from one car to another. He added that there was great competition in this trade, and they had to work very hard to earn a living. He was fined £2 and costs.

THE Eastbourne Corporation have withdrawn their motor-buses from the Lascelles Terrace route.

WITH reference to the London to Brighton motor service mentioned in last week's issue, the company hope to receive delivery of eight motor char-a-bancs within a few days. The service from the Hotel Metropole, London, to various south-coast resorts will then be commenced.

IT was explained at the first statutory meeting of the Manchester District Motor Omnibus Company, held at 60, Spring Gardens, Manchester, that the motor-buses of the company will soon run in the Manchester suburbs. Mr. Hardman A. Earle, the chairman, stated that a good deal of time had been spent in looking for a garage, which it had been estimated would cost to build about £5,000. They had now found a building in Trafford Park which suited their purpose admirably, and most of the vehicles were ready for delivery. They had appointed an engineer and drivers, and Mr. D. Boyle had arranged the routes. The first service would be started on the Stretford route. The report showing the receipts was submitted in accordance with legal requirements. The amount received in cash by the company was stated to be £37,497. The amount paid on account for omnibuses was £8,023.

ON Monday the New London and Suburban Omnibus Company replaced their service of horse vehicles plying between Kingston and Richmond with motor-buses.

THE Isle of Wight County Bench has accepted three sureties of £100 each for prosecuting an appeal against the conviction of one of the drivers of the Isle of Wight Motor Express Syndicate for using a car not constructed on the principle of consuming its own smoke.

THE time table of the new motor service between Westbourne Park and Southall is now included in the local time tables.

LITIGATION is proceeding at the South West (London) Police Court between the L.C.C. and the Road Car Company, who have converted their stables at Wellington Road, Battersea, into a garage without fulfilling the requirements demanded of them.

A FIRM of Hindoo merchants in Surat has started a motor-car service between Surat and Dumas, India, a distance of ten miles.

THE Folkestone Motors, Ltd., have started daily special runs to Hythe, via Newington.

THE Highways Committee of the Wandsworth Borough Council have had before them a letter from the Commissioner of Police in reply to the letter received from the council on the subject of motor-omnibus traffic in Putney. The Commissioner is satisfied that the police are alive to the necessity of strictly enforcing the law in all cases, and that whenever visible vapour is seen to be emitted by motor-omnibuses the matter is reported by the police and particulars sent to the London County Council that whatever action considered desirable may be taken. The Commissioner suggests that if the Council's measures in regard to the dripping of oil are not sufficiently effectual the Council might take action under the Highways Act. The committee state that they are consulting the solicitor in regard to the Commissioner's suggestion.

## CASES AGAINST MOTORISTS.

*[It must be understood that it would be impossible to report all the cases that are heard every week; we therefore endeavour to give only those which involve points of particular legal importance or of public interest.]*

SIX London motor-car drivers and owners have been fined nearly £30 with costs by the Mayor of Colchester, who, when the guest of the Essex Automobile Club a few days before, expressed the hope that motor-cars would often visit Colchester.

AT the Bradford Police Court, Arthur S. Drummond was summoned for using a motor-car without sufficiently illuminating the identification plate. In a letter to the Stipendiary Magistrate the defendant pleaded guilty, and said he had lent his own lamp to a friend. It was stated by Chief Inspector Jones that the defendant had been eight times previously convicted, three times for this particular offence. A fine of £2 and 7s. costs was imposed.

AT Wilmslow Police Court, John Batty, Didsbury, was charged with driving a motor-car at a greater speed than twenty miles an hour between Wilmslow and Alderley. The evidence showed that the defendant passed through Wilmslow at a rate of about twenty miles an hour, and then covered two miles at the rate of thirty miles an hour. The Bench fined the defendant 40s. and costs.

AT Alton, Kiugi Yano, a Japanese, has been summoned for riding a motor-bicycle at a speed of over twenty-five miles an hour. The defendant stated he was only trying the machine. He was fined £1, including costs.

AT Colehill Police Court, the police have had two summonses against Ashley Myott, earthenware merchant, Newcastle-under-Lyme, for driving a motor-car at a speed which was dangerous to the public, at Colehill, on May 5th, and also for refusing to stop his car when

requested by a police-constable. The Chairman said the magistrates meant to stop excessive driving through towns and villages, and they would make an example of defendant by fining him £5 and £1 11s. 6d. costs for the dangerous driving. The second case was dismissed. Leave was given to appeal against the conviction.

AT Chiswick, Arthur Thomas has been summoned for driving a motor-car at High Road, Chiswick, on March 29, at a speed exceeding twenty miles an hour. Defendant was represented by his wife, who said he had been out of employment several months, and he was now in a situation in the provinces. Defendant also sent a letter to the court, and stated that at the time he was learning to drive a motor-car. It was stated that defendant was going at over twenty-five miles an hour. The Bench imposed a fine of £3 and £2 2s. costs.

SEVEN motorists were fined at the Oxted Police Court on Monday. One, Charles O'Connor, Great Russell Street, London, W.C., admitted that he was unable to attend the last court as he had to appear at Godalming the same day, when he was fined £10 and costs. After leaving South Godstone he was stopped by the Sussex police and fined £5 and costs. Defendant also admitted that during the last nine months he had paid £37 in fines and his licence had been suspended for six months. The Bench fined him £15 and costs, and suspended his licence for twelve months.

AT Bromley (Kent), Frederick Small was summoned for driving a motor vehicle, with trailer attached, without anyone on the trailer who could apply any brake power. Arthur Cook, the owner, had also been summoned for permitting the vehicle to be so driven. The owner was fined £1, and Small 10s., with costs, 10s. in each case.

ALGERNON BUTLER, Tunbridge Wells, was summoned at Bromley (Kent) for driving a motor-car on the 3rd inst. without having a light to illuminate the identification number; with not having a light in front, and also with not producing a licence when asked to show it. Fined £1 and costs for not having a front light, 10s. and costs for not having a rear light, and 10s. and costs for not producing his licence.

FIVE cases against motorists at Horsham on Saturday resulted in an addition of £13 to the county funds.

ON his way to the Scottish Trials Mr. A. E. Crowdy, Delamere, Castle Bromwich, fell into the police-trap at Slyne, and at the Lancaster Police Court has been fined £7 and costs.

## POLICE TRAPS.

A TRAP is being worked on the road from Lewes to Brighton. It is at present located close to the County Prison, Lewes, but we hear it is to be moved about on that road.

MOTORISTS on the Hayes-Uxbridge Road should beware of police devices on that road during the week end.

WE hear that police activity is likely to be directed towards motorists in Henley week, and drivers through Maidenhead and Twyford should beware of traps.

SEVERAL traps are being set in the suburbs of Essex, notably in the Woodford and Wanstead districts.

THERE is a two-mile trap between Wilmslow and Alderley, and one of 220 yards in the centre of the village of Alderley Edge.

MOTORISTS in the south should look out for a police-trap at any point between the top of Egham Hill and the turn below the Wheatsheaf Hotel to Ascot.

## MOTOR-CAR ACCIDENTS.

A STARTLING accident to a motor-car occurred near Buxton on Saturday. The car, which contained five passengers, had reached a dangerous bend in the road just below the Cat and Fiddle, and being unable to round the curve shot across the eight feet of roadside grass, dashed through a limestone wall, and rolled over and over down the slope for eighty yards, being finally wrecked against another wall. The experience of the passengers was terrible. They were thrown in all directions, but fortunately did not go down the declivity. Another car came up containing two medical men, who rendered every aid.

AFTER inquiring into the cause of death of an actress's maid, who was knocked down by an electric brumham, the jury returned a verdict of "Accidental death," but expressed the opinion that proper precautions had not been taken by the chauffeur to give the alarm in the congested traffic.

AN inquiry was held before the deputy-coroner for Birmingham, on the 13th inst., into the circumstances of the death of Harold Price Baker, of Selly Oak, who was killed in a motor accident at Olton on the previous Saturday night. Herbert Collins, chauffeur of the motor-car, which belonged to Messrs. Wills and Sons, of London, railway contractors, attended in custody of the police. Evidence showed that the prisoner was on the wrong side of the road, and a police-sergeant declared that he was under the influence of drink. The jury found that death was caused by the prisoner's negligence, and he was formally committed for trial on a charge of manslaughter.

## MOTOR-BUS ACCIDENT.

ON Monday a motor-bus mishap occurred on the London-Brighton road, the driving rod of a vehicle breaking between Cuckfield and Burgess Hill and causing the vehicle to swerve across the road. Fortunately no one was injured.

# THE Motor-Car Journal.

[No. 383.

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

## COMMENTS.

IT is evidently a wise thing not to offend the magistrate, as a Kensington motorist has just done, by non-attendance at successive adjournments of his case. Ultimately, when he did appear on Tuesday at the Greenwich Police Court, he was fined £10 and 6s. costs, and the magistrate said his motor-car would be detained until the money was forthcoming. Should many such cases occur the provision of garages at police stations may become a necessity, and then the magistrates may be tempted to increase the fines to cover the cost. That, at least, would be the way of the "great unpaid." There is no doubt, apart from the justice or merits of the case, that motorists will find it an economy to be punctual and civil in any dealings they may have with the magistrates.

### Social Events.

DURING the present month and August some particularly interesting gatherings of motorists are to be held, and some of the clubs contemplate spending week-ends in most delightful surroundings. Mr. C. D. Rose, M.P., will meet the Berkshire Club at Pangbourne, and Mr. C. Hardy will entertain the Nottinghamshire Club at Bulwell Hall. The former organisation has also accepted an invitation from Earl Roberts, K.G., to meet at Englemere on the 18th inst. Among inter-club meets there is that of the Essex Motor Club and the Motor Cycling Club at Burnham-on-Crouch, likely to attract a goodly number of motorists of both the land and the water variety. Dr. and Mrs. Firth are having an "at home" to-day (Saturday) to meet the members of the Kent and the Blackheath Clubs, and next week motor-carists will have a hill-climb at Fernhurst under official auspices, while motor-cyclists will see some record-breaking efforts at Canning Town. In the north speed trials on the sands between Redcar and Saltburn will claim the attention of Yorkshire motorists.

### The Trend of the Trade.

FINE weather has doubtless had its effect on the demand for cars, and done something to deplete the showrooms of their stocks. The effect of the Grand Prix race has already been seen in the premiums charged for the early delivery of the cars of certain successful types—a policy which is apparently necessary to restrain the demand to a point of possible supply, but which will have the effect of sending some prospective motorists to a comparison of such prices with those of competing firms, and thus customers may be lost—irretrievably. One of the most distressing aspects of the motor-car business to the successful agent is the return of deposits when he realises that he cannot augment his supply of vehicles of the type in good demand. At the same time there are plenty of cars available for sale, and a conspicuous feature of the small

advertisements in the *M.C.J.* last week was the number of large cars on offer by motorists who publicly declared their intention of purchasing vehicles of less power. It would be interesting to know the reason of this, and whether the attitude of the police in certain ill-favoured districts is responsible for the feeling of uncertainty which has come over some motorists whose enthusiasm was once a matter of daily demonstration, but who now seem disinclined to take the risk of police persecution.

### A Motor-'bus Guard.

EXPERT evidence with regard to motor-'buses was given to the Select Committee on London Traffic, on Tuesday, by Mr. W. Worby Beaumont, who said that the present practice of inspection was to look at the visible parts and take the maker's guarantee for the invisible parts. He thought that for the present at any rate there should be a certain clearance beneath a motor-omnibus. At places where people crossed the street most frequently 'buses generally moved slowly, and if a person fell clear of the wheels the 'bus might pass over him without doing him injury. If a certain clearance were made a condition for a year or two it would be seen if it were really of importance. He thought a guard, or cowcatcher, might be fitted to motor-omnibuses, and, as a matter of fact, had seen one in course of construction in the works of the Road Car Co. The guard was a flat board nearly of the width of the wheels, slightly tilted downwards, and made to run within about three inches of the ground. Such a contrivance might carry a person forward or push him aside, and, in Mr. Beaumont's view, it is a thing which ought to be tried.

### Still Growing.

THE Automobile Association Press run will take place on Sunday, the 8th, starting from Colonel Bosworth's house, Cedar Court, Roehampton, at 10.30 a.m. The cars will proceed by way of Sutton, Reigate, and Crawley to Brighton, where luncheon will be taken at the Hotel Metropole. Any member caring to join the party either at Roehampton or Brighton will be cordially invited. The strength of the Association is increasing daily, and its usefulness extending far beyond the anticipation of the founders. Those not already in membership should apply for particulars to the secretary, at 18, Fleet Street, E.C.

### The G.E.R. and Motor-'Buses.

AMONG railway directors the late Sir Wilfrid Lawson was the first to realise how important the motor-car might become as a feeder to the companies if properly and promptly adopted. His view is now the accepted one among railway experts, and all the great lines are favouring the motor-'bus to deal with the traffic obtainable from isolated districts, and from those places inaccessible by the ordinary route. The Great Western Railway in Cornwall, and the North Eastern Railway in some parts of Yorkshire, have been able to successfully combine the motor-'bus service with their ordinary railway facilities, to the advantage of passengers and shareholders alike. In East Anglia the Great Eastern Railway Company has been quite as enterprising as these other lines, and their motor-'bus services are appreciated

features of the traffic at Colchester, Chelmsford, and other centres of population. Several vehicles have been made at the works at Stratford, but the management is not necessarily committed to one style of vehicle, and the first of three motor-buses which the Thornycroft Company has in hand for the company has just been delivered at Stratford, and several trials have been made during the last few days preparatory to its being put on the road for public service. The Maudslay Company is also building three motor-buses for the Great Eastern Railway Company, which is evidently determined to meet the heavy demand for passenger accommodation in East Anglia.

#### Horse Driver v. Motorist.

SUMMONS and cross-summons lately attracted a good audience in the court-house at Macclesfield. Both parties were prominent in their respective spheres, Mr. Gerald Higginbotham as a motorist, and Mr. C. E. Thornycroft as the Chairman of the County Council Education Committee, and not yet a motorist. The first gentleman summoned the second for driving a dog-cart on the wrong side of the road, and the second took similar legal process against the first for driving a motor-car in, as he alleged, a dangerous manner. Mr. Higginbotham was driving into Macclesfield one morning last month when a serious accident, owing to the dog-cart being on the wrong side of the road, was narrowly averted. When the motor-car was safely

Mr. S. H. Justin, of Bristol, and a member of the Motor Volunteer Corps, at the wheel of his 12-h.p. Mobile Car.

past the horse-drawn vehicle Mr. Thornycroft pulled up and addressed a series of interrogations to the motorist, using words, according to the latter's witnesses, not altogether becoming in the chairman of an education committee. The whole incident has been recited in the local police court, and, although both cases were dismissed, the impression seems to prevail locally that a useful lesson has been administered to drivers of horse-drawn vehicles who do not always disguise their hostility to motor-cars.

#### Giving Pleasure to Others.

MOTORISTS who own cars have ample opportunities for giving pleasure to others, and probably the most really satisfactory club meets of the year are those organised for the purpose of taking crippled children for a day's outing. The delight of the youngsters is unfeigned; questions of social distinction never enter into their calculations, and the motorists who thus place their cars at the service of others are able to share the joy of their little guests without any limitations. At Manchester and Sheffield these children's days are recognised engagements of the local clubs, and some other associations will shortly be added to the list of those who thus care for less

favoured mortals. The Leicestershire Automobile Club is now developing the idea so that its guests will have the maximum of pleasure. Mr. and Mrs. Ralph Walker have offered to entertain at Ratcliffe Hall as many of the members of the Leicester Cripples Guild as can be conveyed thither on motor-cars belonging to members of the county automobile club, and the latter are each subscribing half-a-crown so that each child shall have a present in remembrance of the occasion. Charity, like mercy, "blesses him that gives and him that takes," and only the sunny approval of the clerk of the weather is now wanted to make complete the happiness of the Leicestershire Automobile Club on the 14th inst.

#### Hill Climbs and Gymkhanas.

OUR columns have lately testified to a state of enthusiasm with regard to hill climbs that has something of the character of an epidemic. The days of the long procession of motor-cars following each other in dusty array are over; but the hill climb, with its opportunities for picnic and chat, is now in the zenith of its popularity. A club is scarcely recognised as a club unless it holds a hill climb or taxes the ingenuity of its officials in devising some new form of competition at a gymkhana. In view of the badly-constructed roads in many parts of the provinces, this is a wise trend of the times; but to our comment of last week with regard to accuracy of entry—a warning emphasised in the proceedings at Aston Hill—we would add a suggestion that the contests at gymkhanas have probably reached the greatest desirable point of levity in the contest in which gentlemen have to go down on their knees and immerse their noses in a pail of water while their lips range around in search of an apple. With such an item on the programme serious business can be indulged in during the rest of the afternoon.

#### Personal Attendance Wanted.

On Tuesday warrants were issued against a couple of well-known London motorists because they had not personally responded to the invitation of the police to present themselves before the Steyning Bench. Last Saturday the Guildford magistrates wished a summoned motorist to stand within the shadow of the dock, and other indignities have been reported elsewhere in the south. Unfortunately there is little escape from the vagaries of magistrates, and to the heavy fines inflicted in some courts the insistence on the personal attendance of the victims may be regarded as really an addition to the costs. Having regard to the fact that such place of alleged offence may be hundreds of miles from the residence of the motorist, this aggravation of the expense is a matter of grave injustice, to which the attention of the President of the Local Government Board should be drawn ere the report of the Royal Commission—a body of estimable gentlemen who have long lost their reputation for celerity—is presented to Parliament.

#### Children and Cars.

At the Birmingham meeting of the Motor Union reference was made to the danger of stone-throwing at motorists by school children in several districts, and it was decided to send a circular letter to the education authorities, with a warning. Since then several similar complaints have reached us, and we are pleased to hear that the police superintendent in Harrogate and Knaresborough has written to the schoolmasters in the elementary schools in his district, asking them to use their influence with the school children for the prevention of stone-throwing. Some time ago one of the Yorkshire automobile organisations wrote to the teachers in the elementary schools with good effect, and it is to be hoped that equally satisfactory results will follow the present police warning. We would also suggest that the automobile clubs throughout the country should do all they can to induce a proper spirit among school children, thus seconding the efforts of the Motor Union to abate a practice which is a danger as well as an annoyance.

### Cars—New or Old.

A CASE which is shortly coming before the courts is concerned with the problem, "When is a new car not a new car but an old one?" The question hinges on the point as to whether a car on exhibition and used for trial runs therefrom can be regarded as a new vehicle, or whether the occasional use in such a connection transforms it into an old one. It is a point of interest to the trade and public alike, and we understand that barristers with "watching briefs" will be a feature of the barristers' desks when the trial of the action takes place.

### Motorists to be Shot.

THE case of the motorist is, according to Councillor Thomson, of the Salford Town Council, analogous to that of the dog. Certainly the worthy councillor seems to be suffering from motorphobia, for he has declared, at a meeting of the Council, that he treats "the motorist as a dog. I think sometimes he goes mad, and we ought to serve him as we serve the dog. We ought to shoot him." Fortunately there are some medical men as colleagues of Mr. Thomson on the Council, and one of them, Dr. Pinder, was able to administer an antidote of common sense and reason, pointing out that diatribes against motorists were useless, and that he was opposed to anything likely to thwart their progress, which he welcomed from the

### Motor Spirit.

"THE spirit of the time shall teach me speed" is a Shakespearean quotation put to commercial uses by Messrs. Carless, Capel and Leonard, whose new list of agents for their petrol and Movril—this being a new quality of motor spirit—shows how completely the automobile industry has taken hold of the country. There is scarcely a hamlet of any size where motor spirit is not obtainable, and to the enterprise of the firms supplying petrol, in covering the country with a network of agencies, much of the development is due.

### Racing on the Sands.

THE Yorkshire Automobile Club deserves credit for having taken the initiative in holding motor-car races on the sands in this country, and although its experiment at Filey last year was partially spoiled by inexperience, a success is anticipated for the races to be held under its auspices this year between Saltburn and Marske. Now there is an active Cleveland branch of the county organisation to help, and Major Bowers, the Chief Constable of the North Riding, will see that the course, about a kilometre in length, is amply protected, to avoid a repetition of last year's *contretemps*. Lord Zetland and the local councils of Saltburn and Redcar have also shown considerable interest in the event, for which

The Ladies' Automobile Club Gymkhana.—The Start of the Final in the Police Trap Race. (See page 417.)

professional as well as the commercial standpoint. Not only was the development of the industry calculated to be of service to the country, but the car was becoming more and more used by men of his own profession, and by others who recognised its value as a means of economy and efficiency.

### Arches Across the Road.

UNTIL they actually get into operation the promoters of public motor services scarcely realise the many small points of detail which they must settle to the satisfaction of the public as well as their own. The difficulties are not confined to London; they are to be found in the rural districts as well. The passengers in a motor-omnibus which was approaching Kingsferry Bridge railway arch for the first time on Sunday afternoon, bound for Sheerness, Isle of Sheppey, had a narrow escape. Mr. W. Coomber, of Milton, near Sittingbourne, Kent, thinking that the arch was not high enough, rushed forward, holding up his hands, to warn the driver of the omnibus, which was travelling at a high speed. The car was stopped just in time, for it was discovered that there was only an inch and a half to spare. The outside passengers were obliged to lie down in order that the omnibus might pass under the arch. What with railway crossings and railway arches the motor engineer has many worries incidental to the practice of his profession.

Mr. E. H. Hepper will act as chief marshal, and Mr. C. P. Wilson, of Leeds, as secretary.

### The Tourist Trophy Race.

LAST week we gave a list of the entries which had then been received for the International Tourist Trophy Race to be held by the A.C.G.B.I. in the Isle of Man at the end of September next. To the thirty-five cars then notified must now be added the following:—36, Mr. Robert Burns (Swift); 37, Mr. W. L. Hardman (Hardman); 38, Mr. Hugh P. MacConnell (Bianchi); 39, Mr. Arthur McCormack (Gladiator); 40, Mr. Sydney Straker (Straker-Squire); 41, Mr. L. R. L. Squire (Straker-Squire); 42, Mr. Christopher Hill (Climax); 43, Mr. Harold Bruce (Metallurgique). Several other entries are pending, and "it is confidently expected that the perfect car for everyday use will eventually be obtained" by this competition.

MORE than a hundred firms have already booked space for Cordingley's Motor Car Exhibition at the Agricultural Hall, London, next year.

ON Tuesday the appeal of the driver of a motor-bus at Ryde, Isle of Wight, against a conviction for driving a vehicle which did not consume its own smoke was heard. The appeal, which was supported by the Motor Union, was allowed.

## The Grand Prix Race.

**A**S we were able to record in our last issue, Szisz—this it transpires is the correct spelling of the speedy motorist's name—proved the winner of the Grand Prix, he covering the total distance of 774 miles in 12 hrs. 14 min. 7 sec., equal to an average speed of just over 63 miles per hour.

11 min. 40 sec.; Heath, 12 min. 20 sec.; Barillier, 14 min. 2 sec.; and Lancia, 16 min. 40 sec.

At the end of the seventh round the order of the first five was Szisz, Clement, Nazzaro, Barillier and Heath. The only one who failed to finish this lap was Teste, who met with a bad

How the Cars were brought to the Starting Point on the Second Day.

The following were the competitors who set out on the second day's race, Mr. Alexander Burton taking Jenatzy's place at the wheel of the Mercedes A 6, in accordance with the rule permitting a change of drivers for the second half of the contest:—

Driver.	Machine.	Driver.	Machine.
Szisz ...	Renault.	Jenatzy }	Mercedes.
Clement ...	Clement-Bayard.	Burton }	
Nazzaro ...	Fiat.	Rougier ...	De Dietrich.
Shephard ...	Hotchkiss.	Lancia ...	Fiat.
Barillier ...	Brasier.	Hemery ...	Darracq.
Richez... ..	Renault.	Rigolly ...	Gobron.
Heath ...	Panhard.	Mariaux ...	Mercedes.
Teste ...	Panhard.	Baras ...	Brasier.
Pierry ...	Brasier.	Duray... ..	De Dietrich.

The start took place just before 6 a.m., the drivers being sent off at the same intervals of time as separated them on the first day. All repairs and replenishments having to be effected in running time, the cars were brought to the starting point by means of horses, as is depicted in the above illustration, and at the proper moment were given the signal to go. This done, the competitors made for their "ravitaillement" stations, where the necessary supplies of fuel and water were taken in, tyres changed, &c. Each competing firm had been allowed one of these stations, and the installations for the quick transfer of petrol and water to the tanks of the cars, and also for the rapid inflation of the tyres, were on quite an elaborate scale. Nazzaro and Mariaux were away with but a few seconds delay; Clement took 4 min. 37 sec. in getting off; Szisz, 11 min. 26 sec.; Teste,

accident at Champagne, resulting in injuries to his leg. Szisz finished the eighth circuit at 7 h. 50 min. 26 sec., Clement still being second, and Nazzaro third. Hemery (Darracq) retired in this round owing to valve troubles, as also did Rigolly with radiator troubles, and Shephard as the result of a broken wheel. Szisz increased his lead in the ninth lap to 42 min.; Clement was still in second place, with Nazzaro only 3 min. behind, and running strongly, a keen struggle taking place between the two. The number of surviving competitors was reduced to twelve by the retirement of Richez (Renault) owing to one of his road wheels collapsing. The completion of the tenth round saw Szisz still well to the front, and with him looked upon as a certain winner, interest centred on the battle of speed raging between Nazzaro and Clement, the latter having been overhauled by just over a minute. In the eleventh round Szisz further increased his lead to 46 min. Clement made a great effort to re-win the second place, but was unsuccessful, although he managed to reduce the margin between him and Nazzaro to 32 sec. Rougier fell out, being utterly exhausted with tyre troubles. He is stated to have changed no less than fourteen tyres in one day. Szisz entered on the last lap shortly after eleven, and as mid-day arrived the excitement grew intense. Curiously enough the final circuit was his slowest, and it was not till about 12.15 that he put in an appearance. Needless to say he met with a rousing reception. Thirty minutes elapsed ere Nazzaro finished. He had made the concluding round at the fastest pace and had

slightly increased his lead over Clement, who came in 3 min. behind. A long wait ensued, Barillier not arriving until over an hour had elapsed, while no less than 4 hr. 24 min. separated the last man from the winner.

The appended table shows the times of those who successfully completed the two-days' race of 774 miles. Taking the performances of the survivors on the second day alone it will be seen that the best time was made by Nazzaro, 6 hr. 20 min. 33 sec., Szisz being second with 6 hr. 28 min. 37 sec., and Clement third, 6 hr. 38 min. 6 sec.

Order.	Driver.	Car.	Time on first day.			Time on second day.			Time for two days.	Approx. aver. speed. m.p.h.
			H. M. S.	H. M. S.	H. M. S.	H. M. S.	H. M. S.	H. M. S.		
1	Sisz	Renault	5 45 30	6 28 37	12 14 7	63				
2	Nazzaro	Fiat	6 26 53	6 20 33	12 46 26	60½				
3	Clement	Clement-B.	6 11 40	6 38 6	12 49 46	60½				
4	Barillier	Brasier	6 31 48	7 21 12	13 53 0	58½				
5	Lancia	Fiat	7 12 9	7 10 2	14 22 11	53½				
6	Heath	Panhard	6 48 12	7 59 33	14 47 45	52½				
7	Baras	Brasier	7 41 43	7 34 7	15 15 50	50½				
8	Duray	De Dietrich	7 58 46	7 27 15	15 26 1	50				
9	Pierry	Brasier	7 59 5	8 16 2	16 15 7	47½				
10	Jenatzy	Mercedes	8 7 20	8 11 22	16 18 42	47½				
	Burton									
11	Mariaux	Mercedes	7 39 31	8 59 27	16 38 58	46½				

Szisz, who is now the hero of the hour, is a foreman in the testing department at Messrs. Renault's works at Billancourt. His average speed of 63 miles per hour compares with Thery's 49 miles in the Auvergne last year, and 60 miles in the Gordon Bennett race in 1904. A feature of the winning car is that no differential gear is provided. The engine comprises four cylinders, 165 mm. bore by 150 mm. stroke, and is rated at 105 h.p. Szisz is said to have only had to stop once on account of motor troubles, this being due to a broken plug.

As will be seen from the appended table, the fastest lap of the whole contest was made by Baras on a Brasier in 52 min. 19 sec., equal to a speed of 74 miles per hour:—

FASTEST TIMES IN EACH LAP OF 64½ MILES.

Lap.	Driver.	Car.	Time.	
			H. M. S.	
1	Baras	Brasier	0 52	19
2	Pierry	Brasier	0 52	31
3	Barillier	Brasier	0 55	23
4	Tart	Panhard	0 55	28

Le Blon on his Hotchkiss Racer.

5	Duray	Dietrich	0 52	41
6	Riches	Renault	0 57	51
7	Mariaux	Mercedes	0 58	39
8	Clement	Clement-B.	0 57	17
9	Rougier	De Dietrich	0 53	17
10	Lancia	Fiat	1 4	1
11	Duray	Dietrich	1 0	4
12	Nazzaro	Fiat	0 57	51

Although Renault has replaced Brasier as the winner of the race, the victors in the 1904 and 1905 Gordon Bennett races enjoy the honour of being the only firm whose team of three

cars successfully went through the race. Below we give a comparison of the cars entered with those that finished, and their position in the classification:—

THE RESULT OF THE RACE.

	Cars Entered.	Cars Finished.	Position in Classification.
Brasier	3	3	4, 7, 9
Fiat	3	2	2, 5
Mercedes	3	2	10, 11
Renault	3	1	1

Salleron leaving the Paddock for the Starting Point.

Clement-B.	3	1	3
Panhard	3	1	6
De Dietrich	3	1	8
Darracq	3	—	—
Hotchkiss	3	—	—
Itala	3	—	—
Gobron	1	—	—
Gregoire	1	—	—

From the foregoing it will be seen that out of the thirty-two competing cars no less than twenty-one fell out of the running, the causes which led thereto being summarised below:—

Driver.	Car.	Retired in Lap	Cause.
Fabry	Itala	1	Overturned.
De Bosch	Gregoire	1	Broken radiator.
Hanriot	Darracq	1	Broken valves.
Gabriel	De Dietrich	1	Broken radius rod.
De Caters	Itala	2	Flattened rim flanges.
Cagno	Itala	3	Engine over-heated.
Wagner	Darracq	3	Broken oil-pipe.
Salleron	Hotchkiss	3	Wheel collapse.
Touloubre	Clement-B.	3	Gear-box came loose.
Villemain	Clement-B.	4	Flattened rim flanges.
Le Blon	Hotchkiss	5	Wheel collapse.
Tart	Panhard	5	Broken dumb iron.
Edmond	Renault	6	Eye troubles.
Weilschott	Fiat	6	Ran off road.
Florio	Mercedes	6	Flattened rim flanges.
Teste	Panhard	7	Accident at Champagne due to swerving.
Hemery	Darracq	8	Valve troubles.
Rigolly	Gobron	8	Broken radiator.
Shephard	Hotchkiss	8	Wheel collapse.
Riches	Renault	9	Wheel collapse.
Rougier	De Dietrich	11	Exhausted by tyre trouble.

The organisation of the race was well carried through, the arrangements, with the exception of those for the Press, having been carefully planned. Special reference may be made to the ambulance service, which, under the guidance of Baron Henri de Rothschild, performed excellent work. All the competitors

suffered with eye troubles, due, it is considered, to the tar with which the course had been sprinkled. Edmond suffered so much that he had eventually to retire, while Jenatzy, as already mentioned, was unable to start on the second day, owing to the same cause. —

employing a *jante amovible*—as it is known—were able to get away under 4 min., one driver even succeeding in changing a tyre and rim in 1 min. 45 sec. The idea of detachable rims is not a new one, but, now that it has received the necessary fillip in the Grand Prix, they will no doubt not only be fitted to all

Szisz, the winner, leaving the Renault Station. Tart's Panhard is seen at the side of the road.

One point that has been brought out by the race is the advantage to be gained in the way of getting on the road rapidly when punctures are sustained, by employing road wheels with detachable rims, carrying as spares complete rims and tyres, the latter being already inflated. Several of the competitors em-

cars in future contests, but also to large touring vehicles.

Since the race a report has gained currency that the Automobile Club de France has decided that for next year's Grand Prize race the weight limit will be abolished, that makers will be required to build their engines with no greater cylinder

Lancia and his mechanic busily engaged in changing tyres near the Grand Stand. As will be seen, the wheels are fitted with detachable rims.

ployed wheels of this kind, including Szisz and Nazzaro, and there is no doubt that the rapidity with which they were able to replace tyres played a large part in their success. While the competitors whose wheels were fitted with tyres in the ordinary way occupied from 18 min. upwards to effect a change, those

capacity than that represented by a bore of 150 mm., or 6 in., for a four-cylinder motor. M. Rene de Knyff has, however, stated that the matter has not been considered by the Sporting Commission of the A.C.F. No doubt, however, the subject will be brought forward at an early date.

## CONTINENTAL NOTES.

### Le Criterium.

Still another touring car competition which is to be held during the present season is that known as Le Criterium, which is being organised by the Automobile clubs of Belgium, Namur and Luxembourg, and Spa. The event is to commence on the 21st inst., and continue until the 27th inst. The competitors will be divided into three classes, the first of which will be subdivided into six categories as follows:—

Class I. Category	Max. total Piston Area.	Equivalent Bore.		Mean Speed to be attained.
	cm <sup>2</sup> .	cyls.	Max. Bore mm.	kil. per hour.
1	113,097	1	120	20
2	226,194	2	120	25
3	283,530	4	95	30
4	346,360	4	105	30
5	490,876	4	125	30
6	615,753	4	140	30

The competitors in Categories 3 to 6, in addition to the five days' tour outlined below, will be required to take

### A Touring Competition in the South of France.

The Automobile Club du Rhone is organising a touring competition for the 12th, 13th and 14th inst. The competitors will be divided into five categories, according to cylinder capacity. On the first day the run will be from Lyons to Vals-Bains, *via* St. Galmier and Le Puy; on the second from Vals to Lambert and back; on the third day there will be a hill-climbing competition from Vaisseaux up the Col de l'Escrinet.

### Public Services in Germany.

Arrangements are in hand for the establishment of a motor-bus service between Bochum, Harpen, and Gerthe. A company is being formed to run public motor vehicles between Butzow, Kroplin, and Arendsee (Mecklenburg). Negotiations are also in hand with reference to the establishment of a service between Markkirch and Ekirch.

### Industrial Motor-Vehicles in France.

M. Martin, of Grenoble, who owns certain mining concessions at Saint Martin-de-Belleville, near Moutiers, is making experiments with a 20-h.p. lorry for the transport of coal between the mines and the railway station. It is also proposed to establish a motor service for the transport of goods between

Szisz, the Winner of the Grand Prix, at the wheel of his Renault Racer.

part in a 500 kilometre race on the Circuit de la Meuse, while for those in Categories 1 and 2 there will be a hill climb at Spa on the 27th inst. Class II. is for cars entering for the five days' tour and the hill climb but not the race, while Class III. is for competitors willing to enter the five days' tour, but covering the same at any speed they choose, the only obligation being that they submit to official control when starting and on arrival at their destination. On the first day the cars will make a run of about 186 kilometres, from Spa to Nimegen, and will proceed to Cologne, 166 kilometres, on the second day. Luxembourg, 226 kilometres, is the destination on the third day. Rheims, 256 kilometres, will be reached on the fourth day, while the cars will go to Dinant, 150 kilometres, on the fifth day. On the 26th inst. the competing cars will take part in a speed race, five times round the Circuit de la Meuse (about 500 kilometres). Various fetes, banquets and receptions will be organised in honour of the participants by the automobile clubs of the districts visited. Entries will be received up to the 15th inst. at the Belgian Automobile Club, 5, Place Royale, Brussels, whence information as to the various classes and regulations of the competition can be obtained.

Bourg-Saint-Maurice and the Hospice du Petit-Saint Bernard, a distance of twenty miles.

### Miscellaneous Items.

The Magyar Automobile Club of Budapest has just issued a very complete handbook.—A public service of motor-cars is being started between Avignon, Chateaufort, and Saint-Remy, France.—The annual hill-climbing competition from Schottwein up the Semmering, organised by the Austrian Automobile Club, is to be held on the 23rd September next.—A trial trip round France, extending over fifteen days, during which time about 2,500 miles were covered, has just been completed by one of the new Darracq-Serpollet steam buses.—The Buchet Company has just brought out an 8-h.p. engine, comprising four cylinders cast in one piece. The bore is 70 mm., the stroke 76 mm., and the normal speed 1,400 revolutions per minute.—The Post Office authorities in Berlin are experimentally using a motor-tricycle in the parcel post service.—A petrol motor street sweeping and watering cart has been put in service in Paris.—The race for the International Motor-cycle Cup will take place in Bohemia, on Sunday next, the 8th inst.

## SOME CURRENT TOPICS.

### Inspection Pit Dangers.

Elsewhere in the present issue a correspondent draws attention to what might have proved a fatal accident due to the presence of petrol vapour in an inspection pit. News has also reached us from Lyons that an explosion lately took place at the works of Messrs. Rochet-Schneider in that town. It appears that two men were at work in an inspection pit cleaning up a chassis, when suddenly an explosion took place. It is thought that a lighted match must have been dropped into the pit, the bottom of which was impregnated with petrol and lubricating oil. The men were quickly got out from their dangerous position, but not before they were badly burned. We have frequently urged that too much care cannot be taken wherever petrol, either in liquid or vapour form, is or may be present,

tage has also been taken in the circular by the Union to draw attention to the objections to exhaust pipes which are pointed downwards, and to suggest that the influence of manufacturers and clubs should be used to discourage the downward exhaust, in the manner suggested for the exhaust cut-out, as there is no doubt that when the discharge is carried downwards it tends to intensify the dust nuisance.

### Testing a Magneto.

A query of general interest is raised in our Correspondence columns this week with regard to the testing of magnetos. The current from a magneto machine is an alternating one, and as the magnets lose their strength the current through a fixed resistance will become reduced, owing to the fact that the magnetic field is weakened, which reduces the voltage at a given speed, and therefore reduces the current. The best method of measuring this would be to use an alternating current ampere-meter such as Siemen's dynamometer. The method is more suitable for a testing shop or laboratory, and is as follows:—When the magneto is new, run it at a fixed speed through a fixed resistance according to the relative voltage of the magneto.

The Inauguration of the Argyll Company's New Works at Alexandria, N.E.

and the two cases above alluded to may serve as a further warning.

### Exhaust Cut-outs.

We are glad to learn that, largely as a result of the discussion which originated in the columns of the *M.C.J.*, the Motor Union has taken up a subject that has often been a source of offence to the public on the roads, namely, the annoyance caused by the use of exhaust cut-outs on motor-cars. The Union is appealing to manufacturers of cars and secretaries of clubs all over the country, pointing out that this is an undesirable contrivance, and one that is of no practical value on a touring car, and, considering it is often the cause of considerable annoyance not only to other motorists but to the general public, asking the co-operation of the firms and clubs referred to in discouraging its use. The Union suggest that manufacturers should take every opportunity of preventing the adoption of this unnecessary adjunct, when advising their clients, and that committees of clubs should advise their members to refuse to take delivery of cars which are fitted with exhaust cut-outs. Advan-

The machine will then register a definite current on the dynamometer, and as it loses strength in the course of time this amount of current will gradually grow less in proportion. A rough method of judging the strength of the magnets is by noting the amount of attraction they exert upon a steel key or other similar article, but this is of course a very crude method. It should be remembered that permanent magnets do not create any force or power, they only gradually give up the magnetism which is in them, which they impart to a surrounding body such as the armature coils, and as this gradually occurs, the field magnets will undoubtedly grow weaker in a similar manner to a discharging accumulator.

MESSRS. DES CLEE AND Co., of 220, Shaftesbury Avenue, W.C., whose non-skidding tyre protectors are familiar to motorists, are also agents for Messrs. Howes and Burley, Ltd., the well-known lamp makers, of Birmingham. The latter have just issued a most effective showcard drawing attention to their specialities in headlights, sidelights, &c.

## THE DUCELLIER SWIVELLING LAMP BRACKET.

WE illustrate herewith the new swivelling and extensible lamp bracket which has lately been brought out by Messrs. Ducellier, and which has been put on the English market by Mr. André A. Godin. The brackets are arranged to be fitted in pairs and connected to the steering rod by means of flexible cable, so that when steering the car the head lamps fitted on the swivelling brackets automatically move together with the

Fig. 1.

front wheels and at the same angle, thus allowing the light to be projected in the right direction when rounding a corner. Each bracket (Fig. 1) consists of a fixed and movable part, and has attached to it a Bowden wire, the latter being connected at its opposite end to the steering bar. A third wire connects the two brackets in such a way that both turn in unison, as shown in Fig. 1. The arrangement can be fitted to all cars, whether the steering bar be in front of or behind the axle. The brackets can also be

Fig. 2.

extended to suit any size of acetylene head lights, the vertical arms supporting the lamps being arranged to slide laterally on the horizontal support and be bolted in the desired position.

FROM M. René Legros, of Fecamp (Seine Inferieure), we have received a copy of the catalogue of the René Legros motor-cars. The work contains a very complete description, with illustrations, of the action of the special form of two-cylinder engine fitted to these vehicles.

## HERE AND THERE.

A MOTOR mail van is now running between London and Hastings and *vice versa*.

THIS week 450 horses belonging to the London Omnibus and Carriage Company, Ltd., have been sold by auction.

A BATH tub forms part of the luggage of a party of New York motorists at present touring on the Continent in two large cars.

MR. H. E. HUGHES, of Brinckley, near Newmarket, is fostering the automobile movement in that district—hitherto associated mainly with horses.

It is worthy of note that the 30-35-h.p. Metallurgique car which did so well in the Scottish Reliability Trial carried five passengers throughout the journey.

MESSRS. E. AND H. HORA, LTD., the well-known van and omnibus builders, of Camberwell, have built the first body for the "Automixte" motor-bus chassis in record time. The body illustrated herewith was designed, finished, and turned out complete in eight days. It is constructed to carry ten passengers

in the rear compartment and eight in the front, or the smoking division. As will be seen, the vehicle, which is finished in natural wood, has a neat and light appearance.

THE licensed boatmen at Bognor have petitioned the Urban District Council to remove the stand for motor-cars from near the pier, as they consider the competition of the vehicles has injured their calling.

SEVERAL summonses against the London Road Car Company for using motor-buses which did not consume their own smoke have been dismissed by the magistrate at the South-West (London) Police Court.

LONDON-MADE Talbot cars have had three consecutive successes in recent competitions, namely, the gold medal for Frome's Hill climb, gold medal for non-stop London to Edinburgh, and 200 guinea cup for Reliability Trials in Ireland.

OWING to the increasing demand for Brouhot cars the Brouhot Motor Company of Great Britain, Ltd., have recently opened a branch at 92, Gloucester Road, Kensington, S.W., in conjunction with Milano Motors, Ltd. The head office of the company will, however, still remain at 25, Mortimer Street, London, W.

MR. JOHN CUMMING, of Hull, who purchased a "Brown" 12-14-h.p. four-cylinder car in November last, writes that he uses the vehicle every day and in all weathers, and has already run it over 2,000 miles. He reports that it can attain a speed of thirty-five miles per hour, and the petrol consumption is equal to twenty-five miles to the gallon.

MESSRS. VEZEY, carriage builders, of Long Acre, Bath, are repairers of motor-cars.

THE new edition of the Continental Tyre Co.'s handbook for motorists will be published next week.

MR. W. J. SPURGEON, who deals in motor accessories, has opened new premises in Womanbry Street, Cardiff.

AN exhibition will probably be held by the Automobile Association of Bengal, at Calcutta, in December next.

THE Climax Motor Co., Ltd., are considerably extending their factory in Coventry in view of next year's trade.

THE Broadstairs and St. Peter's Urban District Council is about to hire a steam motor-wagon for street-watering purposes.

THE Warwick Motor Garage Company at Bridge Foot, Warrington, are developing a large connection among motorists.

SPALDING'S Athletic Library continues to increase in size and interest, the latest additions dealing with cricket and lawn-tennis.

LOCAL papers have been recording the exploits of Mr. E. W. Preece, of Monmouth, in ascending Birdlip Hill, near Gloucester, on his 3½-h.p. Excelsior motor-cycle in good time.

MR. HASTINGS HOLFORD has opened an office for motor-car insurance at North End Chambers, Croydon, and has issued an attractive booklet dealing with various phases of insurance interesting to owners of cars.

THE Caledonian Tyre Repairing Company, of 52, St. Enoch Square, Glasgow, are repairing and retreading tyres for motorists in all parts of the country. They have received many testimonials as to the quality of their work.

OWING to the increased demand for Imperial tyres, the Imperial Tyre and Rubber Co., Ltd., have opened a West End office and depot at 228, Shaftesbury Avenue, W.C. A full range of Imperial tyres and non-skids will be stocked at this address, which is in a very accessible location for London motorists and the trade in general.

WE illustrate herewith the ingenious combined terminal end electrical nut which has lately been put on the market by Mr.

F. F. Nickells, of Eastcombe Terrace, Blackheath, S.E. As will be seen, it consists of a stirrup-shaped piece of metal in the ends of which holes are formed. Attached to either low or

high-tension wires, the ends of the electrical nut are simply squeezed together until the two holes coincide, when it can readily be placed in position on the accumulator terminal or the sparking plug, the nut automatically locking itself in place. By means of the device the examination or testing of a plug is but the work of a moment, while the ignition wires can be changed over to the spare accumulator in a minimum of time. It is claimed that the nut cannot be displaced by jolting and that it is self-cleaning. Mr. Nickells' latest departure is the adaptation of the idea to tyre inflators, one of his spring devices taking the place of the usual pump connection. Not only is the screwing on and off of the latter obviated, but the one device, which is instantly attached, can be used for any size of valve, from that of a cycle tyre to the largest motor-car tyre. The idea is as simple as it is ingenious.

THE interesting comparative trial between a 30-40-h.p. four-cylinder Martini car and a 30-h.p. six-cylinder Rolls-Royce, under the observation of the A.C.G.B.I., has now been concluded. The two cars were driven from London to Glasgow, then through the Scottish reliability trial, and back to London, in all over 1,600 miles. The Rolls-Royce won the match by 2,277 points to the Martini's 1,881 points, but it is fair to point out that the Martini lost 385 marks under the head of "reliability," owing to the pressure feed of the petrol failing, through a choked pipe, a purely accidental matter which might as easily have happened to its rival. Neither car had a stop caused by any peculiarity of a four or six-cylinder motor. The Martini, without the slight mechanical trouble, would have won, as it scored in hill-climbing, speed, and the important point of fuel consumption. The Rolls-Royce scored in changing gears on hills, reliability, silence, and absence of vibration.

GENERAL BOOTH will commence his third motor tour on July 28th from Inverness, concluding on the 29th August at Plymouth.

FOR the conveyance of mails from Eastbourne in the evening a motor-van was used for the first time on Monday evening in the place of the old two-horsed coach.

AT an inquest at Plymouth the jury have expressed the view "that the speed of a motor-car going through a town should not exceed five miles an hour."

AMONG those who used our columns last week for the sale of their motor-cars was Mrs. Augustine Birrell, the wife of the Minister for Education in the present Government.

MOTORISTS coming south from the North Wales district should beware of the traps in the Whitechurch locality, reference to which will be found in our "Police Traps" this week.

THE proprietors of the Hutchinson pneumatic tyres have taken additional premises at 13, Maddox Street, Regent Street, W., where motorists will find a good display of excellent tyres.

REPLYING to Mr. Money, M.P., on Tuesday, the Home Secretary assured the House of Commons that the speed of motor-buses in London is being watched by the Motor Car Commission.

DURING the course of our visit to Le Mans in connection with the Grand Prix race, we enjoyed a short run in company with Mr. H. Austin on one of the latest Austin cars, and were much struck with its quiet and easy running.

ON the occasion of the South Harting Hill Climb the West Sussex Motor Company, of Chichester, rendered useful service in garaging the cars the night before the event, as well as in supplying spare parts, etc., to several competitors.

MR. T. HOODYDONK has been promoted to the position of sales manager to Argyll Motors, Ltd., at Alexandria. Mr. Hoodydonk has represented the company amongst the agents for the past twelve months, and has many friends in the trade who will be glad to learn of his promotion. He will take up his new duties at Alexandria next week.

A MOTOR-CAR belonging to a Darwen doctor, and containing four people, ran down a steep embankment in Carrington Road, Flixton, on Saturday afternoon, into the Mersey, at a point where it is 5 ft. deep. Fortunately the passengers were rescued little the worse for their adventure. They went to an adjoining farm, where fresh clothes were obtained. The motor-car was not seriously damaged.

FROM Messrs. Mestre and Blatge, of Paris, we have received one of the most complete catalogues of motor-car parts and accessories that has so far come under our notice. The list runs to close upon 200 pages, and includes everything that the motorist or motor-car repairer is likely to require. We may add that Messrs. G. M. Monnet and Co., of 9-15, Oxford Street, London, W., have been appointed British agents for Messrs. Mestre and Blatge.

AT Manchester, Messrs. Humber, Ltd., have opened a new depot at 31, Blackfriars Street, which, on the invitation of Mr. F. C. Hunt, we inspected last week. The showroom is very elaborately fitted and capable of accommodating twenty-five motor-cars. A large workshop for all kinds of repairs occupies the basement. The Humber Company are to be congratulated on having secured such a well-appointed and commodious depot, which should do much to extend the reputation of the cars associated with their name.

IN a recent contest at a place not inappropriately named Dead Horse Hill, at Worcester, U.S.A., a Pope Tribune car outclassed many of its rivals, ascending a hill of steep ascent in quicker time than several other well-known vehicles. It was a Pope Tribune car of 14-h.p. which was third in point of speed in its class in the "Rest and be Thankful" hill climb on the fourth day of the Scottish Reliability Trial, and which had non-stop runs on each day in that event save the last, when engine stops of twenty-eight minutes spoiled an otherwise splendid record. In the table published in our report of the trial a N.S. has now been credited for the third day, where no report originally appeared in the preliminary official returns.

Letters to the Editor should be addressed to the offices,  
27-33, Charing Cross Road, W.C.]

### STEAM CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I read with interest a letter in the *M.C.J.* issue of the 23rd ult. relative to the hill-climbing powers of steam cars, but I think that the gradients mentioned must be somewhat overstated. A hill is referred to on a by-road near Dorking where the gradient is 1 in 3½ in one part. Will your correspondent state the name? I have heard of hills of 1 in 6 being called "1 in 3," and have found it difficult to convince a motorist that a 1 in 7 hill was not (as he believed) "1 in less than 5." The entrance to the Aldwych tram tunnel is 1 in 10, yet to stand by it and watch the trams drop down the incline I should easily have believed it to be 1 in 7 or 8. I confess, however, to scepticism that any 10-h.p. (even steam) car would romp up a grade nearly three times as severe at anything like fourteen miles an hour! I was once in a Clarkson omnibus that

that, had I left the car with him and accepted the cheque, it would not have been me. It certainly does look to me strange that, after he was so well satisfied with the car, the mere asking for actual cash instead of a cheque should have prevented anyone from proceeding with the transaction. May I strongly advise anyone who is thinking of selling their car not to part with it until they have the actual money in their possession? Nothing could be simpler than for a swindler to obtain possession of a car by handing over a cheque which might prove a worthless document. For obvious reasons I withhold all names in my case and I merely send this letter as a warning to others.—Yours truly,  
A YORKSHIRE MOTORIST.

### AN INSPECTION PIT DANGER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—An event occurred in our erecting shop which was only by a fluke prevented from being a fatal accident, and which points to the necessity of wide-spread caution in the use of petrol in confined spaces. One of our young men was cleaning out the inspection pit, and, after swabbing up the water and grease, he, without permission, got some petrol and washed the bottom and sides with it. He was overcome with the fumes and collapsed in the bottom of the pit, and had not one of my sons heard a peculiar noise, and gone to see what caused it, would undoubtedly have been choked, as he found him black in the face. My son jumped in at once and lifted the lad up, and with assistance got him into the fresh air; but, as many young men and boys are often working in pits

Manchester's Crippled Children leaving the Town Hall for an Automobile Outing. (See page 420.)

climbed a pitch 1 in 4·7, even restarting at the steepest part, and that was a somewhat exciting experience.—Yours truly,

ENGINEER.

### THE PRIVATE SALE OF CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I think perhaps a word of warning may be useful to those who are advertising their cars for sale. I recently inserted an advertisement, and a man whom I had never seen before came over from a neighbouring town and asked to see the car. I gave him every facility for inspecting it and a short trial run, and he offered me a very good price subject to his being satisfied after a run of about twenty miles, which was to take place on the following day but one. He told me that if I would take him to his native town and the car ran well on the journey he would give me a cheque and I might leave the car and all the accessories with him. I knew nothing of this proposed purchaser except that he stated he was a traveller and that his headquarters were at a very well known first-class hotel in the town where he wanted me to drive him to, so before going on the trial run I took the precaution of writing him what I considered a very civil letter telling him that, as a matter of business and because I did not know him personally, I should be glad if he would let me have either bank notes or a banker's draft instead of a cheque. I thought that, as a business man, he would immediately comply with this request and see the force of it, but, instead of that, I received a telegram saying that in consequence of my letter he had decided not to proceed further with the purchase. I have never heard a word from him since. I cannot say for certain

and do not realise that petrol vapour sinks to the bottom, and is about as unwholesome to breathe as carbonic acid gas, it cannot be too widely known what a dangerous practice it is to use petrol for cleaning in any confined space. Apart from the known danger from fire, there is also the danger of suffocation, and once anyone is overcome and unconscious they would very soon die, unless help arrived.—Yours truly,

C. S. DREWRY.

### CARE IN FILLING PETROL TANKS AT NIGHT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—A deplorable accident, which emphasizes anew the great danger involved in filling the petrol tank of a motor-car while the lamps are burning, occurred last week. The lamps of the car were already lighted, and an employee of the garage proceeded to fill the tank of the vehicle. When he had finished he inadvertently held the funnel close to one of the lamps; the vapours rising from the funnel immediately caught fire and the flames were communicated to the still open tank. A big column of flame shot up at the side of the car, and one of the passengers, who were already seated on the vehicle, was severely burned. This is not the first time that petrol has caught fire owing to the fact that the tank was being filled while the lamps were alight, and attention had repeatedly been called to the danger involved. It would appear, however, that little heed is given to such warnings, and I venture to suggest that all garage owners should consider it their first duty to issue rigid and repeated instructions to their assistants as to the precautions to be observed in handling petrol. In fact, if the subject of safety from petrol fires were taken up by some organisation of garage

owners, their combined experience would undoubtedly permit of some simple set of rules being formulated that could easily be applied, and, if followed, would practically exclude the possibility of accidents of this nature.—Yours truly,

W. JAMIESON.

### METHODS OF AGENTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be glad if you would insert in your interesting and widely-read journal the following as a warning to motorists who go to a well-known western resort. I arrived there on Thursday, and, after enquiring where I could get oil and petrol, was informed that Messrs. ——— could supply me. I ordered half gallon oil and asked that two tins of petrol might be sent up, and on enquiring of the firm was told that should I not use all the petrol they would refund me the amount of the difference. On Friday morning, when I came to fill up my tank, I only used  $1\frac{1}{2}$  tins or  $2\frac{1}{2}$  gallons, but the firm would not allow me anything back.

I had no opportunity of then settling the matter to my satisfaction as I could not wait, but I determined to let my fellow-motorists know of what I consider nothing more nor less than a "do." I have travelled all over England, and always have had allowance made of what petrol I did not use out of a tin.—Yours truly,

F. L. POWYS MAURIA.

### EXPERIENCES OF TYRES WANTED.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Will some of your readers give their experiences of Moseley's Perfect Tyres? I am putting these to a very severe test, so far with satisfaction, but I want to hear what others have to say.—Yours truly,

HENRY MOORE.

The 40-h.p. De Dietrich just supplied by Messrs. Jarrott and Letts to the Duke of Portland. The chassis has been fitted with a very luxurious limousine body, specially designed for the use of the Duke and Duchess.

### CHANGE-SPEED GEAR PROPORTIONS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The three speeds of my car are designed to give 9, 18, and 27 miles per hour respectively. In practice, however, I find the second speed of but little use, for when ascending a hill too steep to take on top speed without the engine knocking, I have almost invariably to drop to first. I should like to have your opinion, and also those of any readers of the *M.C.J.*, whether it would be an advantage to have the proportions of the second speed reduced so as to give, say, 14 or 15 miles per hour.—Yours truly,

R. CARNFORTH.

[We are afraid that our correspondent would not benefit much by lowering his second gear from 18 miles per hour to 14 or 15, as this amount would hardly be noticeable. No doubt if the gear were changed before the engine slowed down this would somewhat remedy matters. We find this to be the case with a 20-h.p. Darracq car. In climbing hills, if the engine is allowed to labour on top speed before the change on to second is made, we invariably have to drop to first, but if the change is made before the engine slows down we can climb without difficulty. We think in all probability that this may be the cause of the trouble.]

### SOLID TYRES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to W. J. A., I can most strongly recommend him to discard his pneumatic tyres in favour of solids. According to my experience he will find nine-tenths of his worries and expenses will instantly disappear. The difference in comfort of the car in running with solids on back wheels is scarcely perceptible, except on very rough roads,

where he will have to moderate his speed somewhat. To make a thorough success of the change, I should advise W. J. A. to have a new pair of back wheels of considerably larger diameter, and, unless his car is very well sprung, new and longer springs, at the same time reducing his chain drive to suit the new diameter of wheels. I rather doubt whether solids could be fitted to the present rims, but W. J. A. can soon ascertain this from any one of the firms advertising solid tyres in the *M.C.J.* For a car of his weight I should say 2 or  $2\frac{1}{4}$  in. tyres would be about the size.—Yours truly,

J. BRYANT.

### OPERATING A MOTOR SIGNAL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have a small 8-h.p. De Dion car, and I have just purchased a set of motor tubes instead of the usual horn. I have tried to operate them with a pair of bellows to be worked by the feet; but this, I find, is not strong enough to blow the four tubes, but only two of them. Can you oblige me by telling me the best way to have them fitted to my car? I have been advised to use the exhaust, but I do not think this is quite practicable because of the fact that sometimes the engine is not running when one wishes to give notice of approach. Thanking you in anticipation.—Yours truly,

A. LUCAS.

[The motor tube could be arranged to be worked from a small fan working off the fly-wheel, similar to those used for cooling air-cooled motor-bicycle engines. This method should give better results than working off the exhaust, as this would not give sufficiently continuous pressure, being only a single-cylinder engine.]

### TESTING A MAGNETO.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In a recent issue you published a useful and interesting note with regard to the remagnetisation of weakened magnetos. As a simple amateur who has already obtained much help from the *M.C.J.*, I venture to ask if you will be kind enough to explain how one may judge when a magneto has become weakened, and how the machine may be tested as to whether it is generating the proper strength of current.—Yours truly,

T. J. BENTLEY.

[A reply to the query raised by our correspondent will be found elsewhere in the present issue under the heading "Current Topics."]

### MAGNETIC SPARKING PLUGS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—A year or two ago considerable interest was aroused by the placing upon the market of a system of ignition which involved the use of vibrating magnetic plugs operated from a battery and arranged to automatically rapidly interrupt the primary circuit and produce a succession of contact sparks within the cylinder, when the circuit was closed by means of a contact maker. It was, if I remember rightly, known as the Simplex, and was followed by several others differing only therefrom as regards the details. Such a system of ignition might be thought to possess important advantages, as it might be expected to combine, in a degree, the advantages of the usual methods of high and low tension ignition, and to be free from some of their disadvantages. As a matter of fact, very little has been heard, of late, of this apparently quite promising ignition system, and it may be inferred that, in the particular form in which it was applied, at least, it did not fulfil expectations. No doubt technical difficulties were encountered in the practical operation of the somewhat delicate vibrating mechanism which caused the make and break, exposed as it must necessarily be to a high temperature. It seems a pity, however, that the idea has not been further developed, for the doing away with the multiplicity of cams, push rods, springs, trip devices and moveable electrodes piercing the combustion chamber walls of low tension systems, and the more complicated high tension magneto method, and allowing the ignition current to interrupt itself and cause the contact spark by means of a simple mechanism compactly contained in a readily removable plug, is an attractive idea.—Yours truly,

J. SUTHERLAND.

THE AKONIA SYNDICATE's address is 120-122, Birkbeck Bank Chambers, London, W.C.

MOTOR TYRE REPAIRS.—A correspondent at Oban writes testifying to the good repair work done by the Acme Rubber and Tyre Company, of 343, St. Vincent Street, Glasgow. He sent them two covers to be repaired and retreaded according to their three months' guarantee, and to be fitted with "grooved treads." He received the covers back and has since run 2,000 miles or over, and they look as good almost as when new.

MOTOR CAR PARTS FOR JAPAN.—The Automobile Department of the Sorin Shokwai of 5, 3-Chome, Ginza, Tokyo, Japan, writes:—"We shall be glad if you will bring to the notice of manufacturers of automobile parts in your country that we are anxious to place an order for such goods, and would like them to post us their catalogues and illustrations, and also full particulars as to the net price, discount and freight charges to Japan."

## CLUBS AND ASSOCIATIONS.

### THE AERO CLUB.

A RACE under the Aero Club's International Federation Rules takes place at the Ranelagh Club, Barnes, S.W., to-day (Saturday). The balloons will be followed by motor-cars, and the Committee of the Ranelagh Club are offering a prize to members of that club and of the Ladies' Automobile Club for the first motorist to capture a balloon. The Aero Club of Belgium have sent an invitation to the Aero Club of the United Kingdom, asking them to compete in a competition to be held at the Parc du Cinquantenaire, Brussels, on July 22nd. This competition is a "Hare and Hounds," or Pursuit race.

### THE NEW FOREST CLUB.

THE headquarters of the newly-formed New Forest and Bournemouth Automobile Club will be at the Balmer Lawn Hotel, Brockenhurst.

was to smash with the front wheel small balloons pegged down at intervals, time limit 1 minute, Mr. R. C. L. Powys-Lybbe (Mapledurham) on a 60-h.p. Mercedes, won in 27 2-5 sec.; Rev. J. W. Ouvry (Grazley), driving a 15-h.p. Darracq, being second in 39 sec. In a tilting at the ring contest, the time limit was a minute and a half, with a penalty of three seconds for each ring missed. Dr. W. B. Secretan (Reading), 6-h.p. Swift, was first with five rings in 58 sec., counting 61 sec. with one penalty; Mr. F. T. Ford (Kimbers), 24-h.p. Spyker, coming second with two rings in 50 2-5 sec. (equals 62 2-5 sec.) In a potato race six flower-pots were placed at different points along the 375 yard course, and competing drivers had to throw a potato into each, no stops being allowed, and the time limit being a minute and a half. Mr. E. B. Stephens (Taplow), 7-h.p. Panhard, proved most skilful with five successes in 62 3-5 sec., Mr. Walter L. Bourke (Maidenhead), 8 h.p. Cadillac, coming next with four successes in 61 sec. Mrs. Harrison subsequently distributed souvenir prizes to the winners.

### LINCOLNSHIRE.

THE Earl of Ancaster's picturesque park at Grimsthorpe was the scene of some interesting competitions on Saturday. The meeting was held under the auspices of the Lincolnshire A.C., and Dr. Gilpin, of Bourne, entertained the members to a picnic. The weather was delightfully fine, and the roads in splendid condition after the recent rain, so that cars travelled from all parts of the county. Upwards of 30 put in an appearance. The principal cars were, Capt. Newsum's (Lincoln)

The Aston Hill Climb.—Mr. J. E. Lound's 24-h.p. Beaufort Car at the Starting Point. (See page 413.)

Lord Montagu of Beaulieu is president, and it has been decided that the executive committee shall consist of eighteen members, a third of the number to retire annually. The following were appointed at the initial meeting of the organisation, with power to add to their number:—Col. Roberts Thomson, Dr. H. Simmons, Mr. H. E. Acklom, Mr. C. J. Haydon, and Dr. N. MacGillycuddy, of Bournemouth; Mr. Peyto Shrubbs and Dr. A. D. Pithie, of Lymington; Mr. H. G. Alexander, The Old Mansion, Boldre; Mr. Charles Braun, Sowley House, Beaulieu; Major Stuart Murray, New Milton; Mr. S. V. Coote, Burley Manor; Mr. Grant-Dalton, Brockenhurst; Mr. B. C. S. Pearce, Loperwood Manor, Totton; and Dr. Aldridge, Southampton. At a subsequent meeting of the Committee Mr. Peyto Shrubbs was elected chairman, Dr. H. Simmons, hon. treasurer, and Mr. Clement J. Haydon, of Westover Chambers, Bournemouth, hon. secretary.

### BERKSHIRE.

MR. and MRS. ROBERT C. H. HARRISON entertained members of the Berkshire Automobile Club at Shiplake Court, Henley-on-Thames, on Saturday, when a motor gymkhana was held in the park. The first event, a bending race, over a course of 440 yards, was won by Mr. W. Littleton (Streatley), with a 28-h.p. Daimler, in 1 min. 12 3-5 sec.; Major E. R. Peral (Hungerford), 10-h.p. De Dion, being second in 1 min. 14 2-5 sec. The next event was a passenger race, which was won by Mr. E. P. Stephens (Taplow), 7-h.p. Panhard, in 1 min. 48 sec., Mr. D. D. Coath (Holyport), being second in 2 min. 24 sec. Mr. Coath, who had occupied only 1 min. 5 sec. in the semi-final, lost his course, and had to return. In a bomb race, over a course of 375 yards, in which the object

30-h.p. Daimler; Mr. T. W. May's (Bourne), 15-h.p. De Dion; Major Cole's (Roxholm Hall), 16-h.p. Humber; Mr. Coombes' (Lincoln), four-cylinder Richard-Brasier; Major Goddard's 16-h.p. Clement Talbot; Dr. Husband's (Crowland), 16-h.p. Spyker; Mr. W. J. Newsum's 15-h.p. Panhard; Mr. Padley's (Market Rasen), 15-20-h.p. Humber; Mr. G. H. May's (Bourne), 12-h.p. Iden; the Rev. M. J. Wilkins' (Croft), 10-12-h.p. Argyll; and Mr. Bowler Gibson's (Bourne), 12-h.p. Richard-Brasier.

The competitors, of whom there were fourteen, had to specify before starting at what speed they intended to travel over the course (the nearest to their own speed to be the winner), and the spectators were asked to guess the pace at which the cars travelled. When the cards had been checked it was found that the driver's prize had been won by Dr. Miller, of Wrangle (who averaged his speed at 14½ miles per hour); the spectators' guessing prize was won by Miss Chapman.

### LADIES.

THE second of the Ladies' Automobile Club meets for the present season took place on Wednesday of last week, by invitation of Major and Mrs. H. C. Turnor, at Binfield Park, Bracknell, Berks. Twenty-five cars took part in the event. These made a most imposing array of many different makes. In all there were one hundred and eighty guests, among them being Mrs. Ainslie, Mrs. Ash, Colonel and Mrs. C. Bingham, Mr. and Mrs. Buttemer, Baron and Baroness Campbell von Laurentz, Captain and Mr. Carden, Mrs. Cross, Mrs. P. Dawson, Mrs. English, Mrs. Louis Fagan, Mrs. Friedlander, Lady Daldon Fitzgerald, Mrs. F. Foster, Miss Howes, Mr. Hartung, Lady Buchanan Jardine,

Mrs. Jardine of Jardine, Lady Alexander Kennedy, Mrs. Lesmoir Gordon, Mrs. H. S. C. Gordon, Sir W. and Lady Miller, Colonel and Mrs. Mead, Sir R. and Lady Wilmot, Mr. Mackenzie, Mrs. Malet, Miss Austin-Jackson, Mrs. Garden Nicol, Miss Orpen, Mrs. Ernest Rhodes, Mrs. Gordon Theed, Mrs. Arbuthnot, Mr. H. C. Lafone, Mr. and Mrs. Campbell Farrar, Mr. J. Simon, Lady Clementine Walsh and the club secretary, Miss d'Esterre-Hughes.

The next of the club meets will be, by invitation of Mrs. Walter, at Bear Wood, Wokingham, on Thursday, the 26th of July.

Sir David Salomons, who drove down with several other members of the Coaching Club to luncheon at the Ranelagh Club on Saturday, officiated as one of the judges at the automobile gymkhana that was held there in the afternoon. The competitors, twelve in number, were all members of the Ladies' Automobile Club. Mrs. T. B. Browne won both the ball race and the "police trap" race. Mrs. Manville was the winner of the bending race, while Mrs. Campbell Farrar was successful in both the crawling race and the tilting at the ring competition. There was also a competition for touring cars, in which the first prize for the general appearance of car and occupants was awarded to Mrs. Ernest Amesden, and the smartest car suitable for the park was adjudged to be Mrs. Harry Adams's 10-h.p. Adams-Hewitt carriage. The prizes were presented by the Duchess of Sutherland.

### BLACKHEATH.

ON Saturday, at the Knockholt Cricket Ground, a cricket match was played by the Blackheath Automobile Club against Mr. Walsley's eleven, the former team being composed as follows:—Messrs. A. W. Beadle, L. Beadle (capt.), H. A. Cunis, A. Jackson, Professor Lambert, F. Thorne, E. Thorne, junr., C. Marshall, S. Marshall, A. E. Toothill, and W. Waite.

### THE LEEDS MOTOR-CYCLE CLUB.

THE Leeds Motor-Cycle Club have a membership of 150, fifteen new members having been elected at a committee meeting on Friday last week. On July 21st they are holding a reliability competition, Leeds to Edinburgh and back, for a cup given by Mr. A. I. Greenwood, to become the absolute property of the winner. The second prize is a gold medal presented by Mr. H. Crowther.

### LEICESTERSHIRE.

THE Leicestershire Automobile Club held a motor-car gymkhana at Garendon Park on Saturday. The park was placed at the disposal of the club by Major E. de Lisle (High Sheriff of the county). The officials were:—Judges, Major Everard de Lisle and Dr. Burkitt; marshal, Mr. A. H. Faulkner; starter, Mr. Orson Wright; timekeeper, Mr. F. K. Ward; clerks of the course, Messrs. J. and R. Harding, C. T. King, R. S. Clifford, and T. W. Hodson; hon. secretary, Mr. A. McAlpin.

There were six events, the first being a glass of water race. Of eighteen competitors, C. P. Maltby was first and W. Bentley second.

The second event was the "Adam and Eve Race." Result: J. A. Doran 1, Captain Byron 2. In the obstacle race R. S. Clifford was first and second. He drove two cars, and after winning the first prize went on again and did the course in much quicker time than at first. Event No. 4 was a ladies' passenger race. Result: W. Bentley 1, Spencer Downing 2. The fifth event was a ladies' obstacle race, and the conditions were the same as in the other race, but the cars were driven by ladies. Result: Miss Lucy Hodson 1, Miss Lane 2. The result of the tilting at rings contest was Captain Byron 1, J. A. Doran 2.

Mrs. Everard de Lisle presented the prizes to the successful competitors. On the motion of Dr. Burkitt, seconded by Mr. E. G. Mawbey (President), a vote of thanks was given to Mrs. de Lisle for presenting the prizes, and to Mr. de Lisle for the use of the park.

### NORTH-EAST LANCASHIRE.

THE formal opening of the new club rooms which the North-East Lancashire Automobile Club have recently acquired in Blackburn has just taken place. Mr. William Birtwistle was in the chair. About fifty members were present at the opening, and afterwards a smoking concert was held. In the course of the evening Mr. Arthur Birtwistle gave some interesting reminiscences of the recent Herkomer competition in Germany, in which he took part, but was put out, when doing well, by an accident.

ENTRIES for the next quarterly trial of the Auto Cycle Club close on Wednesday next.

THE Leeds Motor Cycle Club will hold a ride from Leeds to Edinburgh and back on July 21st.

THE Automobile Club of Great Britain and Ireland have made a contribution of £200 to the Legal and Legislative Defence Fund of the Motor Union.

THE first open reliability run for motor-cycles in Scotland has been held by the Dunedin Motor Cycle Club, of Edinburgh. The course was one of 104 miles, and of nineteen starters eight finished in the minimum time.

## HILL CLIMBING CONTESTS.

### IRELAND.

THE Irish A.C. intend holding an open hill climb in the neighbourhood of Dublin on Saturday, the 4th August next, with the following classes:—

- CLASS A.—Cars, the chassis price of which does not exceed £200.
- CLASS B.—Cars, the chassis price of which does not exceed £350.
- CLASS C.—Cars, the chassis price of which does not exceed £500.
- CLASS D.—Cars, the chassis price of which does not exceed £800.
- CLASS E.—Cars exceeding £800.

Silver cups and silver medals will be given in each class.

### LEEDS.

The results of the hill climb held by the Leeds Motor Cycle Club in the Earl of Harewood's private grounds on June 23rd have now been worked out by the Auto-Cycle Club's formula as follows:—

		Figure of Merit.
1st (winner of Triumph Cup and Gold Medal), Mitchell,		
3½-h.p. Minerva	...	12
2nd, Ward, 3-h.p. Triumph	...	11.6
3rd, Steel, 3 h.p. Triumph	...	11.5
4th, Wrigley, 3½-h.p. N.S.U.	...	11.2
5th, Liversidge, 3½-h.p. Quadrant	...	11.18

Mr. Allison, of Castleford, on a 5½-h.p. G.B. obtained a certificate of merit for fastest time.

### SOUTHERN.

The Southern Motor Club held their series of hill-climbing contests (for members only) at Tilburstowe Hill, Godstone, on Saturday. The elements proved kind and favourable, and crowds were attracted from all parts, as in addition the Southern Counties Cycling Club held their annual events in the afternoon on the same hill. In the motor events some forty machines competed, and the chief event of the day was the tourist cars, for which there were twelve entries, Mr. H. Billing making fastest time on his 10-12-h.p. Humber; Mr. H. Jones on a 6-h.p. Wolseley was 22 seconds slower, and Mr. Philpot's 6-h.p. Siddeley was 6½ sec. slower than the Wolseley. Then came Mr. C. Pattison, 8-11-h.p. Panhard, 20 sec. slower than the Siddeley; Mr. Nixon, 6-h.p. Regal, 29 sec. slower than the Panhard; and Mr. Wall on a 6-8-h.p. Swift was 39 sec. slower than the Regal. Mr. C. Pattison proved an easy winner on handicap points, with Mr. Nixon second. In the Geared Tri-car Class Mr. Bert Pattison on his 14-16-h.p. two-cylinder Daneville proved an easy winner; Mr. T. H. Tessier in the single-gear Tri-car Class also proved victorious.

The motor-cycles brought forth a very large field, but in both events, viz., 85 by 85 and any-size engines, Mr. Davies was the winner on a 3-h.p. Davy. The times were taken by Mr. Burley and Mr. Allen Vickers. Mr. A. Clifford Earp was a visitor on a 35-40-h.p. Iris car and was timed up the hill.

### SOMERSET.

On Saturday the Somerset Automobile Club held a hill-climbing competition on Puritan Hill, Bridgwater, with the following results:—

Car.	Owner.	Marks Gained.
O. H. Bayldon	22-h.p. Minerva	82
C. E. Burnell	10-12-h.p. Argyll	72
R. B. Graves-Knafton	10-12-h.p. Argyll	71
W. A. Taylor	10-12-h.p. Humber	64
P. F. C. Elwes	24-30-h.p. Bridgwater	63
C. H. Daws	12-h.p. Wolseley	59
R. Orme	8-10-h.p. Humber	58
J. W. Aspinall	14-h.p. Minerva	57
F. Wills	12-h.p. Clement	52
O. H. Bayldon	5½-h.p. Baby Peugeot	46
A. Armitage	10-h.p. Forman	44
H. E. S. Viner	6-h.p. Pick	43
W. J. Hippisley	8-10-h.p. Humber	39

The hill is of considerable length and steepness. There were five classes, arranged according to the chassis price of the car, and some capital runs were witnessed. Excellent arrangements had been made by the Hill Climbing Committee, of which Mr. J. W. Aspinall, of Weston-super-Mare, was the hon. secretary. The other officials were:—Starter, Mr. S. Austin; marshals, Messrs. A. Armitage and Dr. Benson; timekeepers, Messrs. C. H. Daws, F. Wills, and J. W. Aspinall; clerk of the course, Mr. P. F. C. Elwes.

### ASTON HILL.

Splendid weather and the kindly feeling of Mr. Alfred de Rothschild enabled the Hertfordshire County Automobile Club to achieve a notable success with their hill climb on Saturday. This took place on Aston Hill and attracted a large number of well-known motorists. The hill climb is 1,290 yards in length, with an average gradient of 1 in 18, the steepest portion being 1 in 7. There were forty-five competitors and the fastest time was made by Mr. E. M. C. Instone on a 35-h.p. Daimler, with Continental tyres, a trophy being presented for this event. Mr. Coleman, on a White steamer, was the happy recipient of a silver cup. The member of the club unconnected with the trade who made the best handicap performance was Mr. W. F. Young, driving a 10-h.p. Alldays, and he carried off for the present year the handsome challenge cup presented to the club for this performance by Mr. E. T. Prvor.

The winner of the handicap for petrol-propelled vehicles was Mr. T. Thornycroft, who drove a 14-h.p. Thornycroft.

The most meritorious performance has not been allotted, for twelve cars came out with equal points. It has therefore been decided to hand the prize for this event to the second in the handicap for the petrol cars, namely, Messrs. Alldays and Onions, whose 10-h.p. Alldays was piloted by Mr. Huband. The medal for the third best handicap performance goes to Mr. H. Ramoisy, who was third in this event with a 14-h.p. Germain.

The officials of the day were:—Judge, Mr. C. McWhirter; clerks of the course, Messrs. W. G. James, N. Kenealy, E. T. Pryor; marshal at foot of hill, Mr. A. J. Salmon; marshal at top of hill, Mr. M. Arnold; chief signaller, Mr. H. L. Gibbs; clerk of the scales, Mr. E. Kenealy; clerk of results, Mr. C. Wheeler; assistant clerk of results, Mr. G. Ransley; timekeepers, Messrs. A. V. Ebbelwhite and F. Straight; secretary of meeting, Mr. T. Williams.

Of course the police all round about the district were pretty active—as we anticipated they would be in our last issue—and it was particularly hard luck on one competitor that a hay cart should get upon the course when he was ready to start. In all these performances the presence of the White steam car has lately been a source of public attraction, hence the regret that Mr. F. Coleman's time should have been spoiled by the movement of a vehicle which caused him to slow down when he had got into a very fast run towards the top of the hill.

The fastest times (all classes) were as follows:—

Order of Merit.	Car No.	Name of Car.	Driver.	Time in secs.	Positi'n. in Hndp.

#### BIRDLIP HILL.

About seven miles on the main road from Gloucester is the Birdlip Hill—a place of renown as among the worst on English roads, being stiff of ascent and of a sinuous twisting course throughout. On Saturday last the Bristol and Gloucestershire Automobile Club held a hill-climb there, the event attracting forty-nine entries, and the results being as follows:—

CLASS A.—For cars of a selling price not exceeding £300; 1, H. G. Norton, 10-12-h.p. Coventry Humber; 2, Rev. P. Cane-Moyle, 8-10-h.p. Coventry Humber; 3, E. Grindley, 8-10-h.p. Coventry Humber. Other competitors, placed according to the merit of their performance, were: A. S. Bartholomew, 8-10-h.p. Coventry Humber; W. J. Bridges, 8-h.p. Rover; H. E. Steel, 10-h.p. Adams Hewitt.

CLASS B.—For cars of selling price between £300 and £550:—1, H. G. Norton, 16-20-h.p. Beeston Humber; 2, W. Stayt, 16-20-h.p. Beeston Humber; 3, A. E. Johnson 14-18-h.p. Spyker; 4, E. N. Gwyther, 20-32-h.p. Darracq; 5, Capt. Tudor Owen, 12-16-h.p. Clement Talbot; 6, H. E. Steel, 15-h.p. Siddeley. In Class C, G. S. Davey, 30-40-h.p. Daimler, was first.

The handicap placings were as follows:—In Class A the first three were H. G. Norton, 10-12-h.p. Coventry Humber; A. Le Blond, 8-h.p. De Dion; W. J. Aubrey, 8-h.p. De Dion; and in Class B, Captain T. Owen, 12-16-h.p. Clement Talbot; H. G. Norton, 16-20-h.p. Beeston Humber; and E. A. Streatham, 10-12-h.p. Clement-Talbot.

ON Saturday last the staff of Messrs. Brown Bros. held their outing to Worthing, where a field for racing was prepared by Mr. Blaker, a local motor agent. Prizes were distributed by Mr. Ernest Brown.

## THE ROYAL AGRICULTURAL SHOW.

THE machinery section of the Royal Agricultural Show held at Derby last week comprised a representative collection of steam wagons and tractors, all the well-known makers being present. A newcomer in the field of steam wagon builders was Messrs. Robey and Co., Ltd., Lincoln, who had on view a five-ton vehicle fitted with a combination smoke tube and water tube boiler, and two-cylinder (simple) horizontal engine. Two speeds are provided, the transmission being by gearing on to a live axle. Other exhibitors of steam wagons included Messrs. Fodens, Ltd., Sandbach; Mann's Patent Steam Cart and Wagon Company, Leeds; the Yorkshire Patent Steam Wagon Company, Leeds; Messrs. Wm. Allchin, Ltd., Northampton; Messrs. Jesse Ellis and Co., Ltd., Maidstone; Messrs. E. S. Hindley and Sons, Bourton, Dorset; Messrs. Pratchitt Bros., Carlisle; the St. Pancras Iron Work Company, London; Messrs. Wallis and Stevens, Basingstoke; and Messrs. R. Garrett and Sons, Ltd., Leiston.

Steam tractors designed for use in accordance with the regulations under the Heavy Motor-Car Order were exhibited by Messrs. Aveling and Porter, Ltd., Rochester; Messrs. Ruston, Proctor and Company, Lincoln; Messrs. Wallis and Stevens; Messrs. Wm. Foster and Company, Lincoln; Messrs. R. Garrett and Sons, Ltd., Leiston; Messrs. Clayton and Shuttleworth, Lincoln; and Messrs. Chas. Burrell and Son, Thetford; Messrs. Robey and Company, Ltd., Lincoln; Messrs. J. and H. McLaren, Leeds.

A new 30-40 cwt. petrol lorry was displayed by Messrs. Horn, Littlewood and Company. The vehicle was fitted with an Aster engine, but in future a motor having twin cylinders 5 in. bore by

The Aston Hill Climb. Mr. S. Kennedy at the wheel of Mr. T. H. Woollen's 12-16 Clement-Talbot Car.

5 in. stroke, and developing 15-b.h.p. at 900 revolutions per minute, is to be employed. Three speeds are provided, the final drive being by roller side chains. The road-wheels are shod with Hopkinson's tyres—4 in. on the front and 3 in. twin on the back. Messrs. H. P. Saunderson and Co., of Bedford, exhibited a new model of their universal motor, with combination fittings. The machine is of 30-b.h.p., and is provided with three speeds and reverse. The new carburettor is arranged to work with either petrol, alcohol, or common oil as fuel. The motor may be used: (1) as a three-wheeled agricultural tractor, with all three wheels propelling, for hauling and driving machinery; (2) as an ordinary motor lorry to carry four tons; (3) as a fore carriage for attaching to and working binders, mowers, ploughs, and wagons. Messrs. Barford and Perkins, Peterborough, were present with their motor rollers, a new departure being the fitting of an engine designed to use paraffin as fuel in place of petrol. Messrs. Thos. Green and Son are also now making a motor roller on similar lines. Messrs. Jas. B. Petter and Sons, Ltd., Yeovil, exhibited a petroleum tractor. It is fitted with a 22-b.h.p. horizontal engine of the slow running type, using ordinary paraffin as fuel. The drive is by a roller chain on to the live axle, two speeds and a reverse being provided. The machine is designed to haul loads of from four to five tons. Motor lawn-mowers were exhibited by Messrs. Ransomes, Sims and Jeffries, Ipswich, Messrs. Alexander Shanks and Son, Ltd., Arbroath; and Messrs. Thos. Green and Son, Ltd., Leeds. Among miscellaneous exhibitors were Price's Patent Candle Company, Ltd., Battersea, and Messrs. W. H. Wilcox and Company, Ltd., London, S.E.; the latter's display included not only lubricating oils, but also pumps, lubricators, and many other automobile accessories.

## CHILDREN AND MOTORING.

PATHETIC, yet pleasant, was the impression gained by the observer in Albert Square, Manchester, on Saturday afternoon, where three or four hundred crippled children of the city were gathered for a ride in the eighty-four motor-cars placed at their service. The trip was organised by the Crippled Children's Aid Society, which has about 800 cripples under its care. The cars were found by members of the Manchester Automobile Club and the Manchester Motor Club. The presidents of these clubs—Mr. J. A. Morris and Mr. Sawley Brown—were present, and the procession was led by Mr. W. Hyde. The Lord Mayor and the Lady Mayoress were there to see the party off and wish them a happy day. The route taken was by Mount Street and Stretford Road, though Stretford, Sale, Brooklands, and Altrincham and Knutsford and Chelford to Worth's Farm at Siddington, where the Union Jack was flying as a sign of welcome. Here the children rested and played for two or three hours, and had tea and other refreshments at the cost of their friends the motorists. The return journey was by way of Alderley Edge and Wilmslow. The committee who carried out the arrangements were Mr. W. Hyde, Mr. Sawley Brown, Mr. C. B. Holmes, and Mr. W. Cotsworth (hon. secretary). Four medical men went with the trip to be ready to help in case of need.

## THE MOTOR-CYCLE RECORD.

ON the Canning Town track, H. Collier has made an attempt on the 100 miles motor-cycle record. He actually succeeded in beating all previous times from the fifty-fifth mile onward. Had he not lost five minutes from a puncture, he would have been well inside two hours for the 100 miles. The first mile was performed in 1 min. 20.2 sec., and 55 miles in 65 min. 29.1 sec., 8 min. 24.5 sec. ahead of Harry Martin's previous best. The 100 miles time was 2 hrs. 2 min. 19 sec., beating the old record by 19 min. 26 sec., also held by H. Martin. In two hours Collier rode 97 miles 1,640 yards, against Martin's 85 miles 1,680 yards, an increase of 11 miles 1,720 yards. Mr. A. V. Ebbelwhite was responsible for the time-keeping.

ON the same track the Essex Motor Club will hold a motor-cycle meet on the 14th inst., when the competitors will include Giuppone, the holder of the World Record for one hour—63 miles, and René Thomas, who successfully competed at the Crystal Palace last year for the M.C.J. Trophy.

## NEW COMPANIES REGISTERED.

F. GROOME, LTD.—Capital, £5,000. To take over the business of a motor engineer and garage proprietor carried on by Mr. F. Groome at Whalley, and to adopt an agreement between the said Mr. F. Groome and Mr. J. Simpson. Registered office, King Street, Whalley, Lancs.

DELAHAYE AND CO.—Capital, £165,000. To acquire the business of the Societe des Automobiles Delahaye carried on by Messrs. Leon Desmarais et Morane at 10, Rue du Banquier, Paris, and elsewhere. Registered office, 18, St. Helens Place, E.C.

SMALLWOOD'S MOTOR AND CYCLE COMPANY, LTD.—Capital, £7,000. To acquire the business carried on at 52, Corporation Road, Middlesbrough, and 13, Queen Street, Redcar, as Mr. J. Smallwood. Registered office, 52, Corporation Road, Middlesbrough.

BEESTON ACCUMULATOR SYNDICATE, LTD.—Capital £500. To adopt an agreement with Messrs. S. Halford and E. Shoals, and to carry on the business of electric storage battery or accumulator manufacturers, chargers of accumulators, electric engineers, motor and car makers, etc. Registered office, Post Office Square, Beeston, Notts.

IMPROVED MOTOR OMNIBUS COMPANY, LTD.—Capital, £100. Objects as indicated by the title. Registered office, 78, Hamilton House, Bishopsgate-street Without, E.C.

WHITWORTH VALE MOTOR OMNIBUS COMPANY, LTD.—Capital, £10,000. Objects: To carry on the business of motor-car and omnibus proprietors, carriers of passengers and goods, &c. Registered office, 446 Market Street, Whitworth, Lancs.

HALLEY'S INDUSTRIAL MOTORS, LTD., has been registered with a capital of £75,000 in £1 shares, of which 37,500 have just been offered for public subscription. The Glasgow Motor Lorry Company has been acquired in the purchase, and the services of Mr. G. H. Halley have been secured for seven years.

## THE CLEANLINESS OF NUMBER PLATES.

THE Motor Union successfully appealed before the Hertfordshire Quarter Sessions against the decision of the Stevenage Magistrates in convicting Valentine Hall, motor-car driver to Mr. C. D. Rose, M.P., for allowing his number plates to be rendered not easily distinguishable. The evidence for the prosecution was that the defendant went through Stevenage in a motor-car. He was stopped by a constable, who alleged that he was unable to distinguish the numbers either on the front or back number plates, because they were covered with mud. The defendant insisted on the constable taking him to the police station, where they saw the sergeant. After hearing evidence counsel for the appellant contended that the evidence of the sergeant and the constable was conflicting, and that the defendant had taken all steps reasonably practicable to prevent the plates becoming not easily distinguishable. It could not be said to be "reasonably practicable" to compel a motorist to get off dur-

ing such a short journey, thirty miles, to see whether his front and rear plates had been in any way splashed with mud, as they doubtless would be on a wet day. The Court allowed the appeal with costs.

### ROAD REPORTS.

**WALES.**—The instructions of the Roads Improvement Association, printed in Welsh, have been distributed among the workmen engaged by the Rhondda and Mountain Ash Urban Councils.

**CHESHIRE.**—The roads of several villages in Cheshire have lately been treated to a new dust-laying preparation introduced by Emulsifix Ltd., 6, South Street, Manchester. We shall be pleased to have the impressions of motorists as to its efficacy.

**DUNTON GREEN.**—The road through Dunton Green (Kent) is to be tarred at a cost of £60, half of which will be contributed by the Kent County Council, and the other moiety jointly by the A.C.G.B.I. and Motor Union and the parishioners of Otford.

**HILLINGDEN HEATH.**—The Middlesex County Council has tarred the road at Hillingden Heath, to the advantage of the residents in the locality.

**HEREFORD.**—Mr. Parker, the city surveyor of Hereford, is endeavouring to discover a means of abating the dust nuisance which shall be both effectual and cheap. In his experiments tar has played a most important part. He puts the cost of his latest efforts at one-third of a penny per yard super, and he expects to save this by the diminished cost of watering and scavenging by the end of the year.

**VALE OF TILBERTHWAIT.**—Dismay has been caused in and about the romantic Vale of Tilberthwaite, near Coniston, by the posting of a notification that certain roads in the locality are now closed to the public. These are in connection with some slate quarries and are really private, but, being much superior to the old township roads, the public use of them has been permitted for some years. Meanwhile the old public roads have been neglected and have become almost impassable, so that if the private roads are closed several small hamlets and remote cottages will be almost isolated. There is a disagreement between the quarry owners and the road authority—the Rural District Council of Ulverston—the former considering that the portions of the roads the public have used are not properly maintained. They have decided to close them by way of protest.

**STOCKTON.**—The road surveyor, Mr. W. Burton, to the Stockton Rural Council has been advised by some members of that body to use a stronger dressing of whinstone chips instead of road scrapings in that locality, but he is against the suggestion, because the fine whinstone dust floats in the air, and the whole matter is really one for national consideration.

**COWBRIDGE.**—A portion of the main street of Cowbridge has been treated with tar by the Town Council, who are fully prepared to similarly treat the whole of the streets of the town should the experiment prove a success.

### PUBLIC MOTOR SERVICES.

**KINGSTON.**—The New London and Suburban Omnibus Company have replaced their service of horse vehicles plying between Kingston and Richmond with motor-omnibuses.

At the Eggescliffe Parish Council, Mr. Lawrenson moved a resolution in favour of inviting the Stockton and Middlesbrough Tramway Company to consider the desirability of running motor-buses between Yarm and Stockton. The resolution was passed with only two dissentients.

**SOUTH COAST.**—On Monday an hourly service of motor-buses was commenced by the Brighton, Hove, and Preston United Omnibus Company, Ltd., between Kemp Town and Worthing.

**LICENSES** have been granted at Worthing for thirteen motor-omnibuses to ply for hire through the town.

The Police Committee of the London Court of Common Council is considering the question of the dropping of lubricating oil by motor-buses passing the City. The Kensington and Marylebone borough councils are also considering the "noise, vibration and smell of the motor-buses passing through their areas." Petitions on the subject are also being prepared by the executive of the "Quieter London Movement."

### MOTOR-CAR ACCIDENTS.

A SERIOUS motor-car accident has occurred in Junction Road, Ewhurst, Sussex, eight miles from Hastings. A car belonging to Messrs. Skinner, of Hastings, containing nine passengers, was overturned at Cripps Corner. The matron of Buchanan Hospital, Hastings, was killed, and four others were seriously injured.

At the cross roads near Berwick, about eight miles from Eastbourne, a serious motor-car accident has occurred to Mr. Freeman-Thomas, the Liberal candidate for South-East Cornwall. He was proceeding home to Ratton, near Eastbourne, in his car, when coming along the road from Alfriston towards Berwick Station was another car with Major Edwards. The owner of this automobile is Mr. Cohn, of Alfriston, and a son-in-law of Mr. Horatio Bottomley, M.P. Unhappily the two cars, which were travelling in opposite directions, attempted to pass the cross-roads at the same moment, with the result that a violent collision occurred. The vehicle containing Major Edwards

was struck with such force as to throw it in the air and turn it completely over. Mr. Freeman-Thomas was also thrown from his car, and his face and head came into contact with the ground, causing severe bruises and slight concussion of the spine. Fortunately another motor-car drove up a few minutes later and Mr. Freeman-Thomas was conveyed to his residence. Major Edwards also had serious injuries and has been staying at Alfriston. Both the chauffeurs escaped without material injury, although each was thrown from his car.

A FATAL accident occurred at Plymouth on Saturday, a child being killed by a motor-car, the property of Lieutenant R. W. Cory, Royal Artillery. Lieutenant Cory, with Lieutenant Patrick R. Cohen, R.N., were being driven along Embankment Road, when two children ran in front of the car. Rose Emily Giles, aged five years, was struck on the head by one of the motor lamps and killed on the spot.

A CHILD named Louisa Brown was on Sunday morning knocked down by a motor-car as she was crossing Queen's Road, Wandsworth Road, (S.W.), after coming out of the Wesleyan Chapel close by. The child was picked up unconscious and conveyed to St. Thomas's Hospital, where she died on Sunday night from a fractured skull.

As a motor-car driven by Mr. Harry Turner, of Scholes, Cleckheaton, was passing through Wyke, near Bradford, a dog got in the way and became entangled with the steering gear, causing it to swerve. In its course the car knocked down Adam Crabtree and Richard Bishop. One man sustained severe concussion of the brain and other injuries, and is in a serious condition at home, whilst the other was removed to the infirmary, having dislocated his right shoulder and sustained bruises on the body.

The Aston Hill Climb.—Mr. E. M. C. Instone on the 35-h.p. Daimler on which he made the fastest time.

### APPEAL DISMISSED.

At the Winchester City Quarter Sessions the Recorder has heard the appeal of William R. Rivers, chauffeur to Sir George Cooper, of Hurley Park, against a conviction by the city justices for having, on April 14th, driven a motor-car in Upper Brook Street at a speed dangerous to the public, having regard to the circumstances of the case, in consequence of which the Bench fined him £2 and £2 16s. costs. For the appellant, Mr. J. A. Simon, M.P., contended that it was a physical impossibility for the car to have been travelling at the pace alleged. He pointed out discrepancies in the evidence given by witnesses before the Bench and at that court, and mentioned a difference of opinion among the magistrates below in arriving at a decision. The appellant stated that when turning the corner, at about six miles an hour, he saw a wagonette twelve yards away on the wrong side of the road. He immediately put on the brake, but, seeing the horse so near him, he took it off again, and tried to go across the road. Expert evidence was to the effect that the car, with its defective pump, could not go more than four miles an hour, and the Recorder, in giving judgment, said if the car had been stopped instantly the collision would not have occurred. He had the driver's statement that the brake would not act, and there was ample evidence that the driver drove the car at an unreasonable speed, and therefore the appeal would be dismissed with costs.

### MOTOR-CAR OUTING FOR CHILDREN.

MR. CHARLES SMITH, the hon. secretary of the North London A.C., is arranging a motor-car outing on the 19th inst. for the Fresh Air Fund for children. He invites motorists who will be kind enough to lend their cars for the purpose of giving the poor children a few happy hours to communicate with him at Avondale, Brownlow Road, New Southgate, N. The start will take place at 2 p.m. from the Shaftesbury Retreat, Loughton, Essex.

## CASES AGAINST MOTORISTS.

*[It must be understood that it would be impossible to report all the cases that are heard every week; we therefore endeavour to give only those which involve points of particular legal importance or of public interest.]*

AT the Marlborough Street, London, Police Court, Mr. Plowden dismissed a summons against Mr. Aristide Bleiner for driving a motor-car in a manner which was dangerous to the public, in Piccadilly Circus, on the 11th ult. Two policemen who were directing the traffic at the corners of Regent Street and Shaftesbury Avenue stated that the defendant coming down Regent Street passed on the right of the two islands near the fountain in Piccadilly Circus, and that there was a lot of traffic about at the time. After hearing the defendant, Mr. Plowden, the magistrate, stated that there had been a mistake somewhere, and as the police constables were thirty or fifty yards away respectively from the first island, he felt bound to accept the testimony of the defence, and that if it were not possible for the driver to follow the flow of traffic, and as he was placed in the position in which he was by the other traffic, he was at liberty to pass in the way he did, and that he did not see where the danger was, the summons would be dismissed. There was an attempt at applause at this decision, but was stopped by Mr. Plowden with a wave of the hand.

AT Stirling, Francis Davis, motor-car driver, has been found guilty of not stopping his car on Gargunnoch Road when signalled to do so by the driver of a horse and trap, and fined 20s. The owner of the car stated that the horse and man were playing the fool, and farmers held up their hands for motorists to stop when not required.

AT Middlewich, Douglas Gilmore, of Dorking, was summoned for failing to produce his licence when requested. A constable stated that the defendant drove a motor-cycle at an excessive speed near Middlewich on June 6, and only after half an hour's argument would he produce the licence. He was fined 40s. and costs, and his licence was suspended for a month.

Two months' imprisonment in the second division for manslaughter has been given to Albert Edward Carter, a chauffeur, at Hertford Assizes. While driving a motor-car through Markyate, near Dunstable, on April 30th, the prisoner ran into a horse and cart coming from a side road. Mr. Preston, an occupant of the motor-car, was thrown out and killed. The driver of the cart was so badly injured that he could not appear at the trial of the motor-car driver. Mr. Justice Ridley, in passing sentence, said the public must be protected, and a warning was necessary to motor drivers.

AT Steyning Petty Sessions, Alfred H. Cooling, chauffeur, was fined £10 and costs, £14 9s. 6d. in all, for driving a motor-car at a dangerous rate of speed between Brighton and Shoreham. Two other chauffeurs were similarly summoned, but failed to appear, and warrants were ordered to be issued.

MR. LOUIS SINCLAIR, ex-M.P., was summoned at Bow Street (London) Police Court on Monday for driving a motor-car in a manner dangerous to the public. The police evidence was that the defendant went on the wrong side of the refuge in driving from Holborn into Chancery Lane at a pace of eight miles an hour. Defendant, giving evidence on his own behalf, admitted that he drove on the wrong side of the refuge, but said he understood the motions of a constable to indicate that he might do so. Defendant was fined 40s. and 23s. costs.

IT was alleged at North London that George F. Carpenter, chauffeur to Mr. Arthur Roberts, had driven a motor-car along Balls Pond Road while intoxicated, and had knocked an old man down. Carpenter pleaded guilty. He had some trouble with the car, he said, and had a drink with two men who helped him. The magistrate remarked that it was bad enough for a man to get drunk when driving a horse, but motor-cars were a danger even in the hands of a sober man. One month, with hard labour.

AT High Wycombe, on Saturday, a prosecution was heard for excessive motoring through the main streets of that borough, the defendant being H. M. Grannett, of Nutford Place, Edgware Road, London. The speed given was equivalent to over twenty-eight miles an hour. Defendant said he drove the car for a doctor, and on the day in question there were fourteen gentlemen in the car. Fined £2 and 11s. costs. There have been no proceedings taken against motorists in the town for a considerable time, although Wycombe was one of the first places where action was taken to arrest the rapidity with which motorists travelled, the head constable in the first instance devising the plan of placing a scaffold-pole across the road to bring offenders to a standstill.

SOME heated passages-at-arms occurred at Guildford on Saturday, when a Maidenhead motorist was fined £10 for exceeding the legal limit, the police stating that he had covered one piece of road at the rate of sixty-nine miles an hour. The first instance occurred when the chairman (Sir Wm. Chance) suggested that the defendant should stand by the side of the dock. The solicitor for the defendant said this was quite unnecessary, and suggested he should leave the room. Then the solicitor went on to complain of the feeling against motorists, remarks denied by the chairman. After this the solicitor and chairman came into collision again, and finally the former, on a point of law, refused to show his client's licence.

FOUR cases of exceeding the legal limit on the Portsmouth Road have resulted in as many convictions.

AT the Lambeth Police Court, on Tuesday, three motorists were fined for driving at excessive speed.

## POLICE TRAPS.

POLICE traps are in operation between Hendon and Stanmore, Watford and King's Langley, Berkhamsted and Tring.

THERE is a measured furlong in the Clapham Road, S.W., which has lately produced several victims of police activity.

THE Southwick police trap is on the upper road to Shoreham not far from the cross roads.

TRAPPING is again proceeding merrily at Lancaster.

SO many complaints against the unfairness of the police trap at Todmills, near Carlisle, have recently been made that the magistrates resolved to make a personal inspection of the place.

TRAPS are fairly frequent on the Bodmin and Truro road as well as in several other Cornish districts, where police hostility seems to be conspicuous.

THERE is a trap on the Winchester-Basingstoke road, about a mile and a half before reaching the latter place.

MOTORISTS should be careful in the Newmarket district, where police activity against motorists has lately been pronounced.

SEVERAL motorists have been caught in the Southwick police trap.

THE Middlesbrough police are tracking motorists passing rapidly through the district by means of the telephone.

POLICE traps have been notified us in the Basingstoke district.

TRAPS are being frequently laid against motorists in the neighbourhood of Whitchurch. There is one between that town and Chester; another on the Whitchurch and Shrewsbury road, and a third between Nantwich and Acton.

## THE LIABILITY OF 'BUS DRIVERS.

FREDERICK JOHN MERRYWEATHER, of Upper Tooting, has been summoned by the Chelsea Borough Council, who sought to recover £4 17s. 1d., the amount of the damage to a lamp-post broken by him in the course of his employment as a motor-'bus driver at Fulham Road. It was stated that the defendant first collided with a van, and when getting clear of this he ran into a lamp-column, snapping it in two pieces. The defendant urged that the night was a bad one, and that he did not think he should pay. He had sent the bill to his employers. Mr. Curtis-Bennett said that all he could do was to make the order for the amount with 3s. costs.

## ALLEGED PERJURY BY A MOTOR-CYCLIST.

BEFORE Mr. Justice Lawrance, at the Essex Assizes at Chelmsford, Charles Edward Harris, road surveyor to the Essex County Council, and Stanley Church, house agent, of Purley, Surrey, surrendered to their bail on a charge of perjury. The case arose out of a summons which was issued against Mr. Harris for exceeding the speed limit with his motor-bicycle, to which was attached a trailer containing Mr. Church. The police had a motor trap in operation between Stansted and Cambridge, and on April 14th Mr. Harris was alleged to have passed the forty-second milestone, both in the morning and in the afternoon, going to and returning from Cambridge, and it was in respect of the afternoon that the alleged offence occurred. He was alleged to have passed the forty-second milestone at eleven o'clock in the morning. In the afternoon he passed again at 3.18, the thirty-sixth milestone being passed at 3.30, thus covering a distance of six miles in twelve minutes. Mr. Harris proved an alibi before the local magistrates, and the summons was dismissed, and the police, some weeks afterwards, charged him and Mr. Church with perjury. Both defendants maintained that they did not pass the spot mentioned until an hour and a half after the time alleged, both morning and afternoon. They said that they did not leave Stansted until between 12 and 1 o'clock, and that they did not leave Cambridge on the return journey until between 4 and 4.30, so that it was impossible for them to have passed the spot at the time alleged. Mr. Jones for the prosecution announced that there was a large number of witnesses prepared to support both sides, and in view of that he had talked the matter over with his learned friend, and they had decided to adopt the course that either one side or the other had made a mistake, which was recognised to be perfectly honest. Mr. Gill, K.C., for the defence, spoke to the same effect, and his Lordship having expressed concurrence with the course adopted, the jury found both defendants not guilty, and they were discharged.

## ASSAULT ON A MOTORIST.

MR. F. MOODY was driving in a motor-car to his home in West London, about midnight, on Monday, when in the Bethnal Green Road, E., his car was brought to a stop by the traffic. The application of the brakes caused the car to skid on the wet road towards a pony-cart in which Thomas Davidson was seated. The cart was not touched, but Davidson used abusive language towards the motorist and struck him a heavy blow on the jaw, knocking out one tooth and loosening three others. At the police-court, on Tuesday, Mr. Cluer said that a fine would not meet the justice of the case, and sentenced Davidson to fourteen days' hard labour. Notice of appeal was given and the defendant was released on bail.

# THE Motor-Car Journal.

VOL. VIII.]

LONDON, SATURDAY, JULY 14, 1906.

[No. 384.

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

## COMMENTS.

SOCIETY has become so enamoured of the motor-car that the Court dress-makers, florists and others who bask in the prosperity of Society's *grandes dames* have been left lamenting. Many causes have made the season of 1906 a lean one, and beyond the fluctuation to which all periods must be liable is the changing fashion that is coming over social affairs. The motor-car is said to have enormously reduced the number of dresses necessary in order to go through the London season. Ladies enjoying the delights of the open-air on the motor-car do not have the opportunity of changing their frocks half-a-dozen times a day, and the motoring costume, though smart in appearance, does not offer so much opportunity for elaboration and decorative effect as does ordinary attire. Of course the ladies' tailor has benefited by the changing conditions, for the well-cut gowns for motoring and other outdoor functions require attention at his hands. But the altered fashions of the time are apparent even in more substantial matters than attire, and the representative of a leading firm of West End house agents and furnishers, who, by the way, have lately inaugurated a system of warehousing motor-cars for private owners, declares that the motor-car is in part responsible for the decadence of the town mansion, particularly those houses which were once let at from 500 to 1,000 guineas for the season. The people who were in the habit of taking such mansions now go to an hotel, entertain lavishly for a few days, and then return by motor-car to the country. The railway company is also a loser in first-class fares.

### A Standard Touring Body.

WITHIN the last few days a conference of representative automobilists and carriage-builders has been held under the aegis of the A.C.G.B.I. and the Coach-makers' Society with a view to discussing the points of a standard body for motor-cars intended for touring purposes. Complaints have been rife for some time as to the difficulty of defining such a body, and unpleasantness has been aroused in connection with some competitions owing to the varying forms this has taken in cars described as intended for public sale. We await with some interest the publication of the Automobile Club's statement as to what constitutes a standard touring body, and it is hoped that this will be issued in time enough for makers to conform to it in building cars for the race in the Isle of Man.

### The Tourist Race.

MATTERS in connection with the race for the Tourist Trophy in the Isle of Man are now being locally considered, and in the Tynwald Court a resolution has just been passed to enable the event to be held in September. Members of the House of Keys expressed strong repugnance to motor-cars practising on Sundays, and threatened to move the house to retire unless given an opportunity to discuss the grievance. The governor (Lord Raglan) avoided this constitutional deadlock by assuring objectors that he would exercise his authority in pre-

venting Sunday practising, and the Automobile Club would support him. Entrants for the contest should bear this in mind when making their arrangements, and do all they can to respect the local sentiment with regard to Sunday observance.

### Drivers.

MR. PERCY RICHARDSON has a long and varied knowledge of motorism, and his conclusions on the driver question, as set forth in our correspondence columns this week, will be found in accord with the experience of all practical motorists. Undoubtedly the phenomenally rapid extension of the movement has had much to do with the shortage of competent men. Opportunities for acquiring sound theoretical knowledge are growing, as well as the chances of gaining workshop experience, but the difficulties of acquiring the necessary confidence on the road are not so easily got over. This is undoubtedly the weak spot in the present position, and Mr. Richardson's suggestion deserves the earnest consideration of the trade.

### Canada.

VARIOUS opinions are expressed by different people with regard to the condition of the roads in Canada; and while an Englishman has lately returned from the Dominion with a poor idea of their suitability for motoring, an American who knows them well declares they are not nearly so rugged as they are reported. The scenes on another page of some incidents during a tour in a part of Canada on a White car will be of general interest to those lacking opportunities of American travel, and who, from force of circumstances, have to be content with explorations of the old country, many parts of which have only been discovered since the revival of the motor.

### Balloon Racing.

BALLOON racing is a novelty in this country, and of unique interest both to participants and spectators. There is no one to keep the course clear; no crowd to cry "foul" should one balloon get across the path of another; and nothing of the excitement of numbers to those engaged in the race. And yet the sport is intensely exciting to those up in the clouds. On Saturday there was a balloon race from Ranelagh to Ingatestone, near Chelmsford, and seven balloonists took part in the adventure, these being:—(1) Aero Club III. (50,000 ft. capacity), Mr. C. F. Pollock; (2) Dolce far Niente (45,000 ft.), Mr. Frank H. Butler; (3) Zenith (42,000 ft.), Professor Huntington; (4) Carnation (35,000 ft.), Mr. Griffith Brewer; (5) Venus (42,000 ft.), Mr. Moore-Brabazon; (6) Midget (17,500 ft.), the Hon. C. S. Rolls; (7) Enchantress (50,000 ft.), Mr. Leslie Bucknall. A start was made about 4.30 p.m., from the Ranelagh Club grounds, and, although all the competitors kept within sight of one another throughout the journey, none was successful in actually reaching his destination. Professor Huntington, Mr. Griffith Brewer, Mr. Moore-Brabazon, and the Hon. C. S. Rolls all descended at Stanford-le-Hope, and Mr. Leslie Bucknall came down on an elm tree three miles from Grays. There were no accidents, though one balloon had a narrow escape of

being entangled in some telegraph wires. Mr. Frank Butler, who descended at Ossett, nine and a half miles from Ingatestone, was adjudged the winner, and gained the gold cup presented by the "Evening News." Mr. Pollock won the twenty-guinea cup presented by the Ranelagh Club.

### The Royal Commission.

At length the Royal Commission on Motor Cars have considered their report, which may be presented to the House of Lords within the next few days. In anticipation of this publication the Hon. A. Stanley will introduce a Bill to provide for the establishment of a Highway Commission for England and Wales, and for the amendment of the laws relating to highways and bridges. The main features of the proposal are the creation of a central department for the purpose of assisting the local highway authorities, the construction of new main roads through the large urban districts, and the amendment of the law relating to the maintenance of bridges. Among motoring members of Parliament the Bill evokes universal support, and it is hoped that some progress may be made with it during the autumn session.

Mrs. Adams at the wheel of the 10-h.p. Adams-Hewitt Car, which secured the First Prize for Smart Appearance on the occasion of the Ladies' Automobile Club Gymkhana at Ranelagh on the 30th ult.

### New Converts.

THE motor-car is converting the converted, and about the middle of next month the President of the Baptist Union intends motoring to the churches of his denomination—small as well as large—in the counties of Bedford, Cambridge, Northampton, and Oxford. This is the first campaign definitely organised, as a part of the presidential activities, by any of the denominational organisations, if we except General Booth from the category. Another accession to the ranks of motorists is that of the ladies who attained prominence owing to their anxiety to secure the vote for themselves and their sex. Some of these, too, are combining the pleasures of motoring with platform campaigns in and around London—their car, with its legend, having been a conspicuous feature of London traffic during the past few days.

### The Rule of the Road.

ACCORDING to a Manchester lawyer who appeared in a case at Blackburn last week, when a pedestrian sued the owner of a carriage by which he was knocked down as he stepped off the pavement to board a tramcar, there are three rules of the road. He set them forth as follows:—The first is that when you are driving and you meet a vehicle coming in the

opposite direction, you keep to the near side; the second is, that when you pass a vehicle going in the same direction you pass to the right; the third is the rule which has been suggested by some judges, and has certainly been acted upon by a great many motorists and cyclists, that in passing a tramcar you keep on the near instead of the off side. There is also the rule that foot-passengers passing one another on the road must keep to the right, but judges have repeatedly held that carriages could pass pedestrians on either side.

### Motor Car Imports and Exports.

THAT the shrinkage in the imports of foreign motor-cars into this country which occurred in May last was due to the labour troubles in France and Italy is indicated by the returns for June, which show that, the strikes ended, the trade has once more resumed its normal condition. During last month no less than 530 cars, valued at £239,592, were imported into this country; parts were responsible for a further sum of £149,395, giving a combined total of £388,987, which compares with only £312,721 in June, 1905. As regards the imports during the first half of the current year, these have amounted to 3,217 cars, worth £1,299,262, and parts to the extent of £1,020,829, the aggregate of £2,310,081 contrasting with only £1,764,924 in the first six months of last year, or an increase of roundly £545,000. Turning now to the exports of British motor-cars and parts, these, during June, amounted to £48,552, an increase of £18,000. For the first six months of 1906 the shipments comprised 499 cars, valued at £175,238, and parts estimated at £128,870, the total of £304,108 representing an increase of £139,938.

### Kindly Thought.

THE Huddersfield branch of the Yorkshire Automobile Club has initiated two or three useful and pleasant movements associated with motorism, and its motor trips for nurses and hospital patients was the forerunner of the Children's Day that has become a feature of many club programmes. On Saturday last the members took a hundred patients and nurses from the local infirmary for a trip to the moors. More than thirty cars were placed at the disposal of the committee, Mr. E. Gordon Learoyd, hon. secretary, making all the arrangements with a studied plan of detail that enabled everything to go smoothly and without mishap—as may be gleaned from the further reference in our Club News.

### Technical Instruction.

AN interesting conference has just taken place between the committee of the Irish Automobile Club and the directors of the Pembroke Technical School, Ringsend, Dublin. For some time past this school has been leading the way in Ireland so far as automobile instruction is concerned, and the idea of the conference was to suggest some means of bringing students who had obtained proficiency in driving into contact with those likely to require their services. Sir Horace Plunket, whose official encouragement has been a feature in the development of the school, pointed out that its needs in the present state of progress were different to what they would be in future years. His opinion was that it would be wise to obtain the loan of some vehicles for practice that were really fit for the scrap. In the end it was decided to have a further conference with a view to formulating some scheme of instruction likely to meet the needs of the time.

### An Irish Conference.

ANOTHER interesting assembly at which the Irish Automobile Club has figured was that held last week at Clara, King's County, whither Mr. Lewis Goodbody had invited a number of members of the King's, Queen's, and West Meath County Councils, to confer with motorists as to the means of attracting a more continuous flow of English tourists to the

**Emerald Isle.** The fact that the Irish Club was invited shows that those interested in the popularisation of the country recognise the value of the motorist as a "paying guest." Sir William Goff pointed out that the first thing to be done was the improvement of the roads, and eulogised the work that Mr. Arthur Hackett, county surveyor of Tipperary, had done in the district under his jurisdiction. Undoubtedly there is not the same interference with motorists on the part of the Irish police that we experience in this country, and motorists would be welcome indeed. Mr. E. White (honorary secretary to the Irish Club) joined with his chairman (Sir William Goff) in emphasizing the advantage of a good road service in Ireland; and we would suggest that this should be the first consideration in order to attract motoring visitors from this country.

#### The Automobile Association.

THE Automobile Association, whose membership has recently been making rapid strides, took an opportunity of inviting the Press on Sunday last to an ocular demonstration of the working of its system of cyclist scouts. The party assembled at the residence of Colonel Bosworth (the chairman of the Association), at Cedars Court, Roehampton, among the cars

Association and for their presence that day. After a short interval the visitors started on the run back to town, a large number breaking the journey near Banstead to take advantage of Mr. Walter Gibbon's kind invitation to afternoon tea at his pleasant residence at Burgh Heath. Altogether the run was a great success, the event going through without a hitch, thanks to the energies of the secretary, Mr. Stenson Cooke, from whom we learn that a considerable extension of the Association's operations is in contemplation.

#### On Holiday Bent.

NEVER before has the automobile made such a bold appearance at sportive events as has been the case this year. No race meeting is now properly equipped unless it has its motor garage, and the crowd of fashionable folks who motored to Ascot this year was proof of the popularity of the car. During Henley week a motor-bus was run by the Great Western Railway Co. between Marlow and Henley, with such good results that this will probably be developed into a regular service in future years. All round the coast interesting developments are proceeding. From Portsmouth and Southampton motor char-a-banc trips to the New Forest are now a feature of

[Moys, Putney.]

lined up to convey the guests of the day being Colonel Bosworth's 18-24-h.p. Clement, Mr. Walter Gibbon's 50-h.p. Itala, Mr. Charles Jarrott's 40-h.p. Crossley, Earl Russell's 30-h.p. Daimler and 18-h.p. White steamer, Mr. J. Schlentheim's 25-h.p. Winton, Mr. Charles Temperley's 24-h.p. Isotta-Fraschini, Mr. Staplee Firth's 16-h.p. Orleans, Mr. Wilfrid Firth's 15-h.p. Panhard, Mr. H. E. Taylor's 18-h.p. Rochet-Schneider, Mr. Jairus Witherowd's 14-h.p. Renault, Mr. A. H. Adams 10-h.p. Adams-Hewitt, Mr. R. Dennis's 24-h.p. Dennis, and Mr. C. H. Watson's 24-40-h.p. Fiat. After the inevitable photograph was taken a start was made about 11 a.m. for Brighton, via Sutton, Reigate, and Crawley. We occupied a seat on the Fiat, and, needless to say, the run down was made without any untoward incident, albeit the dust was anything but pleasant. Having had to make a detour round Croydon to pick up a passenger, we were among the last to arrive at the Hotel Metropole, where about seventy-members of the Association and their guests, including several ladies, sat down to a well-served lunch. Speech-making was restricted to a minimum, Colonel Bosworth simply thanking the members of the Press for the support they had given the

daily delight, and everything is being done to further the scheme for a motor service between Lynmouth and Dulverton, Lord Fortescue having definitely offered to give the land for a new road, avoiding the narrow and dangerous point known as Barton Steep. Motor-cars have been conspicuous among the vehicles visiting Bude and other Cornish resorts, while nearly every town facing the English Channel has its fleet of motor-cars—to say nothing of motor-buses plying for hire.

#### Uniformity in Lighting.

CONFUSION between the regulations of central and local authorities has not frequently arisen in connection with automobile matters, but it would appear that there is need of a current of common-sense being sent through the country so far as the lighting of motor-cars is concerned. At Longton a motorist has been summoned for non-compliance with the local bye-law with regard to lights on motor-cars. According to the requirements of the local Council, two lights were wanted on the vehicle, whereas the Act of Parliament under which motor-cars

have their legal status requires but one. Undoubtedly, it was the intention of the Legislature that there should be uniformity in this matter of lighting; such intention can, however, easily be frustrated if local authorities are allowed to over-ride this reasonable point. In the case which has occurred at Longton a fine has been inflicted; but the magistrate has stated a case, and we should like to see the Motor Union look into the question so that the interests of motorists may be fully safeguarded.

#### The Prevention of Dust.

THAT the gentlemen associated with the local authorities throughout the country are bringing their expert knowledge to bear on the subject of the prevention of dust is one of the most satisfactory features of a somewhat clouded problem, and we are always pleased to hear from readers in districts where the difficulties of the situation have been assuaged either wholly or in part. During the early part of last year Mr. W. H. Maxwell, the borough surveyor of Tunbridge Wells, carried out some useful practical tests in the use of tar, treating about 10,000 square yards of main road surface with the liquid, which is the residue of oils used in the manufacture of the carburetted water gas as distinct from oil gas tar. The surface of the roadway was well swept and the liquid prepared on the site then applied in a hot state by means of hand water carts with coarse hose or spreader. It was then brushed into the surface with stiff-haired tar brushes, the process being repeated until the pores of the surface were well filled and an asphalt-like appearance was presented. Experience has proved the economy of application, and the good condition of the road thus prepared after many months' hard wear. Comparative tests with other materials have been made, but the enterprise of Mr. Maxwell in connection with this gas tar has amply justified his advocacy of the preparation to his local council.

#### Railway Rates.

A CORRESPONDENCE is now proceeding between the officials of the Railway Clearing House and the Engineering Section of the Manchester Chamber of Commerce with regard to the carriage of motor-cars to exhibitions—a matter of considerable moment to those interested in these essential means of publicity. At present it is the custom of the railway companies to allow motor-cars intended for display at exhibitions to be carried only one way at half the ordinary rates. This concession is of real advantage to the railway companies, for if the exhibition of the car is successful many others may be forwarded in the ordinary course of business. Another point upon which negotiations are proceeding is the rating of the "chassis," and the point as to its inclusion in the classification as machinery or as a finished car is of still wider interest. Here, again, the railway companies should recognise the likelihood of this traffic growing to important dimensions, and the wisdom of carrying it on reasonable terms, rather than force those engaged in the industry to take to the road.

#### For Old Soldiers.

MILITARY service has hitherto been regarded as a scarcely suitable training for the avocations of the civilian life into which the rank-and-file of the Army is thrown upon the completion of the years of engagement. But, now that the responsible authorities are endeavouring to devise a scheme for the preparation of soldiers on their return from the barracks to the home, it is expected that attention will be given to the utility of training them as motor-car and bus drivers. At Portsmouth something has already been done, and the experience there gained, together with the practical knowledge of men like Colonel Holden and Major Lloyd, should materially assist Mr. Haldane in encouraging men who show an aptitude for the work to become efficient drivers. There is likely to be a difficulty for some time to come in finding really suitable men for the public motor services which are being established in every direction. Time-expired soldiers

with a sense of discipline, a knowledge of motoring, and some experience with traffic, should be admirably adapted to the work.

#### The Police.

GRAVE disappointment exists in some of the home counties, notably Surrey and Hampshire, with regard to the neglect of the police to adequately patrol the districts, with the result that crimes against property and persons have lately grown in violence and number. These are the localities where police traps have been most prominent features of the landscape for some time, and where the officers of the law have most neglected their duties in looking after evil doers. Their activity in pursuing motorists has been most marked, in contradistinction to their neglect of the duties which were usually associated with the police. Policemen have been withdrawn from their legitimate work in order to watch the roads where honest men travel; meanwhile the criminal classes have been playing fast and loose with public and private interests.

#### A Surveyor's View.

SOME surprise will doubtless be expressed at the report of Mr. P. J. Sheldon, the county surveyor of Essex, to his Council on the result of experiments conducted by him on the old Roman road to Colchester, with the object of minimising the dust raised by motor-cars. Lengths of road were coated with tar at a cost of about £60 per mile, and this had proved efficacious. A drawback to the plan, however, was the difficulty of executing the work, the process being naturally a slow one, and as traffic could not be allowed over the tarred portions for a few days only one-half of a road can be done at a time. Mr. Sheldon, summing up, stated that the ultimate solution of the dust problem would lie rather in the improved construction of motor-cars and insistence on a moderate speed limit in urban and village areas, rather than in any radical change in the construction of roads. This latter conclusion cannot be put down to prejudice, coming, as it does, from one of the first officers of local authorities to adopt the motor-car in his work; but it is in opposition to the views of other competent surveyors.

THE Singer tri-car which Miss Muriel Hind drove in the Auto-Cycle Club's recent End-to-End run was fitted with a 9-h.p. engine.

"CARBURINE" motor spirit was used by Mr. J. B. Dunlop and Mr. S. T. Robinson, the winners of both the cups in the recent Irish Reliability Trials, and by Mr. McTaggart in his Irish End-to-End run, in which he beat the record with the Argyll car.

AN automobile cam shaft milling machine is one of the latest productions of Messrs. Webster and Bennett, Ltd., Coventry. It is a considerable improvement on the older type of machine, being more rigidly and substantially built, as well as having an increased speed from the point of view of output. For example, a cam shaft with eight average cams can be turned out from the solid in, approximately, one hour.

THE Middleton Pneumatic Hub Syndicate, Ltd., inform us that they have entered into an arrangement with the St. Helens Cable and Rubber Company, Ltd., for them to be the sole manufacturers of the pneumatic hub and to handle the wholesale trade. The retail trade will still be dealt with by the Middleton Syndicate. Considerable improvement has, we understand, recently been effected in the hub, rendering it both much more resilient and reducing the weight.

THE splendid performance of the 9-10-h.p. Swift car in the Scottish Reliability Trials is rapidly filling the works with orders. It was rather unfortunate that, owing to some minutes' stop for tyre trouble, the car had to take one hill much later than its proper time, and the wheels of the little car sunk in so badly at one point, where the road had been much cut up, that it caused just a momentary stop, the only mechanical stop throughout the whole trial.

## PRESSURE OR GRAVITY FEED FOR CARBURETTORS?

HERE are only four points that can be considered to have any reasonable weight in answering this question, and these are the following: 1, safety; 2, efficiency; 3, convenience; 4, cost.

1. *Safety*.—In order to cogitate this phase of the subject, we must analyse the matter by seeing what dangers are common to both, and in what manner one system may be immune from risks to which the other is liable. In connection with this, I have deemed it advisable to write to the very people who have this question most closely allied with their pecuniary interests; I allude to the insurance companies who take the risks in insuring motor vehicles of all kinds against fire. Their verdict is unanimous in considering pressure as being more open to danger than gravity. The letters before me are from the consulting engineers to the leading companies who undertake to insure motor-cars against being burnt, and the gist of their remarks is as follows:—"The pressure system is the more dangerous, if for no other reason than that if a pipe breaks or a connection gives way on the petrol side, the petrol issues with great force, and is generally propelled over a greater area than would be the case with the gravity feed. It must be conceded, we think, that greater pressures are used in the pressure system than are needed. Obviously, if no greater pressure were used than is actually necessary to do the work, then (as generally fitted to modern vehicles) there would be little to choose between the two systems." "My experience is that there is more risk in insuring a car when the petrol tank is under pressure from the exhaust than when the carburettor is merely fed by gravity. I consider that it would greatly minimise the risk if a tap were fitted on the supply pipe, between the tank and the carburettor, when the former is under pressure. Of course, I am aware that there are usually two taps to let the pressure escape when necessary, but when a fire breaks out on a car and the pressure is allowed to escape through one of these taps, more damage would most likely occur." Personally, I have not found this to be the case, having released the pressure and saved a blaze on several occasions.

The Chief Officer of the London Fire Brigade writes, *re* pressure feed:—"It was in vogue with the appliances that are fitted for burning oil fuel in connection with the paraffin tanks, but it was found most unsatisfactory on account of leakage." There is no doubt in my mind that, ignoring every other question but safety, the verdict must be given in favour of gravity, for the following reasons:—Suppose two tanks are full on two cars—one for pressure and the other for gravity feed—and that there is no pressure yet pumped in, nor any of the additional pipes and apparatus connected with same yet fitted. The conditions are then equal as regards safety; but, whereas the gravity tank is ready for work, the other one has to wait for supplementary fittings—copper pipes, taps, regulating pressure valve, pump, and pressure—before it can start work; and here, whilst we have not reduced any elements of danger, we have, on the other hand, added some. It is also open to question if a tank slung under the chassis is in as safe a position against accidental or malicious injury as it is if entirely protected by being enclosed in the body of the car under the seats.

The following point may, on the other hand, be urged in favour of pressure: the tank can be placed at the most remote point from where a fire is likely to originate, and from its most probable cause—flooding of carburettor; and, further, that, provided the pressure release tap is accessible, or the air pipe can be severed, or a hole punched in the top of the tank, the danger when a fire occurs can be averted. Whereas in a gravity tank, unless there is a tap conveniently at hand to be turned off, or someone with sufficient presence of mind to hammer the copper pipe flat, the flow of petrol must continue. Should the tank itself leak, the position of the pressure-fed one is safer, because it leaks straight on to the ground, whereas the gravity tank may leak a great deal and saturate some woodwork before it is discovered.

*Efficiency*.—Here we have to consider the duty of a tank, and in this case it is plainly to provide a smaller tank, commonly known as a float chamber, with a continual supply of petrol at a constant pressure. This is where those in favour of pressure feed claim the advantage. Neither the gravity nor pressure system is, however, perfect, for this reason, that in a pressure tank we have, we will assume, a constant pressure; but the weight of the liquid, roughly  $\frac{1}{2}$  lb. per square inch for each 12 inches in height, continually varies. The same applies to gravity tanks, except that the constant factor here is atmospheric pressure only. The least likely to vary is the gravity tank, because atmospheric pressure varies to a lesser degree than the artificial pressure of the fluctuating exhaust. The regulating valves are too much of a drawback occasionally, in pressure feed, to make it worth suggesting an automatic compensation for variations in height of liquid in tank. A pressure of 2 lb. per square inch should be ample to keep up a constant feed to the carburettor, but the gluey deposit round the blow-off valves, and the crass ignoramuses who delight in screwing them down hard, often treble the pressure indicated. Seeing that carburettors are adjusted and tested in the works by a certain determined pressure, it follows.

Mr. W. Thomas, of Llanelli, at the wheel of his 8-10-h.p. car, which successfully ran in the 110-mile Non-Stop Run from Swansea to Tenby and back, organised last week by the Welsh Automobile Club. It will be seen from the illustration that the ordinary tyres were taken off and in their place four Stepney Spare Wheels were fitted, on which the 110-mile Non-Stop Run was made, without any adjustment whatever.

that variations caused by different pressures altogether upset the calculations, with the result that over rich mixtures are supplied to the engines, and the petrol bills are augmented in proportion.

Apart from the variation in pressure, efficiency is dependent on reliability, and here undoubtedly gravity scores. Gravity is a law of nature, pressure by exhaust gases is a concoction of man. Unless a pipe is choked, which is a contingency open equally to both systems, gravity is absolutely certain. But pressure!

*Convenience*.—This point is open to argument. Pressure tanks slung under the frame render a chassis a complete unit, and bodies can be slipped on and off without disturbing pipes and tanks, and also for filling purposes the situation is convenient. To set against this we have the fact that gravity starts without pumping up, and the filler does not require unscrewing with a long spanner and doing up with the same each time.

As regards cost, the pressure system is slightly more expensive.

A. E. S. C.

## CONTINENTAL NOTES.

## La Coupe du "Matin."

The rules of the automobile tour of France, promoted by "Le Matin," of Paris, have now been issued. The event, which will start on August 2nd next, will comprise a run of 3,750 miles, divided into daily stages of about 187½ miles. Altogether three classes will be arranged as follows:—(1) Wheels; (2) Fuel consumption; (3) Endurance. The first class is sub-divided

Mr. C. A. Cooke, of Abingdon Court, Kensington, at the wheel of his 16-22-h.p. Isotta-Fraschini Car.

into three categories—ordinary tyres, anti-skid bands, and spring wheels. Different size tyres will be allowed for cars of varying weight and power, and points awarded for the longest distances run without punctures and for the condition of the tyres at the end of the journey. For the fuel consumption section the competing cars will be classed according to their bore and stroke and total weight, and the winning list drawn up on the basis of petrol consumed per kilometre ton. The endurance class is divided into six classes, beginning with motor-cycles, and including tri-cars, small single-cylinder cars up to 110 mm. bore; two-cylinder cars up to 120 mm. bore, or four-cylinder up to 85 mm. bore; four-cylinder cars up to 105 mm. bore; and four-cylinder cars up to 140 mm. bore. The classification will be based on regularity and endurance, an average speed of 25 kilometres per hour being demanded of the first three classes, 30 kilos. for the fourth, 35 kilos. for the fifth, and 40 kilos. for the sixth. No itinerary is being published, the subsequent day's run only being made known to the competitors on the previous evening. Full particulars of the competition can be obtained from Le Commissaire General de la Coupe du "Matin," Paris.

## The Circuit des Ardennes.

Now that the Grand Prix is an event of the past, interest in Continental motoring circles is being centred on the Circuit des Ardennes, which is to be held on August 13th. The contest promises to be an exciting one, as, with the exception of the Renaults, all the big racing cars have been entered. Included in the list to date are four Panhards, three Darracqs, three Gregoires, four Mercedes, three De Dietrichs, a Gobron, a Corre, three Clement-Bayards, and four Brasiers. The race will comprise seven rounds of the Ardennes circuit, the total distance being about 375 miles.

## The French Touring Club.

On Sunday last the road between Paris and Versailles swarmed with traffic of all kinds, from the latest motor-bus down to the humble bicycle, all making their way to the famous Palace, where a monster demonstration was held to celebrate the 100,000th membership of the Touring Club de France. After a banquet there was a balloon chase, while, finally, as a special favour, the fountains played for the benefit of the visitors.

## The International Motor-Cycle Cup Race.

The annual contest for the International Motor-cycle Cup was held in South Bohemia on Sunday last, over a triangular course which took in the little towns and villages of Patzau, Cetoras, Kamen, Rothrecitz, and Horepnik. Some doubt exists as to the exact length of the circuit, one authority giving it as 62.4 kilometres, and another as 67.4 kilometres. As four laps had to be made, the total distance was thus either 156½ or 168½ miles. The route was an extremely hilly one, comprising a number of bad turns and dangerous descents. There were altogether ten competitors, as follows:—

Country.	Rider.	Machine.
Austria—Obruba	Vecka	Puch.
	Nikodem	Puch.
	Taveneaux	Gillet.
France—Taveneaux	Fauvet	Gillet.
	Lalanne	Gillet.
	C. R. Collier	7-h.p. Matchless.
England—C. R. Collier	H. A. Collier	7-h.p. Matchless.
	C. B. Franklin	7-h.p. J.A.P.
	Kirchheim	Progress.

The start took place at Smircky, near Patzau, at 10 a.m., in fine weather. Of the ten starters four retired in the first lap, these including Franklin, whose engine was damaged, and the three Frenchmen, one of whom, Lalanne, sustained a broken knee-cap. In the second circuit C. R. Collier was put out of the running with a damaged motor, while in the third round Vecka fell and broke his leg. The result of the race was as follows:—

Rider.	Machine.	Country.	Time.
			H. M. S.
Nikodem	Puch	Austria	3 13 45
Obruba	Puch	Austria	3 29 41
H. A. Collier	Matchless	England	3 39 53
Kirchheim	Progress	Germany	3 55 21

Nikodem on the Puch Machine on which he won the International Motor Cycle Cup Race.

## Miscellaneous Items.

It is proposed to organise a reliability trial in Italy, entries for which will be reserved entirely for actual owners of cars, the trade being rigidly excluded.—Motor-buses are about to be introduced into Madrid.—The Touring Club Italiano of Milan has just issued the 1906 edition of its Handbook—a work that is almost indispensable to tourists in Italy.—Motor cycle carriers are about to be adopted by the postal authorities at Prague, Bohemia, for the collection of the mails.

## A TOUR IN CANADA.

ON Thursday the contest for the Glidden trophy commenced under the auspices of the American Automobile Association, whose annual tour has become one of the most popular events in the automobile world on the other side of the Atlantic. From Buffalo to Schenectady the route is practically the same as that traversed in the opposite direction by the St. Louis tourists in 1904. From Schenectady the motorists proceed by the most direct route to Saratoga, where the most interesting part of the tour commences.

Judge James B. Dill and Augustus Post, a sub-committee of the American Association's touring committee, recently completed a survey of the route from Saratoga to Bretton Woods in their White steam cars, attending to the thousand and one arrangements necessary for the comfort of the participants in the tour. From Saratoga the route lies *via* Glen's Falls,

the prevailing language. From Rouse's Point the road follows the west bank of the Richelieu River. At St. John commences the Chambly Canal, which the tourists will follow almost into Chambly. From Chambly the road bends westward to Longueuil, from which place the tourists will cross into Montreal either by ferry or by the great Victoria Bridge. There is an automobile club in Montreal and a Nelson monument. From Montreal to Quebec is a two-day trip, the road closely following the north bank of the St. Lawrence River. A night stop will be made at Three Rivers, half way between the two cities, and a vessel will be anchored to the quay in front of the Du Fresne Hotel to act as a floating hotel to supplement the somewhat limited accommodations on shore. While most of the road along the St. Lawrence is comparatively level, there are a few hills to be climbed when near Quebec, as the country there becomes somewhat more rugged. The last fifteen miles into Quebec is over a fine macadam road, and the tourists may see

Narrow Gauge Railway at Rangeley.  
The Richelieu River and Chambly Canal.

Nelson's Monument at Montreal.  
Monument Marking the Boundary between the United States and Canada.

## A WHITE STEAM CAR IN CANADA.

Warrensburg and Chestertown, following the Schroon Lake and Schroon River to Underwood, in the heart of the Adirondack Mountains, where the rugged peaks tower thousands of feet on either side. After a few miles in the mountains the tourists will reach Elizabethtown, which is seven miles from the railroad. There is a fine state road connecting the night's stopping place with the railroad station, and arrangements have been made for an automobile service connecting with the railroad at intervals of half an hour.

Thirty-five miles from Elizabethtown is the town of Champlain, where the road turns west to Rouse's Point, located a mile from the boundary line. At Rouse's Point it will be necessary to go through a few formalities necessary to entering Canada, the boundary monument between the Dominion and the States being shown in one of the accompanying photographs. As soon as the tourists cross the boundary line into the Province of Quebec they will find themselves in a country where French is

from the road the Plains of Abraham and the monument which marks the spot where General Wolfe died.

From Quebec the route leads toward home, the road being first to Rangeley, where its narrow gauge railway will be an object of interest. When the tourists leave Quebec they will cross over by ferry to Levis and then proceed over the old frontier road by way of St. Henri to the Chaudiere Valley. The road leads along the Chaudiere River through numerous quaint villages to the Jersey post office. From this point there is a climb over the "divide" which separates the waters flowing into the St. Lawrence River from those flowing into the Atlantic Ocean. The summit of the "divide" forms the boundary line between the Province of Quebec and the State of Maine, and the tourists will cross into the United States in front of the Line House, part of which is in one country and part in another.

The last day's run is through the woods by way of Phillips to Dixfield, making a total distance of 1,106 miles.

## THE ROBIN-JANVIER SIX-WHEEL MOTOR-VEHICLE.

AT the Paris motor-car exhibition three years ago much attention was attracted by the model of a six-wheel car exhibited by M. V. Janvier, of Rue d'Alesia, Paris, and made under the Robin-Janvier patents. Since that time the system has been developed into a practical form, and at the last Salon a 5-7 ton six-wheel lorry was exhibited. A brief refer

depends, of course on the balanced arms  $B^1, B^2$ , and on the total length of the latter, the outer ends of which are anchored in the longitudinal channel bars  $L_1, L'_1, L_2, L'_2$ , to which the axles are connected through special universally-jointed arms  $M_1, M'_1, M_2, M'_2$ . These connections form one of the special features of the arrangement, as they enable the two axles to be maintained equi-distant in the direction of travel, and at the same time render them absolutely independent of each other as regards any transverse or vertical displacement when passing over bumpy

Figs. 1 and 2.—Side and Front Elevation of Robin-Janvier Fore Carriage.

ence was made to the machine in our report of the show, but as the general design differs so greatly from the usual lines of industrial motor-vehicles, the more complete description we are now able to publish will no doubt prove of interest.

As will be seen from the illustrations, the front part of the car, in which the engine is located, instead of being supported, as usual, on a single pair of wheels, is carried on what is practically a four-wheel bogey, details of which are given in Figs. 1 and 2. From an examination of the latter it will be seen that the steering spindle of each wheel is connected to an articulated steering gear in such a way that when deflected they each take the necessary angle for the curve which it is intended to make in turning the car, rendering the steering very easy either in a backward or forward direction. Not only so, but the connections are also such that each wheel is free to mount an obstacle without affecting the others or lifting the body of the car.

roads, all lateral destructive shocks on the axles and abnormal torsion on the suspension springs being, it is claimed, in this way avoided. This result is achieved by reason of the fact that the raising of any one of the road wheels of the bogey only lifts the corresponding end of the spindle A 50 per cent. of the distance, while the movement on the central line of the chassis at its intersection with the centre of the spindle is reduced to 25 per cent. Furthermore, should both axles be raised from the ground an equal distance, only half the movement is transmitted to the spindle or to the chassis, a result which M. Janvier informs us enables them to successfully run the lorry on iron or rubber tyres with less shock to the machinery than is experienced in four-wheel wagons fitted with solid rubber tyres. Apart from the freedom from damaging shocks and the easy steering, M. Janvier also claims that the arrangement prevents skidding, and allows of corners being taken at a fair speed without danger,

Fig. 3.—General View of Robin-Janvier Six Wheel Lorry.

The road wheels  $R_1, R'_1, R_2, R'_2$  are mounted on axles  $E, E'$ , the latter being entirely independent from each other. Centrally between the two, and transversely to the frame, is a spindle A, which supports the front end of the chassis by the intermediary of the two semi-elliptical springs  $r^1, r^2$ . The latter are connected to the spindle A by special arched-shaped pieces P. Exactly below each of these, and mounted loosely on the spindle A, are balanced arms made up in such a way as to be exactly similar to inverted semi-elliptical springs. The distance between the two axles  $E, E'$

owing to there being four points of support, which form an indeformable quadrilateral block.

Some general particulars of the vehicle illustrated in Fig. 3, and which has been built to the order of a large flour-milling concern in Austria, may now be given. It is designed to carry loads of 5 tons up gradients of 1 in 8½, and 7 tons up inclines of 1 in 10, at speeds of from 7½ to 9 miles per hour. The main frame is of channel steel construction, the front end, beyond which no part of the mechanism, not even the starting handle,

projects, being of very strong construction in order to act as a buffer in case of accident. The motive power is furnished by a four-cylinder vertical engine of 24-30-h.p., designed to use either petrol or alcohol as fuel; it is located under the driver's seat, the latter being so arranged that it can be readily removed to give access to the various parts. The ignition is by low tension magneto, and a half-compression device is provided to facilitate starting. The normal speed of the motor is 850 revolutions per minute, but it can be run at any rate from 250 to 1,000 revolutions. The power is transmitted through a leather-faced cone clutch to a gear-box giving three speeds forward and a reverse. Between the change-speed gear and the differential shaft is introduced a reducing gear-box somewhat on the lines of that dealt with in our recent description of the 1906 Richard-Brasier cars, and by means of which a further three speeds can be obtained, giving a total of six, when travelling in a very hilly district. The final drive from the differential shaft to the rear road-wheels is through side chains of the silent type. As regards brakes, a pedal actuates double contracting shoes on drums connected with the sprockets on the differential shaft, while, as will be observed from Fig. 3, the front faces of the hubs of the hind wheels are extended to form drums, on which, by means of a hand lever, a wire cable is coiled, the winding of the latter on the hub giving a powerful braking effect. The front wheels are 850 mm. diameter, shod with iron tyres 90 mm. wide, those at the rear being 950 mm. by 180 mm. The length of the wagon platform is 13 ft. 6 in., and the track 4 ft. 11 in. The weight of the chassis is about 4 tons, or complete with lorry platform  $4\frac{1}{2}$  tons.

Fig. 4.—Elevation of Chassis of Robin-Janvier Six Wheel Omnibus.

M. Janvier is also applying the system to motor-omnibuses, but, while the principle remains the same, the arrangement adopted, shown in Fig. 4, differs from that of the lorry. The front and rear pair of road wheels all act as steerers, while the driving is done by the central pair. The action is similar to that which would take place were the chassis mounted on two four-wheel bogeys, suitable connections S enabling the axle E3 of the middle wheels to act the part of the rear and front axles in the front and hind bogies respectively. It is claimed for this design that not only is the load distributed over six wheels in place of the usual four, but that, allowing the chassis is somewhat longer than that of the usual motor-'bus, the vehicle can, owing to the front and rear wheels all assisting in the steering, be turned in a smaller circle than four-wheel machines.

THE employees of the Wolseley Tool and Motor Car Company have recently had their annual outing. Those employed at Adderley Park, Birmingham, to the number of 700, journeyed by special train to Blackpool. The employees at Crayford, numbering 1,000, were conveyed by special train to Hastings.

THE Corporate Property Committee of the Scarborough Corporation recommend that in future the charges for motor-cars crossing the Valley Bridge should be for each person in any motor-car, exclusive of the driver,  $\frac{1}{2}$ d., and for each motor-car, including driver, 1d. It has also been decided to write to the N.E.R. Company asking them to give instructions that their motor char-a-bancs should not pass over the Valley Bridge.

## THE MOTOR UNION MEET AT BATH.

THE sound of the horn and the dust of the roads will be heard and seen respectively next week-end in the town of Bath, where an inter-club meet will be held in connection with the general meeting of the Motor Union in the West of England. An interesting programme has been arranged, the Marquis of Bath having extended, through the Somersetshire Automobile Club, an invitation to visit Longleat. Longleat is seventeen miles distant from Bath, and the house, with its grounds, forms one of the most attractive places in the country for an inter-club meet. There is a hill very suitable for a hill-climb, and it has been arranged that in the course of the afternoon there shall be an invitation hill-climbing contest. The Mayor and Corporation of Bath intend giving a civic welcome to the Union, and the old Roman Bath and other points of interest will be specially thrown open to members of the Union on Saturday the 21st inst. In the evening a dinner will be held at the Pulteney Hotel, and those who intend to be present are invited to communicate with the hon. secretary of the Somerset A.C., Mr. A. Armitage, at Haygrass, Taunton.

Tramcar and omnibus combine to render the natural beauties about Bath accessible to the visitor with a few pence to distinguish him from the pedestrian without. The Bath Electric Tramways, Ltd., is responsible for both enterprises, having been one of the first tramcar authorities to recognise the value of the motor-omnibus as a feeder to its older form of public service; and it is significant of the value of the newer method

of locomotion that whereas the steepest gradient up which the tram travels is 1 in 10, the motor-'bus carries passengers up to Lansdown, a steep place with a rise of 1 in 7. There is a great deal of pleasure traffic by tramcar up to Coombe Downs and through the Avon Valley. The regular motor-'bus service extends as far as Box, Corsham, Chippenham, Bradford-on-Avon, Trowbridge, Devizes, &c., while special 'buses are always run to suit the convenience of parties of not less than twenty passengers. On the 28th ult. the daily service was extended to Frome, a journey occupying about an hour and a half. During the early days of July a circular trip via Corston, Marksbury and Chewton Mendip to Wells and Glastonbury, returning via Shepton Mallet and Radstock, was run, as well as a special trip via Bristol to Weston-super-Mare, while on Thursday last the longest motor-'bus excursion which had hitherto set forth from Bath was made to Stonehenge.

Motorists have always been welcome in the ancient city, the Corporation of which was among the earliest to employ a motor vehicle for ordinary service, a Wallis and Steevens tractor being used for the haulage of road material. The town possesses several good garages and repair shops, and those who participate in next week's important gathering may reasonably anticipate spending a pleasant time.

WE hear from several motor body builders that the landaulet-limousine is just now the fashionable type of motor-car body in the West End.

## SOME CURRENT TOPICS.

### Pressure or Gravity Feed for Carburettors?

Elsewhere in the present issue will be found an article under the above heading which will no doubt be read with considerable interest. The question raised is one of more than passing importance, especially now that such a great development is taking place in the adoption of motor-vehicles for public service and commercial purposes. Since tube ignition and its external flame was superseded by the electrical method, reports of cars being burnt up have, fortunately, been few and far between; the records of the motor insurance companies, however, show that damage to motor vehicles by fire is still occurring, and it is therefore well worth discussing whether the danger in this

holes at the creases if allowed to remain too long in the same position. As regards spare outer covers, these should never be carried on the car unless protected by a dust and water-proof covering. To allow rain and dirt to get at them means that the fabric will be rotted before it is used. If the tyres are stored away in the garage or at home they should be suitably wrapped to keep the damp and dust from them, and should be stored not only in a dark room but in one that is dry and has an even temperature of from 60 to 70 degrees F.

### Increasing the Efficiency of Petrol.

Many efforts have been made in recent years to increase the efficiency of petroleum spirit as the fuel for internal combustion engines, and at one time it looked as if picric acid would come into extensive use as an enriching medium. Latterly, however, little has been heard of it, owing no doubt to its tendency to separate out from the petrol and also to its corrosive action. A new product having a similar object has recently been

The Touring Club of France's Celebrations—Motor Vehicles en route from Paris to Versailles. (See page 428)

respect is increased in the case of cars fitted with a pressure-fed petrol supply, as compared to those in which the spirit flows to the carburettor by gravity alone.

### The Care of Spare Tubes and Covers.

Many motorists cause themselves unnecessary expense by the spoiling of spare inner tubes and outer covers as a result of neglect in caring for them until they are ready to be used. The only safe way to carry spare inner tubes is to roll each one up separately, taking care to see that the valve stem is left on the outside of the roll, and then put them each into a separate bag well provided with French chalk. Each bag should then be so stored away that it will not rub against the other or against any tools, otherwise the tubes will be chafed and damaged if they do. Many users are careless enough to carry inner tubes in their tool boxes, where they are chafed by the tools and rotted by the oil. After a tube has been carried a few weeks it is well to take it out of the bag and refold it, as it is likely to fall in

brought to our notice by Mr. Howard S. Fulton, of Chicago, who has sent us a sample of "No-Ko-Rode," which, when added to motor spirit, is claimed to prevent the corrosion of sparking plugs, increase the power, steady the machine, lessen the wear and tear of engine, decrease the smoke and odour and effect a great saving in petrol. Mr. Fulton, in describing the action of No-Ko-Rode, explains that, in all petroleum distillates, such as petrol, there is a certain segregation which causes the lighter fractions to be consumed first. As the contents of the petrol tank are used, they directly increase in gravity, decreasing in their affinity for combination with air, and become a more concentrated solution of the lower fractions and lubricating properties. By adding the new product to the spirit, the constituents of the latter are converted into a homogeneous mixture of a constant gravity, the result of which is a complete combustion of the fuel and consequent economy in consumption. We intend to submit the new preparation to a careful test at an early date, and hope to refer to it again in a subsequent issue.

MR. RADFORD COOKE is advocating the formation of a Society of Alcohol Research.

FIVE 18-h.p. White steam chassis have been shipped by Mr. Frederic Coleman to Holland. These have been purchased by the Dutch Government, and will be despatched to Java, where they will be employed in carrying the mails.

SIR CHARLES ROSS, of Quebec, Canada, has just acquired a 10-h.p. Star car from the Star Motor Agency, Ltd.

A MOTOR-CAR figured in a chase after some poachers in Leicestershire on Monday morning, and was successful in assisting the police to effect their capture.

FROM the "Era" office a challenge cup value 40 gs., for an automobile handicap among cars belonging to members of the dramatic profession, is being offered for competition.

THE Scotland Yard authorities are searching for a motor-car which has knocked down a cyclist near Hassocks, and apparently made off without ascertaining the injury caused.

A SPECIAL 60-h.p. Mass racer, which is stated to have attained a speed of 120 miles per hour in its trials in France, has, we hear, been entered for the speed trials to be held at Saltburn-on-Sea to-day (Saturday).

MR. MOORE, of Preston Street, Brighton, is driving an Argyll car fitted with Moseley tyres through the south, making a trip of about seventy miles each day. He proposes to continue his run until the tyres have been completely worn out, in order to ascertain their length of life.

THE A.C.G.B.I. is inviting owners of motor-cars to lend cars to take the members of the International Parliamentary Union to the Crystal Palace on the afternoon of the 26th inst. About 300 vehicles will be required, and offers of help should be addressed to the Secretary of the Club, 119, Piccadilly, W.

IN connection with the Orpington and District Horse, Dog, and Poultry Show a cup value £10 will be presented by the A.C.G.B.I. for the touring motor-car having the best appearance. The entries of private owners are being invited, and forms can be obtained on application to Mr. G. M. Kenyon, hon. sec. Kent A.C., Wycliffe Lodge, Bromley Park, Bromley.

FROM Messrs. Bransom, Kent, and Co., of Great Eastern Street, E.C., comes a copy of their new catalogue of motor accessories, which affords some idea of the comprehensive nature of their stock. Everything that a motorist is likely to require in this direction is included in the list, which extends to over a hundred pages, and will prove a useful book of reference.

WE learn that the style of the firm manufacturing the Armadale cars has now been altered from Toboggan Motors, Ltd., to Armadale Motors, Ltd. For some time past it has been apparent to the directors that the title of "Toboggan" was unsuitable. They have therefore, by special resolution of the company and sanction of the Board of Trade, made the alteration. The company is now installed in its new works at Trinity Road, Wandsworth Common, S.W.

THE Sun gas dry system of acetylene generation has now been applied to the purposes of the motor-car, securing cleanliness in the manufacture and combustion of the gas, which is absolutely pure. The light can be turned down and left burning for any length of time without any carbon deposit accumulating on the burners. The apparatus, as supplied by the Sun Gas Co., Ltd., of 15, Tothill Street, Westminster, comprises a generator, gas bag, and burner. The generator consists of two compartments, the lower one for soda and the upper one for carbide. Pressure upon a knob at the top secures the passage of a supply of carbide to the soda, with which it is thoroughly mixed. As the gas generates it passes to the gas bag—the size recommended holding one foot of gas, sufficient to supply one burner for four hours. The system ensures cleanliness and purity of light, the disadvantages associated with water being entirely absent. The residue, which is such an odorous feature of the wet process of acetylene generation, is by this dry process left in the form of a powder, which can easily be shaken out of the generator without any objectionable effect.

## HERE AND THERE.

THERE are twenty premises in Brighton licensed for the storing of motor spirit.

HIS GRACE THE DUKE OF MARLBOROUGH last week drove to the National Fire Brigade Camp, near Guildford, in the

20-h.p. Dennis landaulet belonging to Mr. Ferdinand Smallpiece, J.P., the Mayor of Guildford.

Mr. G. H. WAIT, of Leicester, has just supplied a 24-h.p. Spyker car to Sir Edmund Verney.

ARCHDEACON HODGES, himself a motorist, has told a diocesan conference at Ely that every bishop ought to have a motor-car.

THE next run for the Aga Khan challenge cups for motor-cars will take place on the 30th inst. It will be over a course of 142 miles, to Satara and back to Poona.

MESSRS. HAMPTONS, of Pall Mall, S.W., are now making a feature of warehousing the motor-cars of private owners at their depository in Queen's Road, Battersea Park.

THE illustration herewith depicts a 32-h.p. Siddeley car recently supplied by the Wolseley Co. to Mr. Andrew Carnegie. The vehicle is intended for station work to carry visitors and their luggage, and a special brougham-wagonette body has been built for this purpose by Messrs. Mulliners, of Birmingham. The seating capacity is for one passenger at the side of the driver, three in the brougham, and two or three on each side of the wagonette. The seats are made in sections of 2 ft. 6 in. and 1 ft. 6 in., so that baggage can be put in and leave a seat behind for a servant on each side. The back end is also hinged

at the sides, and opens in two halves from the centre, thus leaving the entire width for admitting luggage. A canopy extends from the brougham top to cover the rear seats, and removable curtains are fitted to the sides and back with transparent mica windows. The car, which is finished in natural wood and varnished, is geared to do a top speed of twenty-two miles an hour.

THE F. W. Peckham Syndicate, Ltd., have issued a coloured poster of their well-known car, and it may be interesting to note that the 8-h.p. Maxwell car in the Scottish Trials was the identical vehicle which a few days before completed the journey from London to Edinburgh and back under the auspices of the Motor-Cycle Club.

WE have tried a sample bottle of "Silesto" solution, which is being placed on the market by Messrs. James Williams and Company, 1, Great Hampton Street, Birmingham. It not only brightens silver and nickel-plate but by repeated applications actually leaves a small deposit of silver on the article polished, thereby ensuring the durability of everything so treated.

CALLING in at the depot of the Lancaster Motor Garage the other day, we saw a number of Mass cars ready for despatch to customers. Lieut. Ledgard, R.N., has acquired a 24-30-h.p. vehicle similar to the one which competed in the recent Scottish trials; Mr. H. J. Pinnock, of Henley, has taken delivery of a 16-20-h.p.; while among recent purchasers of the 14-h.p. Mass cars are Mr. H. Clinton Baker, of Bayfordbury, Herts; Mr. C. Vivian Dudley, of London Colney, St. Albans; and Mr. A. Masser, of Leeds.

MR. L. W. K. LANEN, of the Hague, has been appointed agent for Argyl cars in Holland.

A NEW showcard in four colours has just been issued by Messrs. J. B. Brooks and Co., Ltd., of Great Charles Street, Birmingham.

MESSRS. GALL AND INGLIS have issued a strip contour map of the Highland road from Edinburgh or Glasgow to Inverness which will be of service to motorists going north. Uniform with this is a similar map of London to Malvern by way of Cheltenham or Worcester. Accuracy and good printing are characteristic of each.

EALING is one of the most flourishing of our London suburbs, and the existence of several concerns in the district well able to assist local motorists, may be regarded as evidence of local prosperity. Opposite the South Ealing Station is the South Ealing Motor Co., with its garage and repair establishment, and we shall be pleased to have the addresses of other efficient repairers in the district.

THE question of the standardisation of lamp fittings, with particular reference to gas-lamp fittings for head lights, has been considered by the Tyre and Accessories Section of the Society of Motor Manufacturers, and it has been resolved to recommend for adoption as standard sizes for the fork brackets 6 in., 7½ in., and 8½ in. respectively between centres, the fork ends to be 13-32 in. at base of taper in the former case and ½ in. in the two other cases.

THE "Pneu-Cure" winged plaster, a sample of which has just reached us from Messrs. Brown Bros., should undoubtedly prove a great boon to motorists. These plasters, which are manufactured in cycle and motor sizes, enable the fabric of the

cover to be repaired without difficulty, and at very little cost, they being so prepared that they stick immediately. The wings of the plaster fit between the rim and the tyre, and hold it securely in its place.

WHEN in Scotland on the occasion of the recent Trials we learned that Messrs. Peter Lee and Sons, of Glasgow, are meeting with an increasing demand for their "Mobilene" motor oils and greases. The firm are pioneers in this branch across the Border and claim to have furnished supplies to the first car in Scotland. In addition to lubricants, Messrs. Lee also devote attention to the supply of petrol, being the wholesale distributors for "Shell" motor spirit.

THE negotiations which were taken up a considerable time ago between the Scottish Automobile Club and the Glasgow Corporation with respect to the regulations governing the use of carriage drives in the public parks have had a satisfactory determination, and bye-laws have now been framed according to motor-vehicles the same rights as other vehicles. The suggestion was that the former should be excluded during a considerable portion of the day.

WE learn that, owing to the steadily increasing business, the Turner's Motor Manufacturing Company, Ltd., is being reconstructed, a new company under the same title having been registered with a nominal capital of £50,000. Considerable extensions are now being made to the works, and it is intended to devote considerable attention to the manufacture of vehicles suitable for commercial purposes. A light steam chassis to carry a load of two tons has already been designed, and a number are in course of construction, the first chassis made having proved extremely satisfactory on its road trials. The directors of the new company will consist of Mr. James Stone Dumbell, Major Charles Leveson-Gower, Mr. Percy L. Jepson, and Mr. J. Burns Dumbell, the latter being the managing director. No shares will be offered to the public, the requisite capital having been subscribed privately.

WE learn from Messrs. Ducros Mercedes, Ltd., that Prince Hatzfeldt has just taken delivery of a Mercedes 70-h.p. 1906 car.

MAJOR T. McNALTY, the chief of the Army Mechanical Transport, has placed an order with the Arrol-Johnston Agency, Ltd., London, for one of the new 12-15-h.p. Arrol-Johnston cars.

A CAPITAL pamphlet on the tyre question has been published by the Palmer Tyre, Ltd., in which is comprised a lucidly written and clearly illustrated account of their well-known motor tyre.

FROM Messrs. Friwell, Ltd., comes a copy of their 1906 catalogue of motor accessories. The list is clearly printed, and its exhaustive nature may be gauged from the fact that it extends to 100 pages.

THE withdrawal of the steamer from Glasgow to Millport having dislocated the delivery of the newspapers, one of the Glasgow morning journals is now being taken by train to Fairlie and thence by motor-boat to the Cumbraes.

IT is complained by the Works Committee of the Kensington Borough Council that large numbers of public street lamps are from time to time knocked down or damaged by motor and other vehicles. Owing to the difficulty experienced in recovering compensation due to the lack of information as to the offending vehicles, the committee recommend that a reward of 5s. be offered for information upon which proceedings can be taken for the recovery of damages.

MR. HENRY ADAMS informs us that, owing to the increase in business, he has transferred under royalty to his son, Mr. G. T. Adams, and Mr. F. R. Bonamy Price, his business as manufacturer of the Adams patent motor jacks and motor-car elevators, which will be carried on as usual at 30, Monson Colonnade, and also at 16, Newton Road, Tunbridge Wells, under the style of Messrs. Adams, Price and Co.

MESSRS. PARKE, DAVIS AND Co., 111, Queen Victoria Street, E.C., are bringing out a new liquid soap under the trade name of Ethol. This is specially prepared for the use of motorists, the presence of certain ingredients of a costly and effective nature giving it particular value for cleansing purposes. It is said to have a remarkable affinity for grease of every kind, combining with it, rendering it fluid, and thus capable of being rinsed off the skin. The need of a short and simple method of removing stains has been increasingly felt since motoring has become the pastime of thousands. The little interruptions which occasionally occur involve the engineer of the party in a close acquaintance with oil and with a peculiarly adhesive compound of ground metal, road dust, and grease, which possesses remarkable distributive properties. Motorists have often sought to get rid of such dirt by means of petrol, but this agent quickly evaporates, redepositing the grease. Avoiding such features, Ethol promises to be a "boon and a blessing" to motorists.

DUST is a serious matter to the man in the street; it is of equal concern to the man in the car, whose clothes are often ruined by the dust thrown up by vehicles other than his own. Now the "Witch" Dust Extractor Co., of Temple Row, Birmingham, comes at the opportune time to clean the dust-filled clothing of the motorist with an apparatus designed to extract every particle of dust from clothing, upholstery, rugs, etc. Experience has proved the inefficiency of mere brushing or beating the clothes, for the dust has been driven into the fabric; hence the value of the vacuum system of cleansing adapted by this company to the needs of the motorist. The outfit comprises the extractor, a length of metallic tubing, an upholstery nozzle and a length of brass tubing. It is easily operated by the feet, acting upon clothing, coats, dresses, rugs, cushions, etc., with a quality of result otherwise impossible. The dust, instead of being scattered about the apartment in which the cleaning takes place, is drawn into the machine, and the device should be regarded as an essential fitment in modern garages and in hotels where car owners assemble. In fact, in these latter places it should be adopted without delay, affording opportunities of assisting clients otherwise impossible. Its general adaptability should also make the "Witch" extractor popular with private motorists for their own use.

## CORRESPONDENCE

[Letters to the Editor should be addressed to the offices,  
27-33, Charing Cross Road, W.C.]

### HILL CLIMBING COMPETITIONS.

TO THE EDITOR OF *The Motor-Car Journal*

SIR,—I have read with considerable interest the correspondence criticising the hill-climbing formula used in connection with the various hill climbs which are being held in various parts of the country. Personally, I am somewhat surprised that the Racing Committee of the Automobile Club have not taken this matter in hand and made it impossible for open competitions to be run other than under a proper formula of the A.C.G.B.I.

Leaving this question aside, however, I think there is a much broader issue at stake, viz., as to the value of these hill climbs. In the first instance they were organised with the idea of stimulating

courses, there will be some manufacturers who will not scruple to avail themselves of the "maker's amateur;" in fact, such unsavoury individuals exist to-day in the motor industry, but with a strong ruling body this abuse would be dealt with very effectively.—Yours truly,  
CHARLES JARROTT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Now that the hill climbing season is in full swing I think great benefit would be conferred on all interested in motoring, whether from a private or trade point of view, if you could open your valuable columns to a discussion on the subject "Are hill climbs—as at present organized—useful, and what modifications, if any, in their organization are desirable?" What does the public think? What do the manufacturers think? These are two interesting questions, though the former is, or should be, much the more important.

The view which the motoring public takes of hill climbs is very important to the manufacturer, as on this depends the value to him of the satisfactory running of his car in competitions of the kind. Although from a sporting point of view the manufacturer, as well as the private owner, doubtless likes his car to do him credit, the amount of importance which his prospective customers attach to his success is the principal point with the former. The present haphazard manner in which the power of the various makes of cars is listed by the manufac-

Messrs. Ernest and Albert Brown on their 20-22-h.p. Brown Cars at Slough.

interest between the members of the various clubs and obtaining publicity as to the capabilities of motor-cars in climbing hills. This time, however, has now passed; the sporting side of the whole question has entirely disappeared and these so-called "sporting contests" have now developed into nothing more or less than trade demonstrations. The result is that every subterfuge possible is adopted by the various manufacturers interested to enter machines which have either been specially built or specially faked up for the purpose of winning the event. Therefore, any results obtained are valueless from the point of view of educating the public as to the respective merits of the various makes, and we have recently had instances of how an honest manufacturer entering a *bona fide* standard machine is handicapped by the latitude allowed to other manufacturers to enter vehicles of special construction.

I am of opinion that these various events, if carried out on sporting lines, can do a great amount of good, but I certainly think the various provincial clubs should take steps to see that the events are not taken advantage of by manufacturers who, solely for commercial purposes, take part. If every club agreed that no members directly or indirectly connected with the trade should take part in any of these events, and that every member so taking part should reside within a twenty-mile radius of the head-quarters of the club, and should also be a *bona fide* owner of the car driven by him in such event, and be prepared to submit to the organising committee, if necessary, proof of such ownership, a very undesirable element in connection with these various trials would be eliminated and the sporting character of each event retained. Of

turers has an important bearing on the subject. Then, again, the various formulæ employed by the different bodies who organize the hill climbs are very confusing and are apt to lead to anomalous results.

The opinions of your readers would be very valuable, and many suggestions would, no doubt, be forthcoming with regard to the points briefly referred to above. As one commercially interested, I should read with great interest the opinions of your correspondents, and as the subject is of great importance, and one which can be looked at from so many points of view, I trust you will allow the question to be discussed in your columns.—Yours truly,

L. M. SEABROOKE.

### A NOVEL DESIGN OF PETROL MOTOR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Like S. J. S. in the *M.C.J.* of June 30th, I am working on a novel design of petrol engine. The main point is the perfect balance. I have eight cylinders mounted on two discs or face plates; each disc carries four cylinders facing each other at the rim. One piston reciprocates between two cylinders, something like the double-cylinder gas-engine, but in the centre of piston I have a roller fitted looking towards the centre. This roller runs in a switchback groove in a cover, and as the pistons are driven out—getting pressure alternately at each end—they give the discs on which the cylinders are mounted a rotary motion round the fixed disc. The reciprocation of the pistons does

not alter the balance of the motors, as the move is in the line of the main shaft and not from the centre. The valve gear is very simple and is on the principle of Corliss valve; there are very few working parts and the motor is a flywheel in itself. I should be glad to hear what some of your readers think of the design of the engine.—Yours truly,

S. H. E.

### EXPERIENCES WITH TYRES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to Mr. Henry Moore in your last week's journal, re experiences of the Moseley tyres, I have driven on the Moseley Perfect tyres over the whole course of the Scottish Reliability Trials, and am delighted with them; they are certainly the easiest running and the most reliable tyres I have ever used, and also keep the coolest when running at fairly high speed. On my return to Lancashire, after having driven them quite 2,000 miles on my six-cylinder Belsize car, they hardly show any perceptible wear, and I consider that punctures are no longer serious troubles of the road, when your tyre can be taken off and put on again in eleven minutes.—Yours truly,

ESTAM

(MRS) ED. A. RILEY.

Mr. J. E. Mills' 8-h.p. Clement-Talbot Car, which gained highest marks in the Open Class B in the recent Irish Reliability Trials. The Vehicle made an absolutely Non-stop Run and went through the Trials without a single adjustment of any description—a noteworthy performance in view of the fact that it has been run for business and pleasure 10,000 miles during the last ten months, and was entered in the Trials without any preparation whatever.

### DRIVERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I wish to take the liberty of approaching the above subject in your columns, with a view, if possible, of a thorough discussion being brought about, in order to ascertain whether something can be done to overcome the difficulty experienced in securing good drivers for cars. I have now for a number of years been in the position of having to supply drivers both for the cars I have been selling, and also for friends, for other makes, and in a good many cases it has been a very difficult matter to secure really good men.

In the first place, whilst there are hundreds of drivers who cannot obtain employment, in the second place, there are hundreds of owners of cars who cannot secure competent, capable and trustworthy men to look after and drive their cars. The two factors, I think, that have been largely responsible for this unsatisfactory state are, in the first case, the rapid growth of automobilism, which has allowed insufficient time for men to be properly trained and get the necessary experience to qualify themselves, and, in the second case, the "schools of motoring" that have sprung up in recent years.

In discussing the first factor, I think it is patent to all those interested in automobilism that, although it is a fairly simple matter to learn the rudiments of the car and driving, it naturally takes a considerable time for one to thoroughly master the same in every detail. In consequence, owing to the sport and industry being so very young, and its growth so very rapid, there has not been time for numbers of men to acquire the necessary experience.

Upon the second point I have taken the trouble recently to carefully study the methods of instruction given by several well-known establishments created for this purpose. I must say I was very pleased indeed to find in several cases that instruction was being given in a very thorough manner, and also, in comparing the replies of students who had attended, with the examiner's questions, a very large percentage showed an extremely good theoretical knowledge not only of the construction of cars in very great detail, but also what I consider to be of equal, if not greater importance, the principles of the functions governing the successful running of the same. This has led me to believe that there is now growing in the country a generation of drivers that will in time be exceptionally competent, and be the means of improving and assuring the more general success of motor vehicles.

To qualify this statement, it is a known fact that whilst cars of numerous makes are working regularly and satisfactorily, there are other cars of the same makes which are not so successful owing to their not being looked after and driven properly.

Unfortunately, however, there is one impediment to this result, namely, that whilst drivers are able to be initiated and instructed in the work of looking after and driving cars, they are prevented from reaping the result of their knowledge owing to the lack of actual road driving experience. The reason for this is perfectly clear. The schools of motoring are run for commercial reasons, and for a certain sum they can afford to give only a limited amount of tuition, and, as a rule, the students who attend these schools can only afford to pay the fees for perhaps one month's instruction, or, at the outside, two months'. During this short period, by diligent study, they are able to acquire a general knowledge of the subject, and perhaps a little practical experience in actually looking after and driving a car. At the end of this their funds are exhausted, and they anticipate it will be an easy matter to get positions as drivers of cars; but, on attempting to do this, they are naturally met with the question as to the length of experience they have had in driving motor-cars, and when they have to admit this has only been short, the would-be employer naturally does not feel inclined to trust his valuable car in the hands of such a driver, as he is fully aware that, even if he has sufficient confidence in the man's knowledge of the car, he has not the confidence to risk being driven by a man with such a slight experience of actual driving.

In consequence, there are hundreds of men who have passed very satisfactorily through, say, a month or two months' instruction, and have a very good knowledge of cars, but before they can be considered as qualified drivers, and before they can be relied upon to relieve the present difficult situation, they must have more actual road experience. It is with a view, if possible, of coming to some solution to overcome this difficulty that I now bring the matter before your readers.

At the moment one suggestion appears to me worth consideration, and that is the establishment of a garage where men could get the necessary experience. As, however, the men would probably be unable to pay anything for this additional instruction, and as is all probability there would be great difficulties in making the garage itself pay, it appears to me that it would either have to be supported by the clubs and trade societies representing automobilists, or by other charitable means. As the matter equally affects both the private users of cars and the manufacturers and agents, a scheme might be developed which both these sections of automobilism would support.

There are, no doubt, numbers of wealthy motorists who perhaps would be willing to subscribe either their old cars, or send contributions, whilst the trade can also help in a similar manner. At the same time, something might be done so that the establishment itself could be made to earn something to assist it to be self-supporting.

Of course, I fully recognise the difficulties of the question, and I have made the suggestion merely with a view of inviting others to assist, if possible, in devising some scheme that would satisfactorily solve the "driver" question. The garage could either be under independent management, or perhaps it would be advisable to put it under the control of one of the recognised "instruction" establishments.

I trust you will pardon my having taken up so much of your valuable space on this subject, but it is one that I feel is of extreme importance, and the sooner something is done to encourage the production of properly trained and qualified men to drive and look after motor-cars, the better it will be for automobilism generally.

This letter is written not with any idea of the disparagement of those institutions or of manufacturers and agents who lay themselves out to instruct drivers, but rather to consider the question in its broader details.—Yours truly,

PERCY RICHARDSON.

### THE RURAL POLICE AND MOTOR INIQUITIES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—That the rural policemen are too ready to make the most of the slightest mishap to the motorist has been forcibly brought home to me in a case which the Tonbridge police thought it proper to bring against the chauffeur who was driving my car. It shows to what an absurd length these country policemen will go.

I went into Kent with my motor-car for the week end three weeks ago, starting with the number plates on the back and front all right, and was not aware, until I reached my destination, fifty miles from London, that the back number plate had 'dropped off' through the wire which

attached it snapping. When I returned to town on the Monday evening I had a visit from a policeman in the suburb where I reside, informing me that my number plate had been picked up and was lying at the Marlborough Mews Police Station, where I could call and get it. The London police were perfectly satisfied when it was explained to them that the number plate had dropped off accidentally. There I thought the matter would end, but, to my astonishment, on the following Saturday, over a week after the occurrence, a policeman from Tonbridge called upon me saying that it had been reported to them by one of their policemen that I went along the road leading to Pembury without a number plate on the back of the car. I told the policeman that, immediately the discovery was made by us that the plate was gone, we had a temporary one fixed, and the London policeman being quite satisfied with the explanation, I did not see there was any necessity for further interference. However, the driver received a summons, and at Tonbridge was fined 10s. and 13s. 4d. costs. I attended the court, as I was anxious that the driver's licence, which had never been endorsed (although he has driven for several years), should not be disturbed with such a trifle, the driver being a highly respectable young man. The magistrates, however, did endorse the licence.

Before our case came on the cases preceding it were really so trifling that my general impression of these Tonbridge policemen was that they simply made cases out of anything they could in order to justify their existence. Of course, as regards motor-cars from London, it gives them an opportunity of a nice little holiday to town at the motorist's expense. A flagrant instance of this was that of a driver whose back lamp went out. Even one of the policemen said that the lamp was lit when the car left Tonbridge Hall, but that fifty yards or so from there a policeman saw the light go out and did not draw the driver's attention to it, but took the number of the car instead; and, to the driver's astonishment, a week afterwards a summons came for him to appear at Tonbridge in the same way our man had. Surely it was the duty of the policeman, on seeing the lamp go out, to call the driver's attention to it without making a case of it. I think there might be some alteration in the law of conducting police affairs of this kind, to do so by correspondence instead of piling on expenses by sending policemen all the way from the country up to London to deliver the summons, as well as involving the necessity of a motorist appearing so far away from his place of residence. In my case I should have thought the fact of the London police being satisfied with my explanation would have been sufficient for the Tonbridge magistrates; but no, and the whole thing seems a perfect farce.—Yours truly,

J. G. BARNETT.

### SOLID TYRES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to "W. J. A.'s" letter in the *M.C.J.* of the 30th ult., re solid tyres, perhaps my testimony may be of service to him. During more than 5½ years I have been using a 5-h.p. Wolseley car in medical practice. I have tried both pneumatic tyres and solid tyres, and I find that solids on the back wheels and pneumatics on the front give satisfaction. I once tried solids fitted to the Michelin rims, but this was not a success. Now I have Reilloc solids with the maker's rims; these tyres I have had in use for about a year, and they show but little damage. I find solids much more economical than pneumatics, and one is freed from puncture troubles so far as the driving wheels are concerned.

Before having solids fitted it is very essential to make sure that the car and mechanism will bear the extra vibration. Perhaps the makers of the car would be the best judges of this. Although my car is a Wolseley, it is one of the older, and I believe stronger types, and it takes solids satisfactorily in every way. Whatever tyres are chosen, I would recommend that a proper understanding be arrived at as to guarantee. Some makers give a guarantee with their tyres; others do not.—Yours truly,

T. W. AIRD.

### CLEANING RADIATORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to Mr. J. Tribe's query in the *M.C.J.* of the 23rd ult., if it is grease that his radiators are furred up with, my advice to him is: when he brings his car in from a run let him drain all the water out while it is hot and let the car stand until next morning, when it will be fairly dry inside the water system. Then let him disconnect the radiator pipes and cork them up and fill up the radiator with petrol, and, better still, take them off if he can, so as to be able to turn them over and over to make the petrol flow inside. Of course he could fill up the whole system if he likes, but I never find this necessary; the petrol will dissolve out all the fur which will come out and leave the radiators quite clean inside.

In my opinion any lime deposit from the water never adheres to the inside of radiator pipes hard, as it is prevented from doing so by the grease which finds its way in from the pump lubricator, so that by washing out with petrol one is always able to get them perfectly clean inside. I need hardly mention that if Mr. Tribe fills up his whole water system as I suggest with petrol he must not dream of starting up his engine while the petrol is there, as it would be very dangerous.—Yours truly,

T. W. N. QUINN.

### RESTRICTION OF TRADE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Among the many points which motor-car agents will probably have to discuss at no distant date is that of exhibitions. Being now practically compelled by the manufacturers to engage to take a much larger number of cars than formerly, I recently decided to apply for space on my own account at one of the shows in London, and, to my surprise, I find that I shall be prevented from doing so, owing to the makers having signed a bond to only exhibit their cars at the November show. While granting that a manufacturer has a perfect right to please himself as to which show he will and will not exhibit at, I do not think he should at the same time take upon himself the right of preventing an agent from exhibiting where he chooses. To my mind such limitations are in restriction of trade, and I should be glad to have the views of other agents on the matter.—Yours truly,

A LONDON AGENT.

### EXCESSIVE PETROL CONSUMPTION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have a 6-h.p. De Dion car, 1905 pattern, and I find the consumption of petrol very great; I cannot get more than twenty miles out of a gallon. I should feel obliged if you could give me the reason of this. I notice that the exhaust valve gets red hot and about every three weeks requires grinding in. I have tried regulating the carburettor, but with no effect whatever.—Yours truly,

W. H. M.

[The introduction of an extra inlet for air in this instance may be an advantage. It should be located between the carburettor and engine. These air valves are stocked by almost all motor accessory dealers, and

A Snapshot taken on the occasion of the recent Fancy Dress Parade and Carnival at York in aid of the local charity institutions. At the wheel of the 10-12-h.p. Clement-Carlin the background is Mr. R. Scaife, of York.

require but little fitting. The overheating of the exhaust valve may be due to a throttled exhaust, or it is possible that the cam is worn, and not giving the valve a correct lift. It would be as well if this were given attention.]

### A COMMUTATOR QUERY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be glad if you could advise me whether I should put oil in my commutator, as I have been told I ought to. My car is a 16-20-h.p. four-cylinder, with high tension ignition and six volt accumulators and trembler coil. If I run it without oil, I find it chips off little pieces of platinum, but if I put oil in, I seem to get better results. If there is any other way that would be better, I should be obliged for the information.—Yours truly,

L. R. HASSELL.

[The use of oil in the contact breaker is in most cases a great advantage providing that it is made oil-tight, so as to hold a fair quantity. The oil used must be very thin, otherwise it will cause misfiring owing to the contact not being good. The use of oil has the advantage also of keeping the contacts clean, as they are continually being washed, as it were, at every revolution of the commutator. In the ordinary way the contacts get covered with oil, and after a short run become dirty and usually cause a deal of trouble.]

THE ELECTROPHONE.—Replying to several correspondents, the address of Messrs. Gauthier and Co., the agents for the electrophone described in the *M.C.J.* of the 30th ult., is 60, Great Marlborough St., London, W.

## CLUBS AND ASSOCIATIONS.

### NORTH LONDON.

THE fifth outing of the season took place on Saturday, when the run was to the Saracen's Head Hotel, at Dunstable. Favoured with delightful weather, the members arrived about 5 o'clock. After partaking of an *à la carte* tea, Competition No. 1, the lady passenger race, was then held in a quiet country road near the downs. The winner was the hon. sec., who handled his car with great skill. The following are the names and times of the first three competitors:—

		Min.	Sec.
Charles Smith	... 12-h.p. Darracq	... 1	32.5
Max Graddon	... 15-h.p. Panhard	... 1	52.5
Charles Lendrum	... 10-12-h.p. Darracq	... 1	84.5

Starter, F. Horton. Timekeeper, J. T. Barber.

Amongst the members present were Mr. and Mrs. Burney, Mr. and Mrs. Vincent, Mr. Lamb, Mr. Pattison, Mr. Knott, Mr. Smith, Mr. B. Smith, Misses Hampton, Miss Holton, Mr. and Mrs. Carter, Mr. and Mrs. Horton, Misses Horton, Mr. and Mrs. Max Graddon, Mr. and Mrs. Lendrum, Mr. Speight, Mr. Graddon, jun., and Mr. Barber.

8 h. 39 min. 10 sec.; Mr. A. Westmacott's St. Helena, 9 h. 21 min. 45 sec.; Mr. J. Stirling's Eola, 12 h. 50 min. 17 sec.; Mr. S. F. Edge's Napier Major, 13 h. 54 min. 10 sec.; Mr. G. Savory's Teddington, 15 h. 26 min. 37 sec.; Mr. F. C. Blake's Tomoye, 17 h. 56 min. 15 sec.

The first vessel to arrive at Cowes was the Joan, which put in at noon on Sunday, and thus secured the prize for the first boat home. St. Helena arrived soon after 2 p.m. and won the gold medal for boats using heavy oil. Napier Major arrived at 3.30 p.m. It was nearly six o'clock when Teddington finished. Eola was reported seen off Divers Lightship. Firefly finished her separate officially-observed run soon after seven o'clock.

### HUDDERSFIELD.

ON Saturday thirty cars belonging to members of the Huddersfield branch of the Yorkshire A.C. took a large party from the Huddersfield Infirmary to the Moorlands for tea. Seventy of the patients bore traces of their sufferings, but the care of the nurses enabled the drive to be enjoyed without mishap. Those who lent the cars were Mr. Arthur Dawson, Mr. Jos. Hopkinson, Mr. H. Broadbent, Mr. Roberts, Dr. Porritt, Mr. Geo. Hirst, Mr. James Walker, Mr. Charles Sykes, J.P., Mr. J. H. Howarth, Mr. Alex. Mallinson (two cars), Mr. J. Hobson, Mr. H. Roebuck, Mr. W. H. Sutcliffe, Mr. W. Blamires, Mr. Horace Martin, Mr. H. Walker, Mr. A. Hirst, Mr. Eli Sutcliffe, Mr. W. Singleton, Mr. J. L. Crowther, Dr. Edwards, Mr. Norman Shaw, Mr. F. McGrath, Messrs. Netherwood Brothers (three cars, including the repairing motor-van), Mr. J. W. Lawton, Mr. E. Lawton, Mr. Charles Mitchell, Mr. Cliffe, Mr. E. Gordon Learoyd, and Mr. Albert Whiteley.

### BLACKHEATH AND KENT.

The "At Home" on Saturday last given by the Chairman of the Kent Automobile Club and Mrs. Firth to the members of the Blackheath Automobile Club to meet the members of the Kent Automobile Club at their residence, Cromer House, Gravesend, proved enjoyable in every way. Tea and refreshments were served in the grounds to the strains of an excellent string band, the day being delightfully fine, and Mr. and Mrs. Firth were most assiduous in their attention to the guests.

Unfortunately, the hot weather resulted in many members and officers being out of town and unable to be present. Amongst the Blackheath members able to accept the kind invitation were Dr. Hugh Davies, Messrs. Arthur Jackson, T. Marshall, Ronald Mumford, Septimus Nickells and Palmer. Of the Kent members there were present Mr. and Mrs. Austin, Mr. A. Booth Hearn, Mr. and Mrs. Killick, Mr. H. M. Killick, Mr. Cobham, Mr. and Mrs. Gardner, Mr. C. B. Gardner, Mr. and Mrs. Baily, Mr. Keetley, Mr. Ayles, Mr. and Mrs. McFarland, and the Hon. Sec. and Mrs. Kenyon.

### BRITISH MOTOR-BOAT.

ON Saturday seven motor-boats started from Gravesend in the race to Cowes promoted by the British Motor Boat Club. The scratch boat, Firefly (Mr. T. Thornycroft), did not start in the race, owing to not complying with the rule as to freeboard, but it was arranged with the committee that she should start two hours after the race on an officially-observed run to Cowes. The rating of Mr. I. M. Waterhouse's Lady Kate was not ascertained. The time allowances of the other boats are as follow:—Mr. E. H. Clift's Joan,

In the evening a motor ride was given to twenty-two other nurses and servants and members of the staff who were not able to accompany the party in the afternoon. Reference to the gentleman responsible for the successful organisation of the event is made in our Comments on another page.

### NORTH-EAST LANCASHIRE.

THE fine residence of Stanley Grange, Samlesbury, looked at its best when the members of the North-East Lancashire Automobile Club assembled there on Wednesday of last week at the kind invitation of Mrs. Crook. The party was confined to the members of the N.E.L.A. Club and Mrs. Crook's friends. A marquee had been erected on one of the beautiful lawns, and to the strains of a band the happy, though perhaps somewhat, judging from the state of the roads, dust begrimed motorists availed themselves to the full of Mrs. Crook's hospitality. A feature of the meet was the presence of three new steam cars. All told, there were about thirty-five cars present, about a dozen being from Accrington.

### YORKSHIRE.

THE trials which take place to-day (Saturday) at Saltburn bid fair to be the most successful competition the Yorkshire Automobile Club has yet promoted.

The chairman, hon. secretary and some of the committee drove to Saltburn on Saturday last and had a final meeting with the local committee, when all detail matters were settled. The entries total ninety-seven, among them being a 100-h.p. De Dietrich car which com-

peted in the recent Grand Prix, a 100-h.p. Darracq, and a 60-h.p. Mass.

To those driving to Saltburn from the south we would point out that the road from Thirsk through Stokesley and Gainsbro' to Saltburn, while of excellent surface, consists of numerous turns and bends, some of which are exceedingly acute, so that great care is necessary in driving on the part of strangers to the district.

### MOTOR CYCLING CLUB.

ON Saturday the Motor Cycling Club held a 200 miles non-stop competition at Redbourn for the S. H. Fry prize, there being thirteen starters. Only eight of these—Messrs. Baddeley, S. G. Frost, Harwood, March, Mursell, Shuter, Spicer and Sproston—completed half the distance, and in the end Messrs. Frost and Harwood survived. An attempt to decide the contest on a five mile course in the locality was frustrated by the police, but later in the day, on a road nearer London, Mr. S. Frost was adjudged the winner of the competition on a speed judging test.

### DERBY.

TO-DAY (Saturday), the Derby and District Automobile Club is holding a gymkhana at Burton-on-Trent, and members of the Midland clubs will be admitted with their cars on production of their Motor Union ticket. Members of the Leicester, Nottingham, Midland, Wolverhampton, Coventry and Northampton clubs have been invited to participate in the events.

### KENT.

THE second gymkhana held by this club took place at the Maidstone Athletic Ground and was well attended. The following were the events and winners of same:—

Slow Race.—1st, Mr. W. E. Brewerton, 6-h.p. De Dion; 2nd, Mr. H. Gardner, 32-48-h.p. Siddeley.

Victoria Cross Race.—1st, Mr. E. B. Gardner, 40-h.p. Mercedes; 2nd, Mr. T. H. Nash, 16-h.p. Unic (Georges-Richard).

Obstacle Race.—1st, Mr. W. E. Brewerton, 6-h.p. De Dion; 2nd, Mr. A. Batchelor, 15-h.p. Darracq.

Academy Stakes.—In this event a lady had to correctly name an animal drawn by the competitor, who then started his car and raced to the winning post, an event which caused a deal of amusement. The winner of the prize was Miss Birchell, who guessed for Mr. R. C. Morgan.

The last event, Musical Chairs, was the event of the afternoon, the prizes being awarded to the two last left in. Winners: 1st, Miss Queenie Arless, driven by Mr. E. B. Gardner; 2nd, Miss Birchell, driven by Mr. R. C. Morgan.

The Motor Union Medal was awarded to Mr. E. B. Gardner.

The thanks of the club are due to Mr. J. W. Orde, Mr. W. Willis and Mr. Ballin Hinde, who kindly acted as judges, and Mr. G. T. Langridge, who acted as starter.

A 10-12-h.p. two-cylinder Whitlock-Aster was declared winner of the Edinburgh Motoring Club Hill Climb recently held at Sautra Hill. The car was driven by Mr. J. F. Duthie, of Edinburgh.

## HILL CLIMBING CONTESTS.

### LEWISHAM.

THE motor-cycle hill climb organised by the Lewisham A.C. on Saturday was a great success. The timed placings were as follows: those in the first two classes being subject to an examination of Mr. Brice's machine by the judges:—

CLASS 1.—1, R. M. Brice, 3½-h.p. Brown; 2, W. W. Genn, 3½-h.p. Minerva; 3, O. C. Godfrey, two-cylinder 4-h.p. Werner.

CLASS 2.—1, R. M. Brice, 3½-h.p. Brown; 2, W. H. Wells, two-cylinder 5-h.p. Vindec Special; 3, S. Brown, two-cylinder Lurquin Coudert.

CLASS 3.—Tri-cars: 1, B. Pattison, two-cylinder 16-h.p. Daneville; 2, J. Buckingham, 10-h.p. Lagenda; 3, B. Holland, two-cylinder 9-h.p. Singer.

### NORTH-EASTERN ASSOCIATION.

The second annual hill-climbing competition of the North-Eastern Automobile Association was held at Ragpath Side, near Lanchester, on Saturday, July 7th, commencing at 3 p.m. Sixteen motor-bicycles, two tri-cars, and forty-three motor-cars were entered, but only about thirty-five competitors actually took part in the event.

The hill is about the worst in the North of England, the gradient rising 233 feet in a distance of half a mile. The road runs up the side of a bare hill, which thus provides an excellent view for the spectators, a very large number of whom—probably over 1,500—had assembled to watch the event. The surface of the hill is usually much damaged by the winter weather and heavy traffic, but was greatly improved by means of the steam-roller and a staff of road-men, kindly sent for the purpose by Mr. W. Cummings, surveyor to the Lanchester District Council. The steepest portion of the gradient is about 60 feet of 1 in 4½, this portion coming very near the top.

The organisation was in the hands of Dr. McHaffie, of South Shields, the hon. secretary of the Hill-climbing Committee; Mr. J. E. Hodgkin, of Darlington, hon. secretary of the association; Mr. J. D. Piercey Taylor-Smith, of Lanchester, and several other local gentlemen.

The results of the competition are as follows:—

CLASS 1.—Motor-bicycles, capacity not exceeding 5 litres: 1, Mr. J. R. Moore, 3½-h.p. Dene; 2, Mr. E. J. Tiffin, 3½-h.p. Minerva; 3, Mr. M. Palmer, 3½-h.p. Dene.

CLASS 2.—Capacity exceeding 5 litres: 1, Mr. W. E. Galloway, 5-h.p. Vindec Special; 2, Mr. C. B. Grimshaw, 6-h.p. Grimshaw; 3, Mr. W. E. R. Jackson, 5-h.p. Rex.

CLASS 3.—Tri-cars: 1, Mr. J. W. Lucas, 6-h.p. Quadrant.

CLASS 4.—Capacity not exceeding 1.3 litres: 1, Mr. R. T. Cook, 8-h.p. Alldays.

CLASS 5.—Capacity not exceeding 2 litres: 1, Co-operative Wholesale Society, Newcastle, 10-h.p. Alldays.

CLASS 7.—Capacity not exceeding 3 litres: 1, Captain H. H. Paynter, 12-16-h.p. Wilson-Pilcher; 2, Mr. Slaney, 12-16-h.p. Wilson-Pilcher.

CLASS 8.—Capacity not exceeding 4 litres: 1, Mr. W. E. Galloway, 8-h.p. Stanley Steamer; 2, Mr. H. E. Galloway, 8-h.p. Stanley Steamer; 3, Mr. F. Turvey, 15-h.p. Darracq.

CLASS 9.—Capacity not exceeding 5 litres: 1, Mr. R. Rigbye, six-cylinder 30-40-h.p. Humber; 2, Mr. C. B. Grimshaw, 40-h.p. Napier.

CLASS 10.—Capacity not exceeding 6 litres: 1, Sanderson and Sanderson, 20-h.p. Daimler.

CLASS 11.—Capacity exceeding 6 litres: 1, Mr. G. S. Barwick, 30-h.p. Daimler; 2, Mr. A. E. George, 32-h.p. Siddeley; 3, Mr. E. W. Leather, 40-h.p. Fiat; 4, Mr. Rowland Hodge, 40-h.p. Delaunay-Belleville.

The fastest speed on the hill was made by Mr. G. S. Barwick's 30-h.p. Daimler, its time being 18.2.5 seconds better than the next

The Metallurgique 16-20-h.p. Landulet-Limousine recently supplied to Mr. Ernest de la Rue, of Lower Hare Park, Newmarket. The vehicle seats four inside comfortably, two fold-up seats being provided.

car in its class and 7.3-5 seconds better than the 5-h.p. Vindec Special bicycle which made the second best time on the hill.

The detailed results were as follows:—

Order on Time.	No. of Entri.	Class.	Rated H.P.	Calculated H.P.	Make.	Cylinders.	Entrant.	Seconds above fastest Time.	Handicap Marks.

The large number of spectators made the keeping of the course

a very difficult matter, but the committee were greatly helped by a staff of police under the charge of Superintendent Murphy, of Consett.

The two handicaps for motor-bicycles and cars respectively will be decided on formula, and the results made known during the course of the week.

**WENLOCK HILL.**—The Marchand car made its public debut in open competition in England on Saturday, at the open hill climb organised by the Wolverhampton Automobile Club at Much Wenlock. The Marchand entered by the Premier Motor Company was a 20-24-h.p. touring car, and was driven by Tamagni, making the fastest time of all competitors.

### ROAD REPORTS.

**ESSEX.**—A proposal before the Essex County Council that danger signals for motorists should be placed where required has been withdrawn. The total mileage of made roads in the county of Essex is 793.

**CUCKFIELD.**—The tarred road experiment at Cuckfield is proving a great success. The experimental portion has had two months' hard wear, with heavy motor and traction engine traffic. The cost works out at 1½d. a square yard, it is calculated to last a twelvemonth, and is found to be such a preservative of the road surface that a considerable period will be added to the life of a road without repair. The secret of

The Organisers of the Manchester Crippled Children's Outing. Messrs. W. Hyde, J.P., and Sawley Brown are in the Car; Messrs. C. B. Holmes (Hon. Treasurer) and William Cotsworth (Hon. Secretary) are standing.

the success of the Cuckfield experiment is a sound road, well swept of dust, and the tar applied hot, and covered with sand to prevent it lifting until thoroughly set.

**WESTMORLAND.**—An inquiry into the application of the Westmorland County Council to the Local Government Board for the issue of a regulation prohibiting the driving of motor-cars on the road known as Low Hill, Leasgill, in the parish of Heversham, was held on Wednesday.

**STIRLING.**—Mr. Alexander Stuart, the Commissioner appointed to hold a public inquiry into the application by the Stirling County Council for regulations under the Motor Car Act, has fixed Friday, July 20th, as the date of the inquiry, which will be held at the County Buildings, Stirling. The County Council aim at prohibiting the driving of motor-cars on certain roads in the county, and restricting the speed of motor-cars to ten miles per hour on certain other roads.

**NEW MALDEN.**—Lady Charles Beresford, having offered to defray the cost of laying dust-preventing material opposite her residence, Coombe Cottage, Mr. T. B. Simmonds, the surveyor, has been authorised by the district council to purchase a ton and a half of calcium chloride for the purpose.

### THE VANDERBILT CUP RACE.

THE 1906 Vanderbilt Cup race, which will take place on October 6th, promises to be an interesting event. Fifteen entries have been received for the American team, and an eliminating contest will be held on September 22nd. It is announced that France will be represented by Clement (Clement-Bayard), F. Shepherd or Le Blon (Hotchkiss), Heath (Panhard), Duray (De Dietrich), and Hemery (Darracq); Germany by Jenatzy, Mariaux, and Foxhall Keene, all driving Mercedes cars; Italy by Lancia, Nazzaro, and Weilchott on Fiats, and Cagno and Fabry on Italas, and England by two Napiers.

### MOTOR-CYCLE UNION.

THE second of the season's speed trials of the Dublin Centre Motor-Cycle Union took place on Saturday at Portmarnock.

The One Mile Novice Handicap was won by B. Dumphy, 2½-h.p. Minerva, 5 sec.

In the final heat of the One Mile Members' Handicap the order was:—H. Quinn, 3-h.p. Triumph, 1; D. O. B. Gill, 2-h.p. Minerva, 2; J. G. Drury, 3-h.p. Triumph, 3; B. Dumphy, 2½-h.p. Minerva, 4; C. G. H. Lewis, 2½-h.p. F.N., 5.

Only three competitors finished the Seven Miles Members' Handicap, viz.:—A. G. H. Lewis, 2½-h.p. F.N.; B. Dumphy, 2½-h.p. Minerva; H. Quinn, 3-h.p. Triumph.

The third reliability run of the Dublin centre of the Motor-Cycle Union of Ireland for the Canning Cup took place on Monday. The four who successfully got through the two former trials left Inchicore at 11.15 a.m. as follows:—W. H. Meredith, 2-h.p. Triumph; R. E. Price, 2½-h.p. F.N.; T. W. Murphy, 3-h.p. Singer; and H. Mooney, 2½-h.p. F.N. Meredith and Price scored equal marks.

### NEW COMPANY REGISTERED.

**ELSWORTH MOTOR COMPANY.**—This company has been registered with a capital of £5,000 to take over the business of a manufacturer of and dealer in motor-cars and lorries carried on by Mr. A. Elsworth, at Dudley Hill, Bradford.

### CHAUFFEUR'S APPEAL.

At the Surrey Quarter Sessions at Kingston, Thomas Carpenter, chauffeur to Mr. Sydney Van Den Bergh, appealed against a conviction and a sentence of a month's imprisonment in the second division for driving a motor-car on the highway at a speed dangerous to the public. Mr. Daldy, who appeared on behalf of the justices who tried the case, said defendant was travelling at the rate of 37½ miles an hour. Police-constable Knight, of the Surrey Constabulary, said he tried to stop the car and stepped into the road and held up his hand. The appellant stopped some distance away, but started again. Witness held up both hands and called out "Stop." The appellant still came on, however, and as he approached witness he shouted "Get out of the way, or I'll be over you." Witness jumped to the side just in time, or the car would certainly have knocked him down. Mr. George Elliott, who appeared for the appellant, said he admitted the speed, but he urged that the sentence of imprisonment should be mitigated. The Chairman said the magistrates were unanimous that it was a serious offence, and there was a strong feeling that the appeal should be dismissed and the sentence of imprisonment confirmed. But they were willing to make this alteration, that instead of imprisonment there should be a fine of £50, the appellant's licence to be suspended for one year.

### STONE THROWING AT MOTORISTS.

A BOY has been charged at Penarth with throwing stones to the danger of motorists. Mr. F. C. Shackell, solicitor, Cardiff, who prosecuted, said the lad was throwing at a motorist. The practice was becoming prevalent, and very few drivers escaped some sort of injury on this account. Defendant was fined 1s.

### AN APPEAL ALLOWED.

LAST week we briefly mentioned an appeal which came on for hearing at the Winchester Sessions on the 3rd inst. Thomas Tisington, a driver in the employ of the Isle of Wight Express Motor Syndicate, Ltd., was convicted before the Court of Summary Jurisdiction at Ryde, Isle of Wight, on the 12th day of June, 1906, for that he did on the 1st day of May last unlawfully use on a certain public highway a certain heavy motor-car not constructed on the principle of consuming its own smoke, contrary to the provisions of Section 30 of the Highways and Locomotives Amendment Act, 1878. The only evidence called for the prosecution was a police constable, who stated that he saw smoke emitting from the motor-car for about a minute. The defence was that the motor-omnibus, being constructed on the latest principle and to consume its own smoke, was by Section 1 of the Locomotives on Highways Act, 1896, taken out of the operation of Section 30 of the Locomotives on Highways (Amendment) Act, 1878. The grounds of appeal were

that the conviction was bad, being against the weight of evidence, and that no evidence was called by the complainant to prove that the omnibus was not constructed to consume its own smoke. Mr. E. B. Charles and Mr. H. J. H. Brodrick, instructed by Messrs. Amory-Parkes and Co., appeared for the appellant, and Dr. Emmanuel and Mr. Temple Cook appeared for the police. The appeal was supported by the Motor Union. After a somewhat lengthy argument the appeal was allowed, but without costs.

### CASES AGAINST MOTORISTS.

*[It must be understood that it would be impossible to report all the cases that are heard every week; we therefore endeavour to give only those which involve points of particular legal importance or of public interest.]*

IN inflicting a fine upon a well-known London motor trader at the Marylebone Police Court, the other day, Mr. Denman, the magistrate, remarked that at one time motor drivers complained bitterly that they were convicted of exceeding the limit on the mere opinion of the police

and also £1 4s. costs for not producing his licence when requested by the police. Dr. William Crowl, of Lower Berkeley Street, while he admitted travelling at thirty-two miles an hour, said he was motoring to Eastbourne to see a sister who was dangerously ill. Fined £4 and costs. Four other defendants were fined £4 each and costs; two others being mulcted in less severe fines for similar offences, viz., exceeding the legal limit.

AT Mortlake the Earl of Portarlington, of Emo Park, Queen's County, Ireland, has been fined £3 and costs for exceeding the speed limit of ten miles an hour in Richmond Park.

AT Derby William Paddon, of Beeston, was summoned for driving a motor-car at a speed exceeding twenty miles an hour at Sawley on the 11th June, also for driving at a speed dangerous to the public. Mr. Marcus Astle, J.P., of Draycott, said that about four o'clock on the day named he was passing through Long Eaton in his motor-car. As he came by Trent College he noticed another car coming up behind. Witness told his driver to increase the speed a little. This he did, but the other car came alongside his car, and he then looked at his speed indicator, which showed that his car was travelling at twenty miles an hour. The road at this point narrowed, and Mr. Astle told his man

Touring in Bohemia.—The Road, the River and the Rail.

*[Allgemeine Automobil Zeitung.]*

as to the speed at which they had travelled, and, as a result of the great influence they brought to bear, a clause was inserted in a Bill providing that they should not be summoned upon such evidence. The police were consequently provided with stop-watches, but still the motor-drivers were not content, and when it was shown by these watches that they had exceeded the limit, they asked that their own opinion should be accepted in preference to the scientific evidence of the watches.

ERNEST CHEAL, of Crawley, was summoned at Horsham for allowing a motor-car to stand for an unreasonable space of time unattended in the High Street, Ifield, on June 30th. P.S. Bristow said the car was left for twenty-five minutes in the centre of the main London road. There was much traffic at the time, and numbers of cars had to turn off their course owing to the obstruction. Defendant said there was ample space all round the car for the traffic. The car was in the centre of the Square, a very wide thoroughfare, and could not have been an obstruction. The case was dismissed on payment of costs, 5s.

AT the Oxted Police-court, on Tuesday, the Hon. Cyril Ward was one of the defendants summoned for motoring at Langham Cross-roads, Godstone, at thirty miles an hour. He was fined £4 and 13s. 6d. costs,

to pull up. As the defendant passed he shouted to him, but he took no notice. Witness and his man were completely smothered with the dust that the defendant's car caused. At the time the cars were abreast there was a man on the road, and had Mr. Astle's driver not pulled up this man would certainly have been knocked down and probably killed. The defendant admitted exceeding the speed limit, but denied that he was driving dangerously. He did not want to have the unpleasantness of the dust caused by Mr. Astle's car, and no doubt Mr. Astle did not want his. The end was that it was a neck-and-neck race. The Bench convicted the defendant for exceeding the speed limit, and Superintendent Avey then withdrew the other summons. A fine of £5 and costs was imposed.

MR. JUSTICE PHILLIMORE and Mr. Justice Relf have given their decision in the case of Constantine Mortimer, who was fined £10 at Barnet on a charge of exceeding the speed allowed for motors, and then taken to Pentonville Prison in default. Affidavits were put in showing that the magistrates ascertained that there were no goods on which to levy. The Court now found that the accused was in lawful custody, the conviction and warrant being right in form. It was intimated by counsel that the fine would now be paid.

### MOTOR-CAR ACCIDENTS.

THE Southwark coroner has held an inquest on James Mills, whose death resulted from injuries sustained through being run over by a motor-omnibus belonging to the Star Omnibus Company. A verdict of "Accidental death" was returned, and the driver was exonerated from blame.

A COLLISION occurred at the corner of Station Road and South Street, Bishop Stortford, between Dr. Hartley's car and another from West Ham. Both were damaged, but fortunately none of the occupants were injured.

EARLY on Saturday morning the motor mail van from Epping to Bishop Stortford skidded on the road at Harlow Common Hill. It struck a telegraph post and was considerably damaged.

MR. J. E. BUSH has held an inquest at the Sussex County Hospital, Brighton, touching the death of John Sames, which occurred at the institution. Alexander Staig stated that on the previous Sunday he was riding his bicycle from London to Brighton, and about twenty minutes to one he was passing through Bolney Cross, riding behind a motor-car going in the same direction. He had been hanging on to the car, but at the time of the accident he was pedalling up hill. Coming to a curve on the right hand side of the road to Brighton, he was about a yard behind the car. He saw the motor-cycle on which deceased was riding come round the corner. It caught him, and they both went down together, the motor-cyclist sustaining fatal injuries. After hearing evidence, the jury returned a verdict of "Accidental death."

BETWEEN seven and eight o'clock the other evening a small girl was knocked down at the corner of Southwark Bridge Road and Great Suffolk Street, S.E., by a motor fire engine and seriously injured.

### POLICE TRAPS.

TRAPPING is now so general on the southern roads that care must be constantly exercised.

CLITHEROE, in Lancashire, is now equipped with a police trap.

NEAR Oakham is the village of Great Casterton, with a trap in frequent operation.

FITZJOHN'S Avenue, Hampstead, is the scene of a police trap a furlong in length.

POLICE traps, three miles in length, have been established on the Wrexham Road, Chester.

POLICE traps at Washington, Southwick, and Kingston-by-Sea led to the appearance of six motorists at the Shoreham Sessions on Monday. Fines aggregating £35 and costs were inflicted.

### MOTOR-CAR ROBBERY.

AT the West Kent Quarter Sessions at Maidstone, John Campbell, an engineer, and John Rose, a fitter, both residing at Brixton, were indicted for breaking and entering a private garage at Beckenham and stealing a motor-car valued at £500, the property of Mr. Arthur Hordern, of Scott's Lane, Shortlands; and Robert Knights, a motor engineer, of Chelmsford, was indicted for feloniously receiving the chassis of the car, well knowing it to have been stolen. Campbell was sentenced to twelve months' hard labour, Rose to six months' hard labour, and Knights to three months in the second division.

### PUBLIC MOTOR SERVICES.

THE popularity of the motor-cars plying for hire between Stirling and Bridge of Allan has led to the licensing of two additional cars.

A RECOMMENDATION of the Works Council of the Willesden District Council asking the Commissioner of Police to take action against motor-buses racing in Edgware Road has been withdrawn on several members of the Council deprecating any interference at present.

A SERVICE of "Vanguard" motor-omnibuses is being started from Kensal Rise to Marble Arch and the City.

A MEETING of local residents interested in securing a motor-bus service between Fraserburgh and New Aberdour, N.B., has just been held, at which £600 was promised.

A RECOMMENDATION of the Brighton Watch Committee that motor-buses should be allowed to run along Marine Parade has been withdrawn at the invitation of the Council.

YEADON.—The result of the poll on the motor-bus question at Yeaton (Yorks) is as follows:—In favour of the District Council promoting a bill in Parliament to obtain powers to purchase and work motor-buses, 478; against, 902; majority against the proposal, 424. The papers returned numbered 1,499, of which 119 were blank.

MANCHESTER.—The Manchester Watch Committee has granted the Manchester District Motor Omnibus Company a licence to run through certain streets in the city, but the interests of the municipal tramway undertaking have been thoroughly safeguarded. In the southern suburbs the company has been less successful. Representatives of the authorities of Altrincham, Bowden and Hale, at a joint meeting, agreed to recommend their respective Councils to refuse licences in their districts. Alderley Edge is adopting the same course.

HALIFAX.—A deputation has been before the Halifax Tramways Committee to urge the provision of motor-buses or a better tram service

outside the town. In reply it was pointed out that the present power did not include such modern means of locomotion.

BRIGHTON.—The Brighton, Hove and Preston United Omnibus Company, Ltd., propose to extend as far as Worthing the route of the two motor-buses recently placed on the road between Kemp Town and Portlads.

### A TRAILER CASE.

At the Bromley (Kent) Petty Sessions, Clifton Shepherd, Carshalton, was summoned that he, being in charge of a motor vehicle with a trailer, did fail to carry upon the latter a person competent to apply the brake. He admitted the offence, and said he was ignorant of the law. Defendant was fined 20s. and 8s. costs.

### MOTOR-BUS ACCIDENT.

DR. DANFORD THOMAS last week, at Paddington, held an inquest on William Tongue, who died on the previous Friday in St. Mary's Hospital from injuries received by falling from a motor-omnibus in Edgware Road, W., on Wednesday. The Rev. Alfred Littlehales, of Wantage, was also severely injured and at present lies in St. Mary's Hospital in a serious condition. Henry Moore, a tailor, deposed that on Wednesday last, while in Edgware Road, he saw a Vanguard motor-omnibus coming towards him from Maida Vale at a pace of about seven or eight miles an hour, while close by there was a Pioneer motor-omnibus going in an opposite direction. They came into collision, and Tongue and another passenger were thrown into the roadway. Charles Stebbings, driver of the Vanguard motor-omnibus, said that he had to come well out into the roadway to avoid a water-cart. He had no knowledge that anything had happened until he was stopped. The Coroner: Did you know you had two passengers too many on the top and that they were not seated?—No. But you know now there was a collision and that two passengers were thrown from the top of the omnibus into the roadway?—Yes, but I did not know it at the time. The jury returned a verdict of accidental death. They censured the conductor for carrying more than the authorised number of passengers and recommended the company to raise the height of the back rail.

### ROUTES TO PARIS.

Now that the touring season is in full swing the following table of distances of the various routes to Paris may be of interest:—

HAVRE TO PARIS.			
Havre to Rouen	82 kilometres	51½ miles.	
Rouen to Mantes	79 "	49½ "	
Mantes to Paris	48 "	30 "	
	209 kilometres	130¾ miles.	
DIEPPE TO PARIS.			
Dieppe to Rouen	60 kilometres	37½ miles.	
Rouen to Mantes	79 "	49½ "	
Mantes to Paris	48 "	30 "	
	187 kilometres	117 miles.	
BOULOGNE TO PARIS.			
Boulogne to Abbeville	81 kilometres	50½ miles.	
Abbeville to Beauvais	85 "	53 "	
Beauvais to Paris	86 "	54 "	
	252 kilometres	157½ miles.	
CALAIS TO PARIS.			
Calais to Boulogne	33 kilometres	20½ miles.	
Boulogne to Abbeville	81 "	50½ "	
Abbeville to Beauvais	85 "	53 "	
Beauvais to Paris	86 "	54 "	
	285 kilometres	178 miles.	

### BRITISH IMPORTS OF FOREIGN MOTOR-CARS.

MONTH by month we publish the value of the imports of foreign motor-cars and parts into this country. It is only possible, however, to give the aggregate importation, no information being available as to the countries from whence the goods are shipped. We are now, however, able to give, in the appended table, these particulars as regards the imports during the past two years:—

	1905.			1904.		
	No. of Cars.	Value of Cars. £	Value of Parts. £	No. of Cars.	Value of Cars. £	Value of Parts. £
Germany	278	98,100	128,069	174	64,408	1,242
Holland	108	49,710	7,540	72	20,254	5,055
Belgium	573	293,242	67,881	433	201,115	19,272
France	4,093	1,859,807	711,987	4,112	1,655,969	304,788
United States	559	132,954	13,593	568	123,940	11,849
Other countries	11	4,689	51	19	4,685	1,363
Totals	5,622	2,438,002	929,131	5,378	2,080,371	343,569
Total imports of cars and parts		£3,367,123			£2,423,940

## COMMENTS.

**M**OTORISTS are assembling in the ancient city of Bath to-day (Saturday), and Sir A. Acland Hood, Bart., M.P., a vice-president of the Motor Union, as well as one of the leading public men of the county of Somersetshire, will preside at the dinner of the largest automobile organisation in the country. We have already outlined the programme of the proceedings, and drawn attention to some of the prominent features of locomotion in that city; motorists may, however, be interested to know of the opportunity they will have of seeing the preserved remains of the Roman baths to which the town owes its foundation and celebrity. Its literary associations are equally notable, and in St. James's Square is the house where Dickens, Forster, Maclise and Southey received the hospitality of Landor. Burke, Chesterfield, Mrs. Thrale, Mrs. Siddons, Southey and Byron are other names associated with this classic city. With the aid of their cars the motorists will be able to visit Cheddar, with its wonderful cliffs, the cathedral city of Wells, Clifton, with its Suspension Bridge, and the delightful resort of Clevedon, with its memories of the friend of Tennyson—Arthur Hallam—while Corsham Court and Bowood will be within distance, as well as the Marquis of Bath's seat at Longleat, where the hill-climbing contest will take place.

### At Last.

Two mournful utterances with regard to the future of the horse have been heard this week—both from experts whose pessimistic views are entitled to recognition. In the House of Lords the Duke of Portland took part in a discussion on Horse Breeding, and alluded to what he regarded as a fact, viz., the disastrous effect which the coming of the motor-car had had on horse breeding generally. As chairman of the Royal Veterinary College, Sir Nigel Kingscote has spoken in an equally dolorous vein, regretting that fewer young men were coming forward as students. They were, he said, turning their attention to motor engineering—a wise course on their part.

### Municipal Work.

Few men have had such practical experience of motor vehicles for municipal work as Mr. J. A. Brodie, the City Engineer of Liverpool, whose paper on the subject at the recent annual meeting of the Incorporated Association of Municipal and County Engineers in London was a notable contribution to the literature of the subject. He rightly emphasised the value of the trials which were held in Liverpool in 1898 and the succeeding years, and also of the enterprise of the Corporation of that city in being the first to adopt motor vehicles. That was a 4-ton steam vehicle which won the gold medal. It was delivered to Mr. Brodie's department in January, 1899, and is still—after an interval of seven years—at work. This should be a reply to the Cardiff people, whose experience with motor vehicles does not seem to have been an inexpensive one. Summing up his experience, Mr. Brodie believes that the medium-weight petrol wagon on rubber-tyred wheels and the

light tractor will be found specially serviceable. The three automobile fire engines in use in his city have proved their economy, one machine taking the place of three vehicles and three pairs of horses. In concluding his paper, the City engineer of Liverpool urged younger members of the Association to acquire a practical knowledge of the motor-car wherever possible, as without that it will be difficult for those responsible for the maintenance of the roads to thoroughly understand the modifications which the automobile requires in connection with road surfaces.

### The Brighton Road.

MANY volumes have been written on the Brighton road, and its legends and history are familiar to most southerners who journey thereon. Mr. C. G. Harper's new book on the subject, however, fills a niche of its own—albeit only a small one, no larger than the waistcoat pocket for which it is intended. The dimensions of the book are  $2\frac{1}{4}$  by  $3\frac{1}{4}$  by  $\frac{1}{8}$  inch. There are more than 300 pages, some nicely illustrated, others well written, descriptive of the scenes on the way. Interesting glimpses of history occur here and there, such as the story of Reigate and the Parcel Post service. In 1883 Parliament and the Post Office made an agreement with the railway companies to give them 55 per cent. of the postage for their share of the carrying. For four years the London and Brighton Parcel Post was conveyed by rail, and then a four-horsed van was put on the road in June, 1887. A steam motor-van was used as an experiment in the winter of 1897-8 between London and Redhill, to relieve the Brighton mail. That was shortly afterwards discontinued, and it was not till June of last year that the horsed mail performed its last journey, being superseded by the petrol motor mail van. Extended reference is made by Mr. Harper to Hand Cross—a settlement of forty or fifty houses situated where several roads meet. The hamlet is within the extensive Slaugham parish and derives its position from the fact that it is on the junction of several routes. The "Red Lion" is of greater attraction than all other buildings at Hand Cross, and has assumed a melancholy interest owing to the recent motor-bus accident. It stood there in receipt of coaching custom through all the roystering days of the Regency as it stands now, prosperous at the hands of another age of wheels. This miniature book on the Brighton road has an excellent map, and is published by Messrs. Anthony, Treherne and Co., Ltd.

### The Motor-Bus Accident.

THE accident which happened near Handcross on Thursday of last week was the most serious disaster that has yet occurred in connection with automobilism, and suggests a doubt as to whether motor-buses should, in the present stage of development, be utilised for journeys in country districts where roads of an undulating character have to be encountered. A Vanguard bus had been hired for the day by a party of tradesmen from Orpington and St. Mary Cray for a run to Brighton. There were thirty-six passengers, including the driver and conductor, and all went well until arriving at the hill at Handcross. When the greater decline was reached, or, perhaps, just before, the driver is said to have put his foot on

the brake, but found that it would not act. The omnibus gained considerably in speed, and he endeavoured to put in the reverse. The whole mechanism seems, however, to have been thrown out of order. An old oak tree on the right-hand side was struck, and the roof over the driver and the projecting part on that side were torn away. The car bounded to the other side of the road, and then, with a crash, rebounded. Nine of the passengers were killed outright, one has since died, and twenty-six were injured.

#### "Motor-Bus Perils."

THE accident has given the cue to the lay Press to take up the subject of "Motor-bus perils," and during the last few days considerable space has been devoted to the subject, and especially to letters from various correspondents airing their different grievances. In fact, quite an outcry has sprung up against these vehicles, the charges ranging from their noise and dangerous speed to their effect on the value of property. Even in Parliament the accident has been the cause of bringing the motor-bus into discussion, Sir E. Sassoon having inquired whether the Home Secretary had considered the expediency, in the interests of public safety, of suspending all existing licences for motor-buses pending the establishment of a more rigid and effectual system of inspection than that which now obtained of the brakes and other safety appliances. Mr. Gladstone (the Home Secretary) in replying, declined to suspend the issue of

The 18-22-h.p. Sanderson-Aster Landaulet supplied to Dr. Drummond, of Newcastle-on-Tyne.

licences, he stating that there was no evidence to prove that the recent accident was attributable to defective or unsuitable brakes or steering gear. He, however, assured the House that the whole question of motor-buses is receiving most serious attention, both on the part of the police authorities and the President of the Local Government Board. The views of Sir Edward R. Henry, the Commissioner of the Metropolitan Police, on the matter have also been made known by the publication of a letter written under his direction by Mr. G. H. Edwards to the Kensington Borough Council, in which it is pointed out "that the regulations he has prepared provide against undue noise and vibration, though it may prove difficult to fix a standard of what shall or shall not be deemed undue noise or vibration. Many omnibuses offending in this respect have been warned off the streets, and similar action might have been taken against many more, had he not realised that some latitude should be allowed, as this industry, in which a large amount of capital has been invested, and which no doubt meets a public requirement, is still in an imperfect stage of its development." Finally, the Commissioner has issued a letter or manifesto to the omnibus companies which have motor-buses plying in the streets. He points out to them that "complaints are now received daily that the maximum speed limit is habitually exceeded, that drivers over-lubricate, regardless of the grave inconvenience caused to

other users of the streets by the noxious fumes resulting from this cause. That there is much justification for these complaints the Commissioner is bound to admit, and he feels that the weight of public opinion now requires that he should exercise more stringently his powers of control over public carriages. He trusts, therefore, that you will see that all necessary steps are taken as the need arises to remedy such defects as those described in the omnibuses belonging to your association, since it would be with much regret that the Commissioner would find himself compelled to intervene." The outcry that has arisen—not so much against the motor-bus in itself as against certain undesirable features they have brought in their train—is a serious one, and it behoves those interested both in their construction and operation to take prompt measures to abate the nuisances complained of, otherwise we are afraid that restrictions and limitations will be introduced that may seriously interfere with the development of motor traffic in the future.

#### The Cause of the Accident.

VARIOUS theories have been advanced as to the cause of the Handcross accident, but the one that is receiving most credence is that "the cardan shaft broke, and after that all the transmission went to pieces." The vehicle was one of the ordinary Vanguard double-deck buses, as used on the various routes in the Metropolis; the chassis is of the Milnes-Daimler type, in which the power is conveyed from the gear-box through a universally-jointed or cardan shaft and bevel gearing to a differential shaft parallel to and slightly forward of the rear axle. On the ends of the differential shaft are fixed small spur wheels, which mesh with internally-cut toothed rings bolted to the rear road wheels. In view of the tendency of the passengers to crowd on the top, consequently increasing the difficulty of steering, especially down hill, owing to the great momentum, we do not consider double-deck buses—of whatever make be the chassis—suitable for the conveyance of picnic parties on country roads. We are, however, in this particular case, inclined to agree with the view that the broken cardan shaft was the primary cause of the accident, especially having regard to the fact that, although a failure of this portion of the transmission is not a common occurrence, it has been experienced before, one occasion being, strangely enough, directly in front of the offices of the *M.C.J.* The accident is by far the worst which has taken place in this country since the Motor Car Emancipation Act came into force, and it is to be hoped that its very serious consequences will cause all motor-omnibus builders, both at home and abroad, to closely review their designs, with the view of preventing any recurrence of the melancholy event. The matter of transmission in particular is certainly one that requires attention, there being many who hold the opinion that the chain drive is much more reliable for bus work than the cardan shaft system.

#### Better Late than Never.

WE learn that the Norfolk County Council Technical Instruction Committee have commenced an interesting experiment. A van has been equipped with farriery appliances, and it will pass from village to village, accompanied by a lecturer, who will give demonstrations in horse-shoeing. The practical operations will be varied with lectures on the structure of the horse's hoof and on other subjects incidental to farriery. To be really up-to-date a motor-van should be employed on this somewhat antiquated kind of mission.

#### The Saltburn Meet.

ELSEWHERE we refer to the racing on the sands at Saltburn, organised by the Yorkshire Automobile Club. A change which took place in the programme seems to need some explanation. Last year the proprietors of the "Sheffield Telegraph" offered to the Yorkshire A.C. a silver cup of the value of £50 for competition at the Filey speed trials, in a competition

which should be open to every make and kind of touring car irrespective of the method of propulsion, whether steam, petrol, or electricity. The trophy was accepted, and with it, presumably, the conditions. The Filey meet found no such class as had been stipulated, and the "Sheffield Telegraph" trophy was placed in one from which steam cars were definitely barred. This neglect on the part of the club to observe the stipulated conditions was the cause of correspondence. It was anticipated that in this year's meet no such oversight would obtain. Nevertheless, exactly the same difficulty has arisen, the conditions governing the trophy were ignored, and it was found necessary to withdraw the cup. In consequence of the protests lodged by the proprietors of the "Sheffield Telegraph," Mr. Hepper, chairman of the Yorkshire Automobile Club, went to Sheffield some little time ago, and was then informed that there was no desire to upset the arrangements which had been made for Saturday's meeting, but it was desirable that a guarantee should be forthcoming that for next

propelled, and it was their repeated disinclination to carry out those conditions which resulted in the substitution of another trophy at Saturday's meet.

"If at First,"  
etc.

BRUCE's tenacity of purpose seems to have been demonstrated at the last meeting of the District Council of Caerleon. Upon that illustrious authority are men who do not regard the motor-car with fervour or favour. They sought to apply for a limitation of the speed of cars passing through the place to seven miles per hour—two miles above the limit suggested by the Plymouth people in a recent issue. But the clerk was wiser than the Council, and he advised them not to adopt any resolution of that kind. They displayed a certain amount of reason in giving heed to such good words, but then a Mr. Williams proposed that a new road be constructed to divert the motor traffic from the main street. But that was not likely

Photo by

The "Henry Edmunds" Trophy. Mr. Paul Brodtmann starting on his 30-40-h.p. Daimler.

[Argent Archer.

year and years to come the original conditions should be respected. On his return home Mr. Hepper wrote stating that, as chairman of the club, he was quite unable to give any such guarantee as had been requested, and that, if it was insisted upon, the club would have no option but to return the trophy to the donors.

#### The Steam Car in Competition.

MR. C. D. LENG, the editor of our Sheffield contemporary, is an enthusiastic motorist, owning both steam and petrol cars, and he will probably offer the cup to some other automobile club willing to comply with his suggestion of a contest open to steam or petrol vehicles. Certainly it seems difficult to understand why, having accepted the trophy, the Yorkshire Club did not comply with the conditions imposed by the donor. It was the expressed wish that the "Sheffield Telegraph" cup should be competed for by any kind and make of car, however

to have the approval of the economist—it was defeated. Others threaten that the last has not been heard of the matter, and so strong are their words that we advise motorists going that way to proceed at a tortoise-like pace.

#### Vindictive Folly.

THE idea of mulcting motorists in heavy fines for merely driving upon the road excels in vindictive folly the convictions that are so frequently taking place on southern roads. After travelling at an alleged speed of, say, twenty-five miles an hour, motorists may well complain of the law's harsh exactions; but to suggest that no motor-car is to be upon the road at all until its owner has paid £20 to the revenue is a piece of fatuous nonsense, scarcely worthy even of the first degree in local government, and certainly not in accord with the high tribute paid by Mr. Chamberlain recently to those who are our rulers and administrators in parochial and municipal

matters. By the way, Mr. Chamberlain, whose dislike of exercise seems to be a characteristic feature, enjoyed his motor trip on his seventieth birthday, and it was appropriate that no fewer than eighty motor-cars should have followed his course through the city of his adoption.

#### A Tax of £20.

SEEING that the first provincial meet of the Automobile Club was to Chester, we had hoped the motor education of the city and district was fairly complete. But there are localities in Cheshire that have yet to be trained to an appreciation of the automobile, and the wayward suggestions of certain authorities therein serve to indicate the need that exists for further propaganda efforts. A large number of cars journey through Chester every day, and 500 were counted passing through one of the suburbs, Tarvin, a Sunday or two ago. Hence the complaints that arose at the Tarvin Rural District Council on Saturday when the chairman thought the chief cause of the dust was owing to the body of the motor-cars being so low. If they were raised three feet there would not be one half the dust. The surveyor suggested a tax of £10 for each indicated horsepower on a car, and a petition was read suggesting that the support of local members of Parliament should be sought to deal with the problem, when a member of the Council exclaimed: "It is no use asking their support, they are all motorists." Ultimately it was decided to support a petition from Hawarden, which recommended, among other things, that the tax should be £20 per car and the maximum speed twelve miles an hour.

#### For Ex-Soldiers.

As was anticipated by us last week, the report of the committee appointed to consider the best means of aiding soldiers and sailors on their discharge from the King's service to obtain civil employment makes mention of motor driving as one of the avenues of employment. This is specifically mentioned by Sir Edward Ward's Committee as one of the vocations in which he should be trained during the period of military service. Some part of the expense of instruction should be borne, the Committee propose, by the men themselves; but in each command an adequate sum should be placed at the disposal of the officers of the regiment to defray the cost so far as might be required. It is noted that in some branches of the service a beginning has already been made. At Eastney Barracks instruction is given to marines and soldiers in motor-driving, farriery, electric wiring, and one or two other subjects. The course is optional at present, but it is proposed to make it obligatory. Steps have also been taken by the Coldstream Guards, the Ordnance College, and the School of Mechanical Transport at Aldershot to form classes. The system, however, should be introduced, the Committee hold, throughout the Army. As for the possible reluctance of the British soldier to perceive its advantages, it is suggested that lecturers should be engaged to visit each military centre two or three times a year, with a view to bringing clearly before the men, by popular and descriptive methods, the possibilities of a future career in civil life. In the case of the motor-car, little incitement of this kind will probably be needed.

#### Dust as Insecticide.

UNDER the troubles and opposition they have to bear motorists might be excused a vein of pessimism. It is gratifying, however, to find encouragement in news that comes from Somersetshire—in which county the next provincial meeting of the Motor Union will be held. Farmers in the apple-growing districts of Somersetshire, famous for its cider, have noticed a remarkable freedom from blight in orchards bordering the high roads. Investigation has shown that this immunity is due to the action of dust raised by passing vehicles, that of motor-cars having naturally the greatest range. The dust has a destructive effect precisely analogous to that of insect powder.

## RACING AT SALTBURN.

MOTOR racing on the sands is popular at Portmarnock, and has succeeded at Skegness. But for the curiosity of the crowd it would have been possible at Filey last year; had there been sufficient entries the motorists of the Fen country would have raced along the sands at Mablethorpe to-day (Saturday). So far, however, Saltburn has provided the most suitable stretch of sands for such sport, so far as this country is concerned, and as the course remained firm throughout the race meeting last Saturday, a really fine afternoon's racing was witnessed by the crowds who journeyed thither from all parts of East Cleveland, as well as elsewhere. More than 200 motor-cars entered the town on the 13th inst., and estimates of the number of visitors present on Saturday vary from 30,000 to 40,000.

The event was organised by the Yorkshire Automobile Club, with the assistance of the Marquis of Zetland, who is lord of the manor, and the local authorities, who rejoiced to find that the crowd that was attracted proved a record in the annals of the pretty little town on the coast. To keep the course clear Major Bower, the Chief Constable of the North Riding, drafted 120 officers and men into Saltburn, and the organisation was as nearly perfect in that respect as could be.

Mr. C. P. Wilson, of Leeds, was the hon. secretary for the meeting and also clerk of the scales; and the chief officials were as follows:—Judges, Messrs. J. Constantine, W. Penrose-Green, E. Gordon Learoyd, G. Scoby-Smith, Dr. Crossley Wright; marshal-in-chief, Mr. E. H. Hepper; assistant-marshals, Messrs. A. Exley, L. Hey, A. W. Dougill, E. Faiers, H. A. Jones, A. E. Masser, H. Tomlinson; timekeepers, Messrs. A. Fattorini, J. Hyland, J. E. Rhodes, J. A. Walker; and starter, Mr. J. Brogden. The handicapping was performed by the Committee of the Yorkshire Club, who also acted as clerks of the course, in conjunction with the Saltburn committee.

Acting wisely, the committee arranged that the small cars were to run up, and thus the crowd was gradually prepared for the flights of speeds with which they were regaled later in the day. The results are appended:—

Event A.—A closed competition for "Whiteman" trophy for single-cylinder touring cars up to 6-h.p., carrying two passengers; above 6-h.p., carrying four passengers. Not to exceed 8-h.p.

Heat 1: 1, Guy Barrett, 6-h.p. De Dion; 2, A. L. Rhodes, 6-h.p. De Dion; 3, W. Ashford, 8-h.p. Cadillac; 4, W. W. Stainthorpe, 6-h.p. De Dion. Heat 2: 1, Alf. Masser, 6-h.p. De Dion; 2, F. Burr, 8-h.p. Darracq; 3, W. Robertshaw, 8-h.p. Cadillac.

Final: 1, Guy Barrett, 6-h.p. De Dion; 2, Alf. Masser, 6-h.p. De Dion. Masser, the holder, was easily defeated.

Event B.—A closed competition for cars up to 12-h.p. Heat 1: 1, A. Rawlinson, 10-h.p. Darracq; 2, S. Downing, 10-h.p. Alldays; 3, F. Burr, 10-h.p. Humber. Heat 2: 1, T. H. Woollen, 10-h.p. Clement-Talbot; 2, C. McAdams, 10-h.p. Humber; 3, Alf. Masser, 10-h.p. Mass; 4, R. Winn, 10-h.p. Humber. Heat 3: 1, J. Hepworth, 12-h.p. Clement-Talbot; 2, F. Churchill, 12-h.p. Hallamshire; 3, Miss L. B. Starkey, 12-h.p. Arroll.

Final: 1, T. H. Woollen, 12-h.p. Clement-Talbot; 2, J. Hepworth, 12-h.p. Clement-Talbot; 3, A. Rawlinson, 10-h.p. Darracq. The drivers of the three winning cars were Messrs. G. Day, J. Mortimer and S. Girling respectively.

Event C was the Rowland Winn Cup, and was a closed competition for touring cars up to 16-h.p. Heat 1: 1, C. Leather, 16-h.p. Humber; 2, P. Fawcett, 16-h.p. Fraschini; 3, T. Mitchell, 15-h.p. Panhard. Heat 2: 1, N. F. Bayliss, 16-h.p. Sunbeam; 2, C. McAdams, 10-h.p. Humber. Heat 3: 1, R. Winn, 16-h.p. Humber; 2, A. Huntley-Walker, 15-h.p. Darracq. Heat 4: 1, P. Graham, 16-h.p. Humber; 2, F. Burr, 16-h.p. Humber; 3, A. Elsworth, 14-h.p. Spyker.

Final: 1, R. Winn, 16-h.p. Humber; 2, P. Graham, 16-h.p. Rover; 3, C. Leather, 16-h.p. Humber; 4, N. F. Bayliss, 10-h.p. Sunbeam. The previous holder of the trophy was Mr. A. Huntley-Walker.

Event D was for cars up to 24-h.p., and was divided into two classes, those up to 12-h.p. being put into the first division, and the winners meeting on handicap terms. There were three heats in each section, the semi-finals finishing as follows:—Up to 12-h.p.: 1, T. H. Woollen, 12-h.p. Clement-Talbot; 2, J. Hepworth, 12-h.p. Clement-Talbot; 3, A. Masser, 10-h.p. Mass. Up to 24-h.p.: 1, E. H. Leather, 24-h.p. Fiat; 2, S. S. Dixon, 20-h.p. Darracq; 3, W. R. Ledgard, 24-h.p. Mass. The final proved a hard tussle between the Fiat and Clement-Talbot, the former winning by eighty yards.

Event E, for cars up to 30-h.p., was for the H. R. Kirk Trophy, which Mr. A. Farnell had previously won twice in succession, and of which he now secured possession on his 30-h.p. Daimler, which beat Mr. W. J. Wright's 30-h.p. Darracq.

Event F was open only to members of the Cleveland branch of the Yorkshire A.C. The result was:—1, G. Scoby-Smith, 16-h.p. Humber; 2, W. S. Dickie, 10-h.p. Humber; 3, F. T. Shaw, 10-h.p. Talbot.

Event G, a closed competition for touring cars carrying full complement of passengers, the chassis price of which does not exceed £350, brought a field of seven cars, the final result being:—1, P. Graham, 16-h.p. Rover; 2, C. Wade, 16-h.p. Rover; 3, A. Masser, 10-h.p. Mass.

Event H was for cars costing not more than £600, and produced nine starters, the final three being:—1, W. J. Wright, 30-h.p. Darracq; 2, S. S. Dixon, 20-h.p. Darracq; 3, P. Graham, 16-h.p. Rover.

Event I, for steam cars, lacked excitement, but Mr. W. Ashford, on his 14-h.p. Stanley, attained a speed equal to 54 m.p.h., and was awarded a gold medal.

Event J, for touring cars not exceeding £800, resulted in a battle royal between Mr. A. Farnell, on his 30-h.p. Daimler, and Mr. C. Sangster, on his 30-h.p. Ariel, that being the final order of performance.

Steadily had the excitement grown throughout the day, the racing becoming faster with each event, and the crowd, with the Yorkshireman's love of sport, eagerly anticipated the final event for racing cars for the Saltburn Trophy. The course was over a distance of one kilometre, as were all the previous events, and each car was allowed three runs with a flying start. There were three entries:—Mr. W. J. Wright's 100-h.p. Darracq, driven by the entrant; Mr. Charles Jarrott's 100-h.p. De Dietrich, driven by W. Sorel; and Mr. W. J. Masser's 70-h.p. Mass.

The times of the cars were as follows:—

- 1.—W. J. Wright, 100-h.p. Darracq, 23 1-5 sec.
- 2.—W. Sorel, 100-h.p. De Dietrich, 24 3-5 sec.
- 3.—W. J. Masser, 70-h.p. Mass, 36 sec.

## THE OSTEND AUTOMOBILE MEETING.

THE annual automobile meeting at Ostend opened on the 13th inst. with the weighing-in of the competing vehicles and an elegance contest, a noteworthy feature being the presence of several English competitors. Saturday the 14th inst. was devoted to a series of speed trials for racers and tourists, the flying kilometre taking place in the morning and the standing mile tests in the afternoon on the Snaeskerke-Ostend road. The honours of the day fell to Mr. Lee Guinness, who, on the 200-h.p. eight-cylinder Darracq he recently purchased, established a new world's record for the flying kilometre, covering the distance in 19 sec., equal to a speed of no less than 118.3 miles per hour. The previous record, 20  $\frac{2}{3}$  sec., was made by Hemery on the same car on the Arles-Salon road, in France, on December 30th last. Mr. Guinness's time for the standing mile was 45  $\frac{2}{3}$  sec. In the light racer category, Mr. Huntley Walker on a 100-h.p. Darracq covered the flying kilometre in 26  $\frac{2}{3}$  sec. (equal to 85.3 miles per hour), and the standing mile in 1 min. 35  $\frac{1}{3}$  sec. The touring cars were classified on a price basis, the best two results in each section being as follows:—

Class.	Name.	Car.	Time.	Average speed in miles per hour.
Under £230	1. Cayzele ..	Sizaire-Naudin ..	56 2-5 sec. ..	39.8
£230 to £280	2. Evenopol ..	Pope-Toledo ..	1 min. 11 1-5 sec. ..	31.7
£280 to £360	1. Perpero ..	Germain Chainless ..	40 1-5 sec. ..	55.9
£360	2. Servais ..	Germain Chainless ..	40 2-5 sec. ..	55.8

View of Starting Point.

The 100-h.p. De Dietrich driven by M. Sorel at full speed.

### RACING ON THE SANDS AT SALTBURN.

There is no reason why the Saltburn meeting should not become an annual event, the sands being so well adapted for the purpose of motor racing. The town is a modern residential watering place, with pure air and beautiful surroundings. The view from Saltburn towards Huntcliffe Sear and to Loftus is made interesting by the richly-wooded spurs of the Cleveland hills, while looking southward is Skelton village, with the Castle that is said to be the oldest inhabited house in England. The gardens of Saltburn are, however, its natural charm, these being situated in the glen of Skelton Burn; a recess so sheltered that vegetation flourishes with almost tropical luxuriance. All these things considered, and with sands so well adapted for the purpose, lead to the hope that the Saltburn meet may become an annual fixture of the Yorkshire Automobile Club.

THE Coventry Chain Company, Ltd., have issued a new catalogue of their motor chains, in which an illustrated account of their manufacture is a prominent feature. Hints on the manipulation of chains and on chain lubrication are given, and a list of sizes and their suitability for various types of cars is an interesting section.

£360 to £480	1. Sabbe ..	Minerva ..	43 2-5 sec. ..	52.4
£480 to £600	2. Wilford ..	Minerva ..	45 3-5 sec. ..	49.3
£600 to £800	1. Huntley Walker ..	Darracq ..	36 2-5 sec. ..	61.8
£800 to £900	2. Pilette ..	Pipe ..	43 4-5 sec. ..	51.3
£900 to £1,000	1. Gaste ..	Radia ..	36 4-5 sec. ..	61
£1,000 to £1,500	2. Macar ..	Rochet-Schneider ..	39 2-5 sec. ..	57.1
Over £1,500	1. Kloet ..	Pipe ..	33 1-5 sec. ..	67.7
	2. Wilhelm ..	Metallurgique ..	37 2-5 sec. ..	67.3
	1. Jochems ..	Mercedes ..	34 sec. ..	66.1
	2. Grigg ..	Daimler ..	36 2-5 sec. ..	61.8

In the standing mile trials for touring cars the best time was made by Grigg (Daimler), his time being 1 min. 9 4-5 sec.

An excursion to Bruges formed the programme on Sunday, while Monday was devoted to a series of five kilometre speed trials from a standing start on the Nieuport-Snaeskerke road for both racers and tourists. Mr. Lee Guinness again made the best time of the day, he covering the five kilometres on his 200-h.p. Darracq in 2 min. 6 4-5 sec. (equal to 87  $\frac{1}{2}$  miles per hour), as against 2 min. 24 3-5 sec. by M. Laverigne on a Mors. In the touring section M. Perpero, on a Germain Chainless, made the best time (3 min. 29 1-5 sec.) in the under £360 class, Mr. Huntley Walker's Darracq (3 min. 22 1-5 sec.) in the under £600 category, and Baron de Caters' Itala (2 min. 58 3-5 sec.) in the over £1,000 class.

## SOME CURRENT TOPICS.

### The Horse Power of Motor-Cars.

One of the most burning topics of the hour in automobile circles is that of the great variation in the horse-power ratings of the petrol motors of different manufacturers. For many years past the *M.C.J.* has frequently brought the subject forward, with the idea of arriving at some uniform basis on which to estimate the horse-power of different engines, but so far it has been impossible to discover a method acceptable to all makers;

M. Ramoisy on the 14-22-h.p. Germain Chainless Car he drove in the Aston Hill Climb. (See page 456.)

while from more than one quarter we received hints that it were best to leave the matter alone, and to let the question work out its own salvation. Far from this having proved to be the case, the variations in the different makers' estimates would seem to be growing wider and wider. In fact, the practice of rating one motor as of 20-h.p. while another of the same dimensions, and designed to run under practically the same conditions as regards speed, compression, and other factors, is credited with 24-h.p., has come to be so prevalent that motorists have begun to place little or no reliance on any catalogue figures with regard to petrol engine horse power. The somewhat paradoxical results of the recent hill-climbing competitions have once again brought the matter to the front, and although various suggestions are being made to arrive at a solution of the problem, it remains to be seen whether any definite result will be arrived at, especially in view of the many different methods of determining horse power which are being brought forward.

### A German Solution.

In connection with this matter it may be useful to refer to a solution which is being adopted in Germany. The new system of taxes on motor-cars in that country is based on a scale which varies in accordance with the horse power of the vehicle, and in order to decide on a uniform method of ascertaining this the Verein Deutscher Motorfahrzeug Industrieller or German Motor Manufacturers Union lately held a meeting, at which the representatives of about thirty motor-car builders, including all the leading firms in the country, were present. After much deliberation a formula was agreed upon and adopted by which the horse-power developed, not by the engine, but at the road wheels of the car, could be uniformly estimated. The formula is as follows:—

$$N = 0.3 \times i \times d^2 \times s,$$

where  $N$  = horse power,  $i$  the number of cylinders,  $d$  the diameter of the cylinder in centimetres, and  $s$  the stroke in metres. The mixing up of centimetres and metres is, in our opinion, rather confusing, and we consider an improvement would be effected if the formula were altered to

$$N = \frac{3 \times i \times d^2 \times s}{10000}$$

in which the letters have the same value as in the first formula with the exception of  $s$ , which, like  $d$ , now represents centimetres.

### Opinions Invited.

In arriving at this solution the German manufacturers have worked on the basis of a piston pressure of 3.8 kilogs. per sq. centimetre, equal to 54 lbs. per sq. inch, and a normal engine speed of 900 revs. per min. The formula has been submitted to the German Treasury authorities, and is, we hear, likely to be adopted as the standard for the whole of Germany. The figures obtained from it represent, as we have pointed out, the power developed at the road wheels of the car, and are naturally considerably less than those given as the capacity of the engine. No doubt opinions will differ as to the value of the German formula, because, for one reason, it presumes an equality of efficiency for the different systems of transmission; but, as it is the first serious attempt to introduce some degree of uniformity in the horse-power rating of petrol cars, it is worthy of the serious consideration of British manufacturers, whose views on the same we shall be glad to receive.

### Driving on the Brake.

Of the many letters that have appeared in the daily press during the past week with regard to motor-bus traffic, one of the best is that from Mr. H. M. Hobson, of the firm of that name which holds the British agency for Decauville cars. This gentleman considers, and we think rightly so, that "The cause of many accidents to motor-vehicles lies in the fact of drivers placing too much reliance on their brakes. I do not think," adds Mr. Hobson, "I have ever seen the driver of a motor-omnibus reduce his speed without the application of either his foot or side brakes, and the speed at which they rush into traffic, relying solely on the efficiency of their brakes, is nothing short of criminal." Everyone who has closely watched or even

The 115-h.p. Siddeley Car which took part in the recent Cottage Hospital Demonstration at Bexley Heath. The car was the chief feature in the procession, and was admired by everyone.

travelled on the vehicles cannot help having been struck with the same thought, and a little reflection will show that, apart from the danger involved, the wear and tear on the mechanism is greatly increased and the life of the buses correspondingly reduced. With the view of bringing about a reform in this respect, Mr. Hobson suggests that "Several road-inspectors with a long experience should be appointed, and when they see the drivers using their cars improperly—more especially I refer to rushing into traffic and hastily applying the brakes—they should report them, and, upon repetition of the offence, have them discharged."

THE Daimler Motor Company have recently received orders for cars from Lord Norfolk and Lord Scarsdale.

At the Lincolnshire Agricultural Society's show at Gainsborough this week a piece of ground was made available for the garage of motor-cars belonging to members of the county automobile club.

THE Town Council of Paisley is applying for a ten-mile limit for motor-cars passing through the town.

MESSRS. CROSSLEY AND PARRY, who have premises at 68, George Street, Oldham, have established a motor garage at Jackson Pit, in the same town.

ON Sunday a party of the chief sub-editors of the London newspapers visited Bisley camp, making the journey from town in a score of motor-cars placed at their disposal by various owners through the Automobile Club.

MESSRS. ALFRED HERBERT, LTD., of Coventry, have issued a catalogue of their machine tools in the Italian language for distribution at the Milan Exhibition. They also send a copy of the second edition of their 1906 catalogue of modern capstan lathes and other standard tools.

THE office staff and heads of the department of the new Arrol-Johnston Car Company, Ltd., of Underwood, Paisley, held their annual picnic on the 7th inst., when about eighty ladies and gentlemen motored by Greenock, Inverkip, Largs, and Lochwinnoch to Kilmalcolm, where lunch was served, and

## HERE AND THERE.

It has been resolved to wind up the Kandy (Ceylon) Motor Syndicate at an early date, as the concern is not paying and the expenses are heavy.

New by-laws for regulating the public traffic at Durban,

Natal, provide that the speed of motor-cars within the borough shall not exceed twelve miles an hour, and empower the police to arrest any offender.

AN order has been placed by Lord Newlands with the Daimler Motor Company for one of their 30-h.p. cars fitted with a limousine body of the Marlboro' type.

EARL RUSSELL, at Guildford, where he has twice been fined for exceeding the motor speed limit, summoned a cabman who had obstructed the main London road. The man was fined £1.

THE value of the motor-car has been demonstrated in elections in rural districts; it was also seen in the election of the sheriffs for the City of London, one candidate having thirty cars at his disposal.

IN addition to their other well-known department, Messrs. D. Doyle, Ltd., have opened a new and extensive garage and repair department at 13, West Street, Shaftesbury Avenue, W.C., under the personal supervision of Mr. Doyle.

THE Standard Motor Agency, Ltd., of Albany Street, Regent's Park, N.W., has taken up the sole agency of the industrial motor vehicles built by Messrs. Horn, Littlewood and Co., Gainsborough, for London and the South of England.

A Group of Arrol-Johnston Cars at Kilmalcolm.

several hours were enjoyably spent. The greatest interest was evinced on the way at the large turnout of cars. Mr. John S. Napier, the managing director of the firm, was one of the party.

A MOTOR-CAR struck Professor H. A. Ward while he was walking to the station at Buffalo, U.S.A., to take a train to his summer house on Thursday last week. He died within two hours. The late Professor was one of the most distinguished mineralogists and geologists and was a Fellow of many London scientific societies.

SKEGNESS has lately come much to the fore, and the races on the sands last year did much to make the town popular with motorists. Messrs. Ensor and Ball, a local firm, have brought out an excellent pictorial guide which should do much to attract visitors to Skegness as well as prove an appreciated souvenir for those who have finished their stay.

AN important process for the repairing of aluminium cases is now being successfully applied by Mr. Robert W. Coan, of 219, Goswell Road, London, E.C., who, after long and careful experiments, has been able to discover a method by which he can effectively and economically repair cracked or broken aluminium castings. Hitherto cases slightly cracked or broken have been put on the scrap heap and considered as of no value, but Mr. Coan is able to deal with these of any size and can effectively "cure" large holes in a few days. This will result in a large saving to all who have hitherto been unable to get such work done, not to mention the loss of time that frequently takes place when such replacements are ordered from the Continent.

LAST year the Lincolnshire Automobile Club held a series of successful motor races on the seashore at Mablethorpe, which were to be repeated to-day (Saturday). Owing, however, to only twelve entries being received up to Monday, the committee have decided to abandon the races.

At Clarence Barracks, Portsmouth, recently, a class composed of N.C.O.'s and men of both services desirous of becoming motor-car drivers was examined by the Examiners of the A.C.G.B.I. for the purpose of awarding the club's driving certificate to those successfully passing the various tests.

A FEATURE of recent trials has been the successes of the Siddeley and Wolseley cars. In the Scottish Reliability Trials both the 15-h.p. and 25-h.p. Siddeleys made non-stop runs. In the South Australian trials a 6-h.p. Wolseley was successful. In the Land's End to John o' Groat's motor-cycle run an 8-h.p. Wolseley carried the officials through without trouble from start to finish, and a 6-h.p. Siddeley climbed the hill at Loch Striven head.

IN view of the great development of the Argyll Company's business it is interesting to note that there are still several very early specimens of the Argyll car on the road, doing good service. Mr. James Kirk, Glasgow, makes constant use of a little Argyll which he purchased at the Glasgow International Exhibition of 1901, and Mr. F. G. Drew, of Gloucester, still has one of the cars built by the firm in 1900. All the parts are in good condition.

THE A.C.G.B.I. has now 3,000 members.

MR. ROLAND BARRAN, M.P., has lately acquired a 30-40-h.p. Belsize landaulet.

THE Ulster Motor Works have a well-equipped garage and workshop at 52, Donegall Street, Belfast.

THE Critchley-Norris Motor Company have secured an order for two 40-h.p. 'bus chassis for Messrs. F. Groome, Ltd., Whalley, near Blackburn.

GARAGE accommodation for a dozen cars is placed at the disposal of motorists visiting Peterborough by the Montgomery Motor Company, Limited.

THE Daimler Motor Co. (1904), Ltd., announce that, in accordance with their previous custom, the Coventry works will be closed down from Saturday, August 4th, to Monday, August 13th.

FROM Dr. H. Stanley Ballance, of Weston-super-Mare, we have received a sample of a little instrument he has devised and patented to facilitate the work of cleaning and filling up cuts and gashes in the outer covers of tyres with any of the well-known stoppings. The tyre cut stretcher, as it is known, consists of a spring steel tool somewhat on the lines of a pair of wire sugar tongs, but with two downwardly-turned pointed ends. These are pressed together and forced into the cut or gash of the tyre. The tool is then turned a quarter way round

and released, when its points spring apart and hold the gash open, so that it can be easily cleaned out and filled right from the bottom with the solution or other material used. Dr. Ballance writes:—"I may say that I have myself used one of these 'stretchers' for nearly a year, and although I received my car in December, 1904, and have driven some thousands of miles, my tyres are still in excellent condition." The little tool, which will also be found useful in removing small stones from tyre cuts, is being put on the market by Mr. J. P. Curtis, manufacturing ironmonger, Weston-super-Mare.

THE story placarded about London by an evening paper last week as to repairs being necessary in Westminster Abbey, owing to the damage done to the structure by the vibration caused by motor traffic, has been denied by Canon Duckworth.

MOTORISTS contemplating Continental touring will be interested in an illustrated description of a journey through France and North Italy to Venice, written by one who recently enjoyed the trip on an Itala car. This can be obtained from the London agency, 89, Wigmore Street, W.

"SONGS of the Car, with De Omnibus Rhymes," is the title of a little volume of poetry by Mr. F. J. Cox, which is embellished with some illustrations by Mr. Howard Somerville, and published by Mr. Francis Griffiths. Many of the verses are extremely tuneful, and the poetry reaches a high level.

MR. E. J. PHILPOT has opened a motor garage at 34, St. George's Street, Canterbury.

THE Lancashire Steam Motor Company, Ltd., of Leyland, have just supplied a 4-ton steam wagon to the Crown Agents for the East African Protectorate.

COLONEL JOHN JACOB ASTOR is said to be the largest individual owner of motor-cars in New York, he having registered thirty-one vehicles, of which four have been cancelled.

MESSRS. WILSON AND STOCKALL, the well-known ambulance builders, of Bury, have just secured an order for two motor-ambulances of the Brougham pattern from the Belfast Corporation.

SEVERAL motor agents have enlarged their facilities for dealing with motorists this season, among them being Mr. T. E. Hollings, of Heysham Road, Morecambe, and Mr. J. Gray, London Road, Hatfield.

MR. W. WILLIAMS, motor agent, of Plymouth, recently took delivery of a 10-h.p. Alldays and Onions car at Birmingham, and ran it without a hitch to its new owner, Dr. Hamilton, of Plymouth, at an average speed of eighteen miles all the way.

AT the last meeting of the Gloucestershire Standing Joint Committee exception was taken to the police keeping the main road from Bristol to Gloucester and Tewkesbury free for the recent Land's End to John o' Groat's motor trial; but the chairman, in reply, pointed out that it was usual for the police on such occasions to exercise a kind of "grandmotherly" protection over the public.

IN presiding at the International Congress of Architects which met in London on Tuesday, the Duke of Argyll said that it might be surmised that with their noisy streets, motor-omnibuses, and traction engines they might have to go back in their domestic architecture to the Roman Courts. He was sure that the only place where one could have a peaceful hour's sleep at the present moment was in the inside of a quadrilateral fortress.

FINDING the present very extensive works in Kimberley Road, Kilburn, too small, Messrs. Panhard and Levassor have secured a site of over 2½ acres in the Uxbridge Road, between Shepherd's Bush and Acton, the distance from the West End being about the same as the present works. Operations are already in full swing on the erection of a model factory, which will be provided with every facility for quick execution of repairs. The machinery and appliances will be of the latest type, and all requirements in connection with motor-car repairs, general engineering, etc., will be provided.

FRISWELL (1906), LTD., is before the public just now, with a capital of £150,000, of which 50,000 preference shares and 50,000 ordinary shares are being offered for subscription. The directors are Messrs. H. D. L. McDougall (chairman), W. S. Matterson, Guy Lewin (manager), and Charles Friswell (managing director). The company has been formed for the purpose of acquiring, as a going concern, the business of motor-car auctioneers and agents, and dealers in cars, motor clothing, and accessories, carried on by Friswell, Ltd. It will also acquire the sole agencies for the Peugeot and Westinghouse cars. The net profits for 1904 and 1905 were over £17,000, and the turnover for the present year has shown a satisfactory expansion. Mr. Charles Friswell has agreed to remain as managing director until June 30th, 1909.

AT a meeting on Saturday of the Cheshire Police Committee Colonel Hammersley, the chief constable, submitted a return showing the number and result of prosecutions under the Motor Car Act. The prosecutions in 1905 were as follows:—For driving recklessly, &c., 57 summoned, 52 convicted; for exceeding the speed limit (twenty miles per hour), 48 convicted and one dismissed; driving without licence, &c., 14 convicted; not having proper lights, &c., 51 convicted and seven dismissed; other offences, three convicted; total 181. The return for the quarter ending March 31st last showed that there had been 28 prosecutions, three cases being dismissed, one withdrawn, and fine or costs paid in the others. The total of last year's fines was £292.

## CONTINENTAL NOTES.

### The Scheveningen Automobile Week.

The popular Dutch seaside resort—Scheveningen—was last week the scene of an automobile fete. The meeting opened with a banquet on the 9th inst. The following day was devoted to a series of kilometre speed contests from a standing start and a flying finish. In the racing section the best times were:—Motor-cycles, M. Olieslagers, 6-h.p. Minerva, 50 sec.; cars from 400 to 650 kilos., Mr. Huntley Walker, 80-h.p. Darracq, 41 1-5 sec.; and cars under 1,000 kilos., Mr. Lee Guinness, 200-h.p. Darracq, 33 2-5 sec., this being claimed to be a new world's record. On Wednesday, the 11th inst., a driving contest and a gymkhana was held, and on the 12th a flower fete and procession of illuminated cars took place.

### A Projected Touring Car Trial in France.

Prior to the opening of the Paris Salon in December next it is contemplated holding a tourist car long-distance reliability run from Paris to Nice (or Biarritz) and back.

### A Touring Motor Bicycle Race.

The Motorcycle Club de Rheims is organising a 220 kilometre race for touring motor-bicycles for the 22nd inst. The event will take place over a 44 kilometre circuit in the neigh-

7), Frankfurt a. M. 5. It is prohibited by the police to drive with open exhaust pipe within the town limits of Frankfurt a. M. 6. In the Forsthausstrasse (the main road leading through the woods to Darmstadt-Heidelberg) the maximum speed must not exceed 15 kilometres, equal to about 9 miles. 7. All cars must carry at night two good lamps in front, and one small one in the rear to light up the police number. 8. Persons under the age of eighteen years are prohibited from driving automobiles. The secretary of the F.A.C., Taunusstrasse 1, telephone 1,187, will be pleased to give further information."

### The Dust Nuisance.

With the view of minimising the dust nuisance the Automobile Club de Namur-Luxemburg has issued a notice to its members urging them to arrange the outlets from the silencers of their cars in a horizontal plane instead of vertical. The Chambre Syndicale de l'Industrie Automobile Belge is also making a similar recommendation to manufacturers.

### Touring in Germany.

The German Minister of Finance has issued an ordinance permitting refund of the import duty paid on motor-cars temporarily introduced into Germany to be made even when the cars leave the country by a different Custom house from that at which they entered.

Mr. Lee Guinness on his 200-h.p. Darracq, on which he has just established a new World's Record at Ostend. (See page 447).

bourhood of Rheims, the start taking place at Wez-Thuisy at 5.30 a.m.

### A Useful Notice.

The Frankfort Automobile Club has recently drawn up a circular in three languages—German, English, and French, giving some useful hints and instructions to motorists touring in that district of Germany, and has had a copy of the same posted up in all the principal hotels and garages in Frankfort-am-Main. An abstract of the English notice is appended:—"In the interest of tourists we beg herewith to draw attention to the following police regulations and to kindly request observance of same. 1. In Germany vehicles travelling in the opposite direction must be passed on the right-hand side; those travelling in the same direction must be passed on the left-hand side, except tramcars, which must be passed on the right-hand side. At the stopping places for tramcars speed must be considerably reduced. 2. In the streets of Frankfort the maximum speed for automobiles must not exceed that of a trotting-horse (equal to about 9 miles per hour) and at street crossings this speed must be reduced. 3. All drivers of automobiles must have in their possession a permit from the police authorities. 4. All automobiles must bear a police-number. Details regarding points 3 and 4 can be obtained of Messrs. Seiffermann and Uhl, Kronprinzenstr.

### Miscellaneous Items.

A Commission has been appointed in France to report on the question of the transport of the wounded in time of war by motor-cars.—The annual hill-climbing competition up Mount Ventoux, organised by the Automobile Club Vaclusien, is to be held on September 15th and 16th next.—Owing to difficulties with the authorities in regard to the keeping clear of the Susa-Mont Cenis Road, the Turin Automobile Club cancelled its annual hill-climbing competition, which was to have been held on Sunday last. The Florence Club has also indefinitely postponed the contest for the Consuma cup originally fixed for Sunday next.—So far nine cars—three each Pipe, Metallurgique and Minerva—have been entered for the Liedekerke Cup race, which is to be held on August 18th by the Belgian Automobile Club.—Messrs. Mutel and Co., of Paris, are now making two sizes of six-cylinder engines, 35-h.p. and 50-h.p.—It is announced that the industrial motor vehicle and motor-boat annexe at the next Automobile Salon, in Paris, will be located on the Esplanade des Invalides, instead of in the Serres de la Ville, as hitherto.—No less than seventy-five entries have been received for the Belgian touring contest known as the "Criterium," which is to be held from the 20th to the 26th inst.

## CORRESPONDENCE

Letters to the Editor should be addressed to the offices,  
27-33, Charing Cross Road, W.C.]

### PRESSURE OR GRAVITY FEED.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read the article on page 427 of the *M.C.J.* of the 14th inst., and may say that I have had very extensive experience with both systems of fuel feed. Taking the heads in your article, my experience leads me to the following conclusions:—

1. Safety.—If the main petrol supply pipe is fractured from a pressure-fed tank, the moment sufficient petrol has escaped to equalise the pressure inside the tank with that of the atmosphere, no further petrol will escape—that is to say, in other words, the leakage from a pressure fed tank is limited; while, on the other hand, should a supply pipe of a gravity tank fracture there is nothing to prevent the whole tank emptying. I have had a car burnt up from this cause. Further, it is an invariable custom to fit gravity tanks underneath the driver's seat, where any danger from fire is immensely increased owing to the proximity of the engine and exhaust pipes, whereas pressure tanks are invariably fitted at

One of the latest Baby Friswell Cars climbing a temporary gradient of 1 in 3 with four passengers up. The vehicle is fitted with a 6-h.p. De Dion Engine.

the extreme back end of the chassis underneath, where leaking petrol drops straight on to the road, and is therefore practically harmless.

2. Efficiency.—To any practical motorist who has extensively used both systems in very hilly country there can be no two opinions about the matter. Watch the difference between a gravity-fed car and a pressure fed vehicle going up such a hill as Porlock, or the hills out of Lynmouth and Ilfracombe, and hundreds of other hills one could name. I have seen many a gravity-fed car have to turn round and go up backwards.

3. Convenience.—The fact that a gravity tank takes up all the room under the driver's seat is sufficient inconvenience to make any touring motorist a permanent believer in the pressure system, the tanks for which are tucked away out of sight underneath the chassis.

4. Cost.—The difference in fitting the two systems is so insignificant as to require no comment.—Yours truly,

J. E. HUTTON.

### REFLECTIONS FROM GLASS SCREENS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In a case recently reported, the magistrate concluded that it was "dangerous to drive with a glass screen." I have found much difficulty in driving at night from the fact that lights behind the car are reflected in the screen, and appear like lights to be avoided ahead. I would suggest that the difficulty might be conquered by tilting the screen backwards or forwards from its present vertical position.

If tilted forward, and if the car carried a reading lamp in the roof, the light from this might still cause trouble. Tilted backward, the

glass would simply reflect to the eyes of the driver the darker part of the back of the car or the passengers therein, and the slight tilt of the glass would not interfere with the driver's clear view ahead.—Yours truly,

THEODORE F. S. TINNE.

### DRIVERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As a driver and anxious to fulfil all the conditions expected of same, I can quite appreciate Mr. Percy Richardson's letter on the above subject. As he rightly says, owing to the rapid growth of automobilism, and drivers not having had sufficient road experience, owners do not care to trust such men with a valuable car. Also his suggestion of a garage for giving greater experience on the road, is one that should call forth the appreciation of everyone interested in automobilism and every right-thinking driver would welcome it as a godsend. I also suggest that, having qualified instructors, it could be made self-supporting either by letting cars for hire or repairing parts of cars, such as tyres, accumulators, &c. I know from my own experience that I have been unable to obtain a berth owing to the facts Mr. Richardson mentions, and I daresay there are a great number in a like predicament. I would also suggest that men on being suited with a berth should also contribute a reasonable amount to help others over the stile, and only men with good references from previous employment be allowed to avail themselves of the advantages offered.—Yours truly,

G. G. SEARLE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As an old subscriber, will you allow me a small space in your valuable *Journal* to reply to Mr. Percy Richardson's letter? To quote his sentence, "In the first place, whilst there are hundreds of drivers wanting places."

I personally have had several years' practical experience in the trade, first as a "mechanic," then as a driver, but when I seek employment I am invariably asked, "Have you been in private service?" I answer in the negative, and particulars, out of courtesy, I suppose, are taken, and if I apply I am told I shall be considered with others. If I write I do not get an answer. Far be it from my thoughts to suggest that I am the best man that has applied, but in a few cases I have heard casually afterwards that a man has obtained the berth who has been in service before, and his experience (?) as a mechanic (?) and driver (?) is limited to a few months. Probably the man having been in service before outweighs with his employer the extent of his experience. I think in my humble opinion that the foregoing gives a sufficient answer to both points raised. I, at least, and probably others as well, am compelled to think that the would-be employer is to blame if "his motoring costs him more." Experience first, service afterwards, should be the motto for employers.—Yours truly,

CHAUFFEUR-MECHANIC.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We have read with much interest a letter from Mr. Percy Richardson appearing in your issue of 14th inst., in connection with a scheme for the production of experienced drivers. We think with Mr. Richardson that however sound a ground work a man may have in the knowledge of a motor-car, it is barely possible for him to obtain in one month sufficient experience to make him a thoroughly reliable chauffeur. The suggestion made by Mr. Richardson is particularly well timed, for there can be no doubt that many owners have a difficulty in obtaining drivers whom they care—whether rightly or wrongly it is not for us to say—to trust.

This difficulty could undoubtedly be obviated by the establishment of a central school where learners could get the six months' training which would give them the necessary road experience and which would entitle them to be considered competent and trustworthy drivers. The conduct of this scheme as a commercial enterprise presents almost insuperable difficulties, and without some outside aid its success is impossible of achievement.—Yours truly,

B. W. MILLAR.

### RESTRICTION OF TRADE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The letter from a London agent in your last issue opens up a question of importance beyond the ordinary interest of newspaper correspondence, for it affects the development of the industry more than is at once apparent. Beyond that, it refers to a policy which cannot be maintained now that motorism has outgrown the swaddling clothes of the early advocates and is becoming one of the recognised British industries. Like your correspondent, I am interested in the 'selling side of automobilism'; but before fixing up my agencies I intend to take care that my legitimate interests are not hemmed in by conditions which can only harass the sale of cars in the future. Makers now insist that those to whom they give agencies shall take many more cars during the season than was the case a year or two ago. That is only the result of the great increase of business, and is a perfectly justifiable proceeding. But surely the increased number of cars now to be taken by the agent should be accompanied by perfect freedom to dispose of

them how, when and where he will. The "London Agent" who has opened discussion finds that he must not adopt certain means of publicity which have—and this should not be forgotten—been the best educators of the public in the past. Surely this is a ridiculous position. It is certainly one that I do not intend to be placed in.

I propose, and would advise others who may be revising their business arrangements, to insist that if I guarantee to sell cars I shall not be restricted as to the methods by which I will obtain customers and give the vehicles display before the public. If all agents were similarly disposed to safeguard their interests these attempts at restriction of trade would quickly be silenced.—Yours truly,

A FREE AND FAIR TRADER.

### THE HELE-SHAW CLUTCH.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The writer will be very much obliged if any of your readers would give him their experiences with the Hele-Shaw clutch. Whether there has been any trouble with it, and if so, what trouble, and what remedies have been employed. Also, does anyone know whether the Hele-Shaw clutch and the Argyll friction clutch are the same; if there is any difference, the writer would be glad to know what it is.—Yours truly,

HERBERT SMITH.

### CASES AGAINST MOTORISTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The summary of motorist convictions recently sent round the Press by the Highways Protection League "as a matter of public

Two of the Competitors in the Touring Body Competition.  
THE SCHEVENINGEN AUTOMOBILE WEEK. (See page 451.)

in every respect and devoid of the "faking" suggested. The 12-16-h.p. car which stands first of all petrol cars in the order of merit for South Harting hill climb is my own private property and has been driven upwards of 5,000 miles this season. It is geared to do forty-five miles per hour on the top speed at 1,500 revolutions per minute, the bevel gearing being 18 by 60. It is fitted with a full Roi-des-Belges five-seated body, and fittings for Cape cart road, and has no silencer cutout. If Mr. Jarrott has any specific cases in his mind, why not state them, in the best interests of the sport and industry?—Yours truly,

T. H. WOOLLEN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The formulæ at present adopted by various clubs are misleading and constitute a mischievous compromise for general satisfaction. For instance, the 18-24-h.p. Marchand which made such an excellent performance at the Wolverhampton A.C. contest, climbing the hill in fastest time by some 20 sec., is relegated in the handicap to the sixth place. It is not so much the adoption of the handicap formulæ with which we find fault as the erroneous inference drawn by the lay mind. If any specific formula be adopted, the published result should be accompanied with some indication of the car's performance in point of time, so that the public may see at a glance the position of each individual car as regards its actual performance. Trusting this most important matter will have the consideration it deserves.—Yours truly,

WILLIAM PILKINGTON, JUN.

### CARS FOR MEN OF MODERATE MEANS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I shall be very much obliged if one of your experienced readers can tell me of a really quite reliable place where a small car, costing

(De Auto.

interest" proves nothing. We want figures of a more comparative nature, namely, the total number of motor-cars in actual use during the month of June, and an idea of the aggregate mileage covered, which will enable "fair-minded" people to form an opinion of the relative dangers of horse driven and self-propelled traffic.

Even if 357 proceedings did result in 324 convictions, it must be remembered that in the matter of alleged offences against the speed limit (numbering 227) motorists rarely trouble to defend a summons. It costs more to win than to lose. On the principle that the police cannot lie and never make mistakes, the odds in favour of their version are appallingly heavy, and whenever their evidence is torn to shreds and flagrant errors are proved up to the hilt, all the justice awarded a motorist is a grudging benefit of the doubt and the privilege of paying the expenses of his defence.—Yours truly,

STENSON COOKE.

### HILL CLIMBING COMPETITIONS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the discussion on the above subject I have suggested to the Competitions Committee of the A.C.G.B.I. that they might meet a deputation of say three of the most successful competitors in this year's hill climbs, three unsuccessful competitors, and three members of the Society of Motor Manufacturers and Traders, with a view to deciding upon a formula for next year's competitions.

With regard to Mr. Jarrott's remarks that "every subterfuge possible is adopted by the various manufacturers interested to enter machines which have either been specially built or specially faked up for the purpose of winning the event," they are unjust in the majority of cases. I say this as a former hon. official of the Club and as a present season competitor. May I say that the Clement-Talbot cars which have done so well in the numerous hill climbs entered for, are all standard cars

under £100, can be purchased. I have had a long series of second-hand cars, each reported either shop-soiled, used a few times, or "sold on account of illness of owner!" Each one has after a few weeks shaken itself into inefficiency or developed one of the countless ailments well-worn cars are heir to. I do not know whether to get a 100-guinea Rover, or if it is possible to get a bigger car that has *bona fide* done very little work and can be depended on for running some hundred miles without constant visits to a shop. Solid tyres not objected to.—Yours truly,

WORRIED MOTORIST.

### EXHAUST ODOURS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am glad to see, from a recent issue of the *M.C.J.*, that the Motor Union is taking action with regard to the uses of exhaust cut outs. I venture to submit, however, that the whole question of exhaust is one that requires careful consideration on the part of motor manufacturers. The exhaust gases from a petrol motor possess a characteristic odour more or less unpleasant to the sense of smell. Every passing car leaves behind it a trail of these gases, which are wafted into the nostrils of pedestrians, and the dislike of the automobile on the part of the general public is at least aggravated by this effect. As long as motor vehicles are not much more numerous than at present, the objection to exhaust gases may not be of much weight, but it can hardly be doubted that when, say, every second vehicle in city traffic is motor propelled, the odours from the exhaust will present a serious problem. The causes of the characteristic odour of petrol motor exhaust have never been thoroughly investigated. The odour is entirely different from that of the products of combustion of a petrol burner, as used on steam cars, and is also rather different from that of carbon monoxide, the compound produced when a hydrocarbon is burned with

an insufficient supply of air. These are the two oxides of carbon which are produced in ordinary combustion, but their presence in the exhaust does not explain the peculiar smell of the gases. In connection with this matter, it may be of interest to mention that a new oxide of carbon has recently been discovered, the molecules of which consist of three atoms of carbon and two of oxygen. This compound can be produced in the laboratory by a somewhat involved process. Is it not possible that it is produced in the cylinder of a petrol engine when the charge is too rich. It has a penetrating odour and burns with a smoky flame.

Mention has frequently been made of preparations which, when added to petrol or oil, would obviate the smell from the exhaust. Only the other week I saw a reference to a new one called "Carfume" in the *M.C.J.* Although I have not yet tried the latter, the efficacy of any such compounds is much to be doubted, and in any case they are merely attempts to mitigate an evil, and not to remove it.—Yours truly,

G. W. SIMPSON.

### EXPERIENCES WITH TYRES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to Mr. Moore, *re* experience of tyres, I have driven a set of Moseley's Perfect tyres 2,300 miles to date, and I am very pleased with the behaviour of them. I have not had to touch the front

Sir Alfred M. Watkin, a Director of the South Eastern and Chatham Railway, on his 10-h.p. Star Car.

tyres at all and the back ones have only been blown up after punctures, of which I have had three. They appear to have worn very well and look like doing a lot of work yet, and the ease of riding with these tyres is quite exceptional.—Yours truly,

HUMPHREY BENNETT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to Mr. Moore's inquiry, I have had a set of these in use on my 12-16-h.p. Armstrong-Whitworth which have run about 4,000 miles. The weight of my car is 2,600 lbs. and the size of tyre 32 by 5. I am glad to say that up to 3,800 miles I did not have a puncture, and I was then able to find out for myself the easy detachability and replace the inner tube and pump up again in about a quarter of an hour.—Yours truly,

C. PROCHOWNICK.

### TESTING MAGNETOS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice in the *M.C.J.* of the 7th inst. an instructive article on testing magnetos, and also a letter from a correspondent asking how this should be done. There is one way by which it is possible to tell quickly which often saves a lot of time and trouble, that is by, noticing the colour or quality of the spark. A magneto when in proper order

will give a rich blue flaming spark, but if a magneto is weak the spark that is visible then will be "pinky red" in colour, and this is a sure sign that the magnets require to be remagnetised. The first Simms Bosch low-tension magneto I fitted in 1899 is running to-day, and giving as good a spark and starting as easily as the day it was put on.—Yours truly,

G. H. WAIT.

### PRESSURE OR GRAVITY FEED FOR CARBURETTORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the article on this subject in the last number of the *M.C.J.*, I should like to know what objection there is to having the petrol tank in any convenient position and pump up the petrol from it into a quite small reservoir, from which it should fall by gravity into the carburettor. The pump would have to raise constantly the largest quantity of petrol ever required for use, and the surplus would return to the petrol tank by an overflow pipe. Thus the flow into the carburettor would be from a reservoir with a constant head of fluid, which in itself would be an advantage.

It appears to me that this arrangement would give all the advantages of position obtained by the use of pressure feed, the advantages of safety secured by gravity feed, with very little extra cost beyond the gravity feed arrangement alone.—Yours truly,

A. G.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was very much interested in the article on this subject in the last issue of the *M.C.J.*, and I cannot help thinking that all the complication of the pressure feed is hardly warranted by the end attained, particularly as the same result—a constant head upon the petrol—can be obtained in a more simple manner. Indeed, many manufacturers attain sufficiently good results with the simple gravity feed without refinements or complications of any sort, and carry their tanks where they are as much out of danger as any part of a car can be. Petrol tanks which are under pressure must have absolutely tight filling caps, or there will be an escape of inflammable vapours, and the check valve which allows the entrance of the pressure is a source of possible trouble. Such a valve sometimes leaks or sticks, and should it fail to work properly, an interruption of the petrol supply might be the result. It seems dubious engineering to use special apparatus for securing the necessary head of motor spirit, which apparatus is subject to several causes of derangement, when gravity, an absolutely constant and dependable force, is always acting.—Yours truly,

W. PLAYER.

### INSPECTION PIT DANGERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the articles in the *M.C.J.* of the 7th inst. headed inspection pit dangers, may I be allowed to draw attention to what I saw exhibited at the recent Motor Car Show at the Agricultural Hall, the motor-car elevator, which was explained to me by the patentees and manufacturers, Messrs. Adams and Co., Tunbridge Wells? A car was drawn up two inclined steel channels to the required height, which readily allowed inspection of any part of the under side of the car in daylight, thus avoiding any necessity for a light, and making it impossible for the fumes of escaping petrol to collect. It is, indeed, just the thing, in my opinion, to prevent such accidents as those explained in your paper, and I certainly think that while such capital appliances are on the market it is the employers' own fault if further explosions occur in their pits which are dug out of the ground.—Yours truly,

G. T. ASTON.

### MOTOR-OMNIBUS IMPROVEMENTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was glad to see from a recent issue of the *M.C.J.* that you are urging those responsible for the increasing number of motor-buses in London to adopt a uniform height for the steps from the ground. I am afraid I must plead guilty to being one of those who jump off before the vehicle stops; but after one or two nasty shakes, owing to the varying height of the step complained of, I am now very chary of alighting from a motor-bus until it is almost at a standstill. Another point to which I think attention might also be usefully given is uniformity in the position of the hand rail which passengers grip as they mount and descend from motor-buses, the position of these rails also showing considerable variation. Finally, I would like to suggest that the mudguards of the rear wheels should be carried back as far as the step, in order to prevent mud being splashed, in wet weather, on to ascending and descending passengers.—Yours truly,

S. W. HUDSON.

SMALL CAR EXPERIENCES.—"Sunlight" writes:—"Would any of your readers who are owners of 1906 8-h.p. single-cylinder Peugeotts kindly give their opinion and experiences of same, what the best speed would be, and how much the average; also as regards silence and hill-climbing?"

## HILL CLIMBING CONTESTS.

## LEWISHAM A.C.

AFTER the performance of the "Brown" motor-bicycle, with R.M. Brice up, at the Lewisham Automobile Club's hill climb up Westerham Hill on July 7th, in which it won both motor-cycling events, some of the riders of other makes of machines requested an official inspection of the machine. The bicycle was then sealed, and the inspection by two judges has now taken place, with the result that they have testified from actual measurements that the bore is 82 mm. and the stroke 88.5 mm. and that the engine is in accordance with standard construction.

## HE "HENRY EDMUNDS" TROPHY.

ON Saturday the third race for the "Henry Edmunds" hill-climbing challenge trophy took place in Blackdown Park, Fernhurst, Sussex, by permission of Mr. F. S. Philipson-Stow, J.P. This trophy was presented by Mr. Henry Edmunds in 1902, the details of the competition being left entirely in the hands of the A.C.G.B.I., and the trophy always remaining on the Club premises. The trophy was won for the first time at Castlewellan, Ireland, in July, 1903, by Mr. E. Campbell Muir. Last year the trophy was won by a 30-h.p. Daimler, entered by the Rev. F. A. Potts, and driven by Mr. C. Grinham.

There have been some disputes over the exact gradients of the hill, but the most recent survey gives acclivities of one in seven for the first half-mile; one in 4½ for a short piece which includes the dangerous curve where several mishaps have occurred, and one in eleven for the remainder of the distance. The road had been very carefully prepared by Mr. Stow's estate staff for Saturday's competition, and nature had assisted in perfecting its condition. Though larger than last year, the entry included only eighteen cars, and of these seven did not arrive. Those competing were, in accordance with the rules, of a recognized tourist type, carrying four passengers, including the driver. Each had to make three runs. There was very little worthy of note in the ascents, and nothing of a serious nature marred the pleasure of the afternoon.

The results were as follows, Mr. Barwick having the best time in each run:—

	Marks.
1. Mr. G. S. Barwick, 30-40-h.p. Daimler ...	647
2. Rev. F. A. Potts (holder), 30-h.p. Daimler ...	626
3. Mr. E. Manville, 30-40-h.p. Daimler ...	616
4. Mr. P. Brodtmann, 30-40-h.p. Daimler ...	601
5. Mrs. Herbert Lloyd, 30-h.p. Daimler ...	570
6. Mr. J. E. Hutton, 40-h.p. Berliet ...	530
7. Mr. Cecil Edge, 45-h.p. Napier ...	507
8. Mr. H. P. MacConnell, 24-h.p. Rapid ...	499
9. Mr. T. C. Pullinger, 30-40-h.p. Humber ...	428
10. Mr. P. A. Wilkins, 28-36-h.p. Daimler ...	338
11. Mr. F. Coleman, White Steam Car ...	—

Mr. C. Grinham drove the second car and was 21 sec. behind the winner. Mr. G. Barwick's Daimler was fitted with Continental tyres. The 3rd, 4th, 5th, 6th, 7th, 8th, and 10th cars to follow were also shod with Continentals.

Col. H. C. L. Holden was chairman of the Competitions Committee as well as judge, the starter being Major F. Lindsay Lloyd, R.E., with Mr. Mervyn O'Gorman as head marshal and Mr. J. W. Orde secretary of the meeting. Subsequently the competitors were entertained by Mr. and Mrs. Philipson-Stow, for whom cheers were heartily raised upon Colonel Holden's proposition. Replying, Mr. Stow said that when he first became enchanted by motoring he realised that it was one of those things which, when once taken up, could hardly be left alone. He had never relinquished interest in automobilism, and was convinced that the manufacture of motor-cars and cycles would become one of the largest industries in the world.

## WOLVERHAMPTON.

THE results of the hill-climbing competition recently promoted by the Wolverhampton Automobile Club have now been officially supplied for publication. The climb was at Harley Bank, Wenlock Edge, and the course is about one and a quarter miles long, with a varying gradient, which in places is 1 in 7.

Thirty-one cars had been entered for the open competition, and of these twenty-four weighed in. For the club competition there were eighteen entries, and twelve weighed in. Mr. S. R. Rhodes was the judge, and official timekeepers were present. In the club handicap the first prize winner holds the Star trophy, value £25, and the president's prize; in the open handicap the first prize consists of one-half the net entrance fees, and the winner holds the Wolf trophy, value £10 10s. Mr. C. H. Evans won both events. Results:—

Position.	Competitor.	Car.	Figures.

## CAWKWELL.

CONSIDERABLE interest was taken in the hill climb, on Thursday of last week, at Cawkwell, in the heart of the Lincolnshire Wold. An effort was made to arrive at a fair handicap, and a formula similar to that of the Frome's hill climb was used. The hill is 966 yards long, with

MM. Clement Pere et Fils.  
(From a Caricature in *Le Chauffeur*.)

a total rise of 234 feet and an average of about 1 in 11½, some portion being 1 in 6.

Military flag signallers kept up communication from end to end, and generally the arrangements, as superintended by Mr. Godfrey Lowe, (Lincolnshire Club), were very good. Mr. C. B. Robson, a well-known farmer, though not a motorist, entertained the motorists at Cawkwell House.

The results were as follows:—

Name.	Car and advertised h.p.	H.p. as per formula.	Weight in lbs.	Time. M. S.	Marks.
1. Dr. Stitt Thompson ...	8-h.p. De Dion ...	5'15	1,580	3 17	64
2. Rev. M. C. Wilkins ...	10-12-h.p. Argyll ...	9'22	2,436	3 1	69
3. G. E. Sanders ...	44-h.p. De Dion ...	3'64	862	3 4	70
4. W. O. Chapman ...	8-h.p. De Dion ...	5'15	1,596	3 48	73
5. R. M. Wright ...	10-12-h.p. Humber ...	16'33	2,206	2 1	80

17. G. Garnett ...	8-h.p. M.M.C. ...	5'15	1,218	4 15	1'07
18. W. J. Newsum ...	15-h.p. Panhard ...	16'70	2,786	3 4	1'102
19. W. B. Parish ...	6-h.p. Rover ...	4'66	1,071	4 15	1'109
20. Col. J. S. Ruston ...	30-40-h.p. Daimler ...	36'29	3,036	1 33	1'12
21. J. G. Cook ...	16-20-h.p. Argyll ...	16'70	2,548	3 1	1'14
22. F. M. Mundy ...	24-h.p. Barriquand and Marre ...	25'81	3,052	2 22	1'20
23. P. Wright ...	10-12-h.p. Humber ...	16'33	2,044	2 38	1'26
24. Dr. W. Jagger ...	9-h.p. Cadillac ...	8'33	1,650	4 3	1'28
25. W. A. Tomlinson ...	10-12-h.p. Humber ...	16'33	2,200	3 0	1'33
26. C. E. Newton ...	10-12-h.p. Humber ...	16'33	2,205	3 17	1'45
27. W. S. Foster ...	24-h.p. Georges-Richard ...	22'34	2,317	1 50	1'60

## BIRDLIP.

THE official results, based upon the handicap calculations in the Birdlip Hill climb of the Bristol and Gloucestershire A.C., reported in our issue of the 7th, have now been made known. The gold medal in Class A is awarded to Mr. Aubrey Le Blond's 8-h.p. De Dion; the silver medal to Mr. W. J. Bridge's 8-h.p. Rover. In Class B, Mr. E. A. Stretton's 10-12-h.p. Clement-Talbot obtains the gold medal, the silver medal going to Captain Tudor Owen's 12-16-h.p. Clement-Talbot. Mr. F. J. Tucker's 28-36-h.p. Daimler is placed first in Class C; Mr. E. H. Atchley's 30-40-h.p. Daimler second. These receive the gold and silver medals respectively, whilst Mr. J. S. Davey's 30-40-h.p. Daimler has been awarded the silver cup for the fastest time.

## ASTON HILL.

OWING to a clerical error the 14-22-h.p. Germain cars which were entered in this competition of the Hertfordshire County A.C. were described as having a bore of 93 mm., whereas the actual bore is 92 mm. This was not noticed until after the official results were issued, and Capt. Masui immediately wrote to the secretary of the Hertfordshire A.C., informing him that some mistake had been made. He replied stating that the error must have emanated in the entrant's office, adding "This is to be regretted, as upon my working out the 92 mm. bore and 110 stroke, it would have placed you first in the handicap." The secretary of the County Club, Mr. T. Williams, accompanied by two experts from the A.C.G.B.I., have since called at the Germain garage at Westminster, and after a thorough examination, taking the engine to pieces, satisfied themselves that a mistake had been made, and that the bore was only 92 mm., the stroke being 110.

## SOUTH-HARTING.

THE order of merit at the South Harting Hill Climb, after revision by the handicapper, Mr. Worby Beaumont, shows that the first three cars in each class are as follows:—

CLASS A.—1, 10-h.p. Stanley; 2, 10-h.p. Alldays; 3, 10-h.p. Alldays.

CLASS B.—1, 12-16-h.p. Clement-Talbot; 2, 12-16-h.p. Talbot; 3, 14-h.p. Thornycroft.

CLASS C.—1, 28-h.p. Pire; 2, 30-h.p. Daimler; 3, 22-h.p. Berliet.

CLASS D.—1, 60-h.p. Napier; 2, 30-40-h.p. Peugeot; 3, 30-40-h.p. Peugeot.

## MOTOR-CYCLE RACING

THE first race meeting promoted by the Essex Motor Club was held at Canning Town on Saturday, in the presence of a large gathering of onlookers. A capital programme of events had been arranged, but the enjoyment of the proceedings was marred by a serious accident to René Thomas, the French champion motor-cyclist, whilst competing in the one hour record race. There were seven starters for this event, and the men had got well under way and were travelling at a terrific speed, when Thomas, in attempting to pass the leader at the bend, was noticed to swerve. Then the back tyre slipped from the rim of his machine, and despite his efforts to keep a straight course preparatory to stopping, he ran direct into the railings at the top of the bank, striking them with great force. He rolled over and over with his motor-cycle down the bank on to the track, and fortunately reached the grass just before the next competitor passed. When attended to, it was found that his right leg was broken in two places, and he had also sustained a severe wound on the head. He was subsequently conveyed to the West Ham Hospital. The race was won by H. V. Collier (on a Matchless), who rode 46 miles 533 yards, J. Perkins (Crownfield) being second. No other competitor finished. The other races resulted as follows:—

Five Miles Tourist Handicap.—Final heat: W. W. Genn (Eland), 10 sec. start, 1; S. Webb (Quadrant), 60, 2; F. W. Appletree (Rex), 25, 3. Won by 80 yards. Time, 7 min. 52 1-5 sec.

Five Miles Handicap for Racing Machines.—Final heat: J. Perkins (Crownfield), scratch, 1; W. Hodgkinson (J.A.P.), scratch, 2; W. W. Genn (Eland), 5 sec. start, 3. Time, 6 min. 24 1-5 sec.

G. Barnes v. Five Miles Flying Start Record.—Barnes rode the distance in 4 min. 58 3-5 sec. In the second lap his frame broke, but he continued to the end, beating C. R. Collier's time of 5 min. 28 1-5 sec. Collier had ridden the distance from a standing start in 5 min. 12 sec.

The matches between Thomas and Perkins and Barnes and Anzani and the ten miles record attempt by G. Barnes were abandoned in consequence of the accident.

## TRAMCAR v. MOTOR-BUS.

A VANGUARD motor-omnibus was crossing the tramway lines in the New Kent Road, near the Elephant and Castle, on Sunday evening, having just started for Cricklewood, when it was run into by one of the electric tramcars, which struck it near the conductor's platform. There were about twenty passengers in the motor-omnibus, and these were thrown from side to side in the vehicle, several of them being hurt so much that they had to be conveyed to Guy's Hospital. They were there treated, and most of them were then able to go to their homes. The motor-omnibus was disabled, but the electric tramcar was so little damaged that it was able to continue on its journey. Some passengers of the Vanguard were attended to by local medical men who were quickly summoned to the spot. The driver had a very narrow escape, but was only slightly injured. The conductor had his collar-bone dislocated and was badly bruised.

## CLUBS AND ASSOCIATIONS.

## WELSH.

A MOST successful non-stop run was held on the 4th inst. by the Welsh Automobile Club from the headquarters, the Tenby Hotel, Swansea, to Tenby and back, a distance of 110 miles, the route being *via* Pontardulais, Crosshands, Porthryd, and Carmarthen. There were twenty-two entries, the cars ranging from 30-h.p. four-cylinder to 8-h.p. single-cylinder. The committee's awards were made on Thursday of last week and show that the following obtained absolute non-stop certificates:—Mr. H. J. Thomas's 10-h.p. two-cylinder Argyll, Mr. A. Williamson's 10-h.p. two-cylinder Enfield, Mr. S. L. Gregor's 10-h.p. two-cylinder Darracq, Mr. B. W. Valentine's 14-h.p. four-cylinder Clement Talbot, Messrs. P. and M. Player's 12-h.p. two-cylinder Wolseley, Mr. H. F. Taylor's 10-12-h.p. two-cylinder Richardson, Mrs. T. Penrose Thomas's 18-22-h.p. four-cylinder Daimler, Mr. W. Thomas's 8-10-h.p. two-cylinder Lacoste, Mr. J. S. Brown's 15 22-h.p. 4-cylinder Darracq, Mr. George Ace's 16-20-h.p. four-cylinder Beeston Humber.

The remainder finished well (only one car being a few minutes behind the time limit) but were disqualified for minor adjustments. The cars did splendid running and made excellent time over a somewhat difficult course which was admirably policed throughout. Tenby, being a control, was flagged in and out of the town, the whole of the arrangements being admirable, owing to the indefatigable efforts of the trial secretary, Mr. C. H. Harvey, to whom the club is much indebted for the success of the run. Mr. A. J. Moffat acted as timekeeper and chief observer.

The Club are now arranging motor-cycle reliability trials, which bid fair to be equally successful. The Welsh Club is growing apace, new members being elected at almost every meeting. A deal of useful work has been done and the financial position is strong.

There will be a joint meet of the Club with the South Wales and Monmouthshire Club at Porthcawl on July 28th, the Esplanade Hotel being the appointed headquarters.

## DERBY.

ON Saturday a motor gymkhana event, under the auspices of the Derby and District Automobile Club, took place at Trent Bridge, Burton-on-Trent.

The meeting was arranged in aid of the Mayor of Burton's Distress Fund, and was under the patronage of the Mayor of Burton (Mr. T. E. Lowe), the Mayor of Derby (Mr. E. T. Ann), Hon. Geo. Allsopp, Mr. Wm. Bass, Mr. S. R. Evershed, Mr. John Gretton, Mr. R. Hutton, Major R. E. Ratcliffe, Mr. C. J. Stewart, Messrs. H. Mead Taylor, R. Thornehill, C. H. Trip, R. B. Wragg, and others.

The competitors and their cars were as follows:—

Mr. R. Sutton Clifford, jun. ...	12-h.p. Richard-Brasier.
Mr. Cyril Smith ...	8-h.p. Rover.
Mr. G. B. Fletcher ...	9-h.p. Mohawk.
Mr. H. G. W. Dawson ...	7-8-h.p. Swift.
Mr. H. Jefferson ...	8-10-h.p. Humber.
Mr. C. J. Allin ...	8-10-h.p. Humber.
Mr. Francis A. Bolton ...	34-45-h.p. Daimler.
Mr. Joseph Hill ...	24-h.p. Ryknield.
Major R. F. Ratcliffe ...	35-h.p. Daimler.
Mr. M. Ross-Browne ...	22-28-h.p. Richard-Brasier.
Mr. R. W. Sale ...	74-h.p. Wolseley.
Mr. E. P. Maltby ...	16-h.p. Richard-Brasier.
Mr. L. P. Mell ...	15-h.p. Darracq.
Mr. C. T. Leech ...	18-22-h.p. Daimler.
Mr. B. Sadler ...	8-h.p. De Dion.
Mr. A. E. Kirton ...	8-h.p. Motor-cycle.
Mr. C. A. Newton ...	8-10-h.p. Humber.
Mr. G. F. Heath ...	10-h.p. Darracq.
Mr. F. Smith ...	16-h.p. Rover.

The prize-winners were:—

Skilful Driving Competition.—First, R. Sutton Clifford, junr.; second, M. Ross-Browne; third, G. F. Heath.

Tortoise Race.—First, M. Ross-Browne; second, R. W. Sale.

Potato Race.—First, M. Ross-Browne; second, Major R. F. Ratcliffe; third, F. Smith. Mr. Ross-Browne by going very slowly managed to get all his potatoes in and just beat Major Ratcliffe, who relied more on his speed than in placing the potatoes and thus incurred penalties.

Tilting at the Ring and Pig-sticking.—First, C. J. Allin, 1 min. 11 2-5 sec.; second, C. T. Leech, 1 min. 38 2-5 sec.; third, F. Smith, 1 min. 39 2-5 sec.

Speed-judging Competition.—A definite speed of fifteen miles per hour was decided upon, the winner being the driver who went round the course at the nearest pace to this. The course was just a quarter of a mile round and should thus take exactly one minute. Each car carried an observer, so that the competitors relied on their judgment only.

First, C. Smith, 1 min. 1-5 sec.; second, G. F. Reading, 1 min. 2-5 sec., and G. B. Fletcher, 59 sec.

The second place being a tie was run off and resulted in Mr. Fletcher qualifying for second place in 1 min. 3 1-5 sec., beating Mr. Reading, who on this occasion took 55 2-5 sec.

Speed Judging Competition for Spectators.—Major R. F. Ratcliffe drove once round the course, and the spectators were invited to write on tickets their estimate of the speed per hour, the winner being Mr. T. Thomas, whose estimate of 22 miles 1,000 yards per hour was practically correct, the exact pace being 22½ miles per hour.

Musical Chairs, for Ladies.—As the competition proceeded the excitement increased, and reached its height when in the last round but one Miss Heath and Miss G. Hutton tied. This was run off, and resulted in Miss Hutton narrowly defeating Miss Heath. The final fell to Miss Dora Smith, driven by her brother, Mr. Cyril Smith.

Immediately after the close of the competitions, which lasted until 7.30, the prizes were distributed by the Mayoress, Miss Lowe. Mr. F. A. Bolton, J.P., a vice-president of the club, in a short speech, on behalf of the club, thanked the Mayor and Mayoress and Major R. E. Ratcliffe for their attendance and support, and congratulated them and the officers of the club on the success which had attended their efforts. The Mayor briefly responded.

A spacious grand stand had been erected and there were numerous tents for the convenience of the spectators, including a large marquee in

Muriel Thompson (18-h.p. Siddeley), of the Kensington A.C. Dr. Thompson (6-h.p. De-Dion), Herts County Automobile Club, was second.

Turk's Head Competition.—Mr. F. R. S. Bircham (24-h.p. Iris), of the Hertfordshire A.C.

Lady Passenger Race.—The event for four-seated cars was also won by Mr. Bircham, who scored a narrow victory from Mr. Dobson (10-12-h.p. Humber), of the Kensington, after giving a time allowance.

The Passenger Race for two-seaters was a most exciting event, Mr. F. R. Hodson (8-10-h.p. Humber), Herts A.C., winning by a yard, while inches only separated second and third.

Balloon Tournament.—In this event toy balloons were pegged down in two parallel lines, and the competitors had to endeavour to burst them on alternate sides with the back wheel of the car. This naturally required very skilful driving, as was evidenced by the small number burst in the required manner. Dr. A. Lestock Reid (7-h.p. Panhard) of the Herts. A.C., was the winner, bursting three balloons.

Musical Chairs.—In the end it was found almost impossible to decide between the lady passengers on the cars driven by Messrs. Webster (15-h.p. Mora) and Colliver (12-h.p. De Dion) both members of the Herts. Club. The judges decided to award prizes to each.

At the conclusion of the programme the prizes were presented to the successful competitors by Mrs. McWhirter, the wife of the chairman of the Herts. County Automobile Club.

The officials conducting the meeting were: Judges, Messrs. E.

Col. J. S. Ruston on his 30-40-h.p. Daimler, in the Cawkwell Hill Climb.

which tea was very kindly provided for the members and their friends by Major R. F. Ratcliffe, whose generosity in this respect was greatly appreciated. The whole of the arrangements reflected the greatest credit on Mr. L. P. Mell, the Burton representative on the Committee of the club; Mr. C. J. Allin (hon. sec.), and Mr. C. T. Leech (hon. treasurer), who must have been highly gratified at the result of their labours.

The officials were:—Referee, His Worship the Mayor of Burton (Mr. T. E. Lowe); judge, Major R. F. Ratcliffe, M.P.; timekeeper, Mr. J. Auber, M.C.A.A.A.; clerks of the course, C. J. Allin, R. Sutton Clifford, jun., J. Fitchett, P. E. Joule, W. H. Jones, C. T. Leech, L. P. Mell, A. R. Wheeler, C. H. Yeates.

The next meeting of the club takes place on the 28th inst., being a competition for the possession of the club's handsome challenge cup.

#### HERTFORDSHIRE AND KENSINGTON.

On Saturday last a joint gymkhana of the Hertfordshire County Automobile Club and the Kensington Automobile Club was held at The Grove, Watford, the seat of the Earl of Clarendon, the president of the former club. In the splendid old deer park a very large concourse of spectators watched with the keenest interest the six events on the programme. Over sixty cars were on the ground besides many tri-cars, motor-cycles and carriages. The events were as follows:—

Starting, Stopping, and Bending Race.—This was won by Miss

Shrapnell Smith and W. Whittall; marshals, Messrs. W. Edmunds, R. Mainwaring Finley and E. Webster; timekeeper, Mr. C. Wheeler; starter, Mr. A. J. Salmon. Mr. T. Williams, hon. sec. of the Herts. County Automobile Club, was secretary of the meeting, while Mr. J. H. Reeves represented the Kensington Automobile Club.

#### LEICESTER.

On Saturday eighty crippled children from Leicester were taken in twenty-five motor-cars lent by members of the local Automobile Club to Radcliffe Hall, where they were entertained by Mr. and Mrs. Robert Walker. After tea Mr. Groves expressed the thanks of the Leicester Cripples' Guild to Mr. and Mrs. Ralph Walker and to the members of the club who had so kindly lent their cars. Mr. Ralph Walker, in reply, said the pleasure was his and his wife's, and he hoped they would spend a happy day. After tea a lorry was brought round and twenty cripples found a place thereon, who were conveyed to the river, where a new surprise awaited them, Mr. Kenneth Walker being in readiness to take them a trip up the river in his motor launch. On their return another twenty were waiting, till all who were thus inclined had had an opportunity of satisfying their aspirations.

Among those who kindly lent cars were the following:—Mr. E. G. Mawbey (president of the Leicestershire Automobile Club), Mr. H. R. Harding, Mr. T. C. King, Mr. A. H. Faulkner, Capt. Byron (two cars), Mr. J. A. Doran, Mr. C. Bennion (two cars), Mr. H. A. Hamshaw, Mr. G. H. Wait, Mr. Alfred Corah, Mr. J. A. Harper, Mr. W. H. Warburton

Major Martin, Dr. Pemberton Peake, Mr. P. L. Baker, Mr. J. Marsden, Mr. W. Bentley, Mr. T. C. Clarke, Mr. J. H. Sutton, Mr. Merton Dawburn, and Dr. Patrick. Valuable help was rendered by Mr. A. Groves (president of the Cripples' Guild), Dr. McAllister-Hewlings, Mr. J. G. McAlpin, Mr. W. Noble, and Mr. A. McAlpin (hon. secretary of the Leicestershire Automobile Club).

### NORTH-EAST LANCASHIRE.

THE North-East Lancashire Automobile Club's postponed hill-climb contest has been fixed for Wednesday, the 25th inst. The venue is Rivington, a hill with a gradient of one in ten, and exactly a kilometre in length. Rivington is best reached *via* Blackburn, Feniscowles and Chorley, and is near Horwich.

### MOTOR CYCLE UNION TRIALS.

THE annual 400 miles reliability test promoted by the northern section of the Motor Cycle Union of Ireland took place on Friday and Saturday last. The course was, first day Belfast to Dublin and back; second day, Belfast to Londonderry, going by the coach road as far as Coleraine, going inland to Derry, and returning to Belfast from Coleraine to and through Ballymoney, Ballymena, Antrim, to Coramoney, where the course ended a few miles outside Belfast.

Over thirty entries had been received for the event, but only eleven faced the starter as under:—

H. Ferguson ...	...	Minerva ...	...	Belfast
R. M. Bryce ...	...	Brown ...	...	London
J. S. Gorrett ...	...	Rex ...	...	Belfast
J. Stewart ...	...	Triumph ...	...	Belfast
A. Bullock ...	...	J.A.P. ...	...	Belfast
R. W. Ireton ...	...	F.N. ...	...	Belfast
F. Hulbert ...	...	Triumph ...	...	Coventry
A. A. Dixon ...	...	Bradbury ...	...	Edinburgh
E. Nelson ...	...	Rex ...	...	Cardiff
J. B. Porte ...	...	Brown ...	...	Belfast
A. D. Blake ...	...	Coventry Eagle ...	...	Lorne

Owing to the rain of the previous night and the miserable outlook at the time of starting, 7 a.m. on Friday morning, several of the competitors decided to stand down at the last moment. Out of the eleven starters eight reached Tolka Bridge control, Messrs. Bryce, Hulbert, Stewart and Ferguson being first to arrive.

Messrs. Bryce, Hulbert, Stewart, Ireton, Ferguson, Gorrett and Nelson started on the second day's test at 7 a.m. on Saturday. Bryce retired at Larne through the steering post breaking away. Gorrett did not reach the turning point, and the following five finished at the Crown and Shamrock Inn, Coramoney: F. Hulbert, H. Ferguson, J. Stewart, R. W. Ireton, C. Nelson. Hulbert was placed first, gaining full points, Stewart being second and Ferguson third. Both Ireton and Nelson covered the course, but, being outside schedule, lost marks. The prize awarded for the best performance by a member of the Motor Union goes to R. W. Ireton.

### ESSEX.

THE members of the above club met at Heybridge on Saturday last, when they were the guests of Mr. E. E. Bentall, at his residence, The Towers, Heybridge (near Maldon). Luncheon was served in a large marquee erected in the very charming grounds to a party numbering nearly eighty members and friends, including the Mayor of Maldon and the chairman of the club, Mr. Burnett Tabrum. Appropriate speeches were made, after which a gymkhana was held in an enclosure kindly lent by the host.

The following entries were obtained, viz.:—Mr. Burnett Tabrum, J.P., Sir C. B. Locock, Bart., Mr. E. H. Renton, Col. Davies, J.P., Messrs. A. A. Knight, R. Page, F. C. Hill, Cayley, Miller, Curtis, Wharton, E. E. Bentall, Jones, James, B. Pash, Lindus Forge.

The programme consisted of five events, the winners of which were as follows, viz.:—

- Obstacle Race.—Mr. F. Lindus Forge, 14-h.p. Star.
- Ladies Passenger Race.—Sir C. B. Locock, Bart., 16-h.p. Fiat.
- Glass of Water Race.—Mr. E. E. Bentall, 16-h.p. Richard-Brasier.
- Needle and Thread Race.—Mr. F. C. Hill, 30-h.p. Wolseley.
- Musical Chairs.—Miss Dunn on Mr. Pash's 18-h.p. Mors car.

The silver medal given by the Motor Union was awarded to Mr. Forge, the hon. secretary of the club.

### SOMERSET.

By the invitation of Mr. and Mrs. Jackston-Barstow, a meet of the Somerset Automobile Club has been held in the picturesque grounds of The Lodge, Weston-super-Mare. Among the many motorists who took part were Messrs. R. B. Graves-Knyfion, J.P., H. A. Gliddon, Wallace Taylor, C. H. Dawe, and Dr. H. S. Ballance (Weston-super-Mare), J. Clark (Street), Orme (Ston Easton), W. J. Hippisley (Wells), Young (Bristol), T. M. Reed (Bridgwater), J. Amesbury (Huntspill), S. B. Alway (Bridgwater), Dr. T. W. S. Morgan (Timsbury), W. Yatman (Winscombe), F. J. Tucker (Keynsham), R. Y. Foley (Bridgwater), W. A. Woodley (Taunton), A. H. Bolton (Herefordshire Automobile Club), Tully (Shepton Mallet), J. W. Aspinall, and A. Armitage (Taunton), the hon. secretary of the club. During the afternoon an interesting series of gymkhana events were contested for valuable prizes, presented by Mr. and Mrs. Barstow, the results being as follows:—"S" Race, Dr. H. S.

Ballance (Weston-super-Mare). Potato Race, 1, Mr. A. W. Taylor (Weston-super-Mare); 2, Mr. Orme (Ston Easton). Bending Race, Mr. J. W. Aspinall. Gretna Green Race, 1, Mr. Tucker (Keynsham); 2, Mr. Young (Bristol). Tortoise Race, 1, Dr. Ballance; 2, Mr. Amesbury (Huntspill); 3, Mr. Tucker (Keynsham). The prizes were distributed by Mrs. Barstow, and subsequently Mr. Armitage heartily expressed the thanks of the members to Mr. and Mrs. Barstow for their hospitality.

### KENT.

ON Saturday Mr. and Mrs. T. H. Nash entertained the members of the club to a strawberry tea at their residence at St. Pauls Cray, when a large number of members and friends were present, amongst whom were Dr. Firth (chairman), Mrs. Firth, Mr. and Mrs. J. S. Darwin and Miss Darwin, Mr. and Mrs. Fraser, Mr. and Mrs. Wyllie, Dr. Tennyson-Smith, Mr. and Mrs. Waddington, Mr. and Mrs. Batchelor, Mr. and Mrs. Killik, Mr. Hall, Mr. Spencer, Mr. and Mrs. Gardner, Mrs. Kenyon and the hon. sec.

### CARDIFF.

A SPEED judging competition, open to members of the Cardiff Motor Club, was held on Wednesday. The course was from the first milestone beyond Ely to the sixth beyond Cowbridge, turning there and finishing at the milestone before re-entering Cowbridge—a total distance of twenty miles. Each competitor upon arrival at the starting point selected a sealed envelope, which contained instructions as to the speed at which he must travel. The winner was the competitor who adhered most closely to the rate of speed named in this letter of instructions.

The committee intend to enter a team for the M.C.C. team competition to be held at Daventry on Saturday, August 25th.

### IRISH.

ON Saturday the 4th prox. the Irish Automobile Club will hold a hill climbing competition at Ballinaslaught Hill, near Newtownmountkennedy, Co. Wicklow. There will be five classifications of cars, and the meeting is open to all owners of petrol and steam vehicles. Entries should be made to the secretary of the Irish Club at 34, Dawson Street, Dublin, up to the 27th inst., at the fee of one guinea for members of the club and three guineas for non-members. They will be received at double fees up to August 1st, after which date no entries will be accepted. The distance to be covered is little over a mile, and the meeting promises to be a successful one.

### MOTOR YACHT CLUB.

THE Motor Yacht Club is making a new departure in instituting a series of long distance trials to test the capacity of motor vessels to run continuously for long periods or over long distances without involuntary stops, as well as to ascertain fuel consumption, speed, &c. These will not in any sense replace the annual reliability trials, but will doubtless be appreciated by those desirous of quickly obtaining authoritative declarations as to the value of the performances of their boats.

### THROWING CAPS AT CARS.

AT the Leominster Borough Police Court last week, before the Mayor (Mr. G. Page), Mr. J. Page, and Mr. T. Smith, William Beavan, a lad nine years of age, was summoned by Mr. J. T. Hereford, of Sifton Court, Mordiford, for wantonly throwing a cap at a motor-car at Broadwood, on the 20th June. Mr. A. J. Corner, who appeared for the prosecution, said that at first sight the case might appear of little importance, but looking at the facts it would be seen to be most important. Mr. Hereford was a pioneer of motoring in the county, and took proceedings because he was anxious that the facts of the case should be known and act as a deterrent to other boys and persons. If the case was adjourned he could call evidence to show that this boy had been in the habit of doing this kind of thing, and especially of bowling an iron hoop across the road before vehicles, a practice which might cause a terrible accident.

The Mayor, addressing the boy, said that, in view of the fact that this was his first offence and that of his age, the Bench thought the justice of the case would be met on that occasion if they dismissed him, but he would point out to him the seriousness of the offence he had committed, and warn him and other boys against the danger of throwing things at vehicles. Happily there was no accident in this case, but his action of throwing his cap at the car might have been a serious thing. If they dismissed the present case, he must tell him that if he or other boys came up again for such an offence the case would be treated more seriously.

### THE SPEED OF MOTOR-BUSES.

A POLICE TRAP in the Waterloo Road, S.E., led to the appearance at the Tower Court on Saturday of several drivers of motor-omnibuses and electric tramway cars on summonses for driving at excessive speed. Two constables were provided with stop-watches and placed at the ends of a measured furlong. Eight miles per hour was the prescribed limit of speed, but the defendants were alleged to have travelled at between fifteen and sixteen miles an hour. The defendants were each fined 10s. including costs.

The magistrate remarked that electric cars and motor-omnibuses

were heavy vehicles, and were likely to cause great damage when driven at excessive speed, but the defendants were poor men, and therefore he had put the penalties much lower than was usual with owners and drivers of private motor-cars. If, however, the offence were repeated, the penalties would be largely increased. One of the defendants pleaded that motor-omnibus drivers were not provided with speed indicators. The magistrate said he sympathised with the men, and hoped their employers would remedy the deficiency. At the same time, a skilled driver ought to know from experience what pace he was going at.

### PUBLIC MOTOR SERVICE.

**PADDINGTON.**—The general purposes committee of the borough council do not approve of the proposal that the L.C.C. should seek parliamentary powers to run motor-omnibuses as feeders to their tramway system generally.

### ROAD REPORTS.

**COST OF MAINTENANCE.**—In the Municipal Engineering Section of the Sanitary Congress held at Bristol last week, Mr. Fletcher, county surveyor of Dorset, stated that the cost of maintenance of their main roads had been doubled owing to the introduction of motor traffic. Either they must have more financial help from Government or the latter must take the main roads under their control.

**LLANDUDNO.**—The Town Council of Llandudno have decided on applying for a speed limit of ten miles for motors in certain parts of the town.

**WOODBRIDGE.**—Great success is reported to have rewarded experiments in dust prevention on roads at Woodbridge, Suffolk, where a solution of 1 cwt. of calcium chloride to 100 gallons of water was distributed by means of ordinary watering carts.

**MACCLESFIELD.**—As an experiment in the prevention of dust, the Macclesfield Highways Committee have decided to coat several lengths of road in the borough with tar.

**PERTSHIRE.**—The expenditure on the Perthshire roads last year was £8,667, and at the meeting of the Central District Committee of the County Council, the chairman, Mr. R. Gardiner, has been suggesting that the Scottish councils should petition the Government to give additional grants towards the upkeep of the roads.

**SITTINGBOURNE.**—A dust laying preparation has been laid on the road from Station Street to West Street, Sittingbourne.

### THE TOURIST TROPHY RACE.

CAR bodies entered in the International Tourist Trophy race will be required to be comfortably seated for driver and three passengers facing forwards, two in front side by side and two behind side by side; the top of the back of the back seats to be not less than 33 in. from the top of the chassis measured vertically from the highest point of the chassis above the ground behind the dashboard; and shall give, for every two seats, not less than 44 in., measured from outside to outside of the body at the top of the cushion level. This measurement shall be taken along the front of the seats. The platform behind the dashboard shall not be less than 7 ft. 6 in. long, nor less than 32 in. wide, and the body shall cover this area. The body of the car shall be easily removable by undoing not more than six bolts or hinges, and this removal of the body shall not entail disconnecting any part of the ignition apparatus, lubricator connections, fuel pipe work, the fixings of any tank, or any pipe connection to the tank.

### NEW COMPANIES REGISTERED.

**THE PLYMOUTH AUTOMOBILE ENGINEERING COMPANY.**—Capital, £5,000. To acquire the business carried on by Mr. R. F. Davis, at 21, Buckwell Street, Plymouth, and elsewhere, as R. F. Davis, automobile engineer. 21, Buckwell Street, Plymouth.

**MOTOR OMNIBUS MANUFACTURERS.**—Capital, £100. First directors: Messrs. W. W. Challis and M. Townsend.

**TURNER'S MOTOR MANUFACTURING COMPANY.**—Capital, £50,000 (£1). To take over the business formerly carried on by Turner's Motor Manufacturing Company, Ltd. (in liquidation), at Lever Street, Wolverhampton, and to adopt an agreement with the said old company and Mr. W. V. Vale. First directors: Messrs. C. Leveson-Gower (secretary), J. S. Dumbell (chairman), J. B. Dumbell (managing director), and P. St. L. Jepson. Lever Street, Wolverhampton.

**THE AUTOMATIC SPEED GEAR SYNDICATE.**—Capital, £2,000. No initial public issue.

**INDUSTRIAL ENGINEERING AND MOTOR COMPANY, LTD.**—Capital, £50,000.

**WEST YORKSHIRE DARRACQ AGENCY, LTD.**—Capital, £50,000. To carry on the business of motor-car agents, manufacturers and dealers, &c.

**WILKINSON TYRE AND TREAD COMPANY.**—£500. To acquire the business carried on by Mr. C. H. Wilkinson, at Huddersfield, as the Wilkinson Tyre and Tread Company, &c.

### CASES AGAINST MOTORISTS.

*[It must be understood that it would be impossible to report all the cases that are heard every week; we therefore endeavour to give only those which involve points of particular legal importance or of public interest.]*

**IN Haddington Sheriff Court,** before Sheriff Macleod, Mr. Andrew Fletcher of Saltoun was charged with driving his car at twenty-six miles an hour, and also with having failed to stop on being signalled to do so by a constable holding up his hand. Evidence showed that the timing of the car had taken place over only a quarter mile of road by two policemen who had only one stop watch between them, and both were at one end of the quarter mile watching the car coming straight on. The evidence for the defence was that the lifting of the officer's hand, which the police held was a signal to stop, had been regarded by Mr. Fletcher as a salute in passing. His Lordship, in summing up, indicated that more exactitude was necessary in timing a car over so short a distance as a quarter of a mile. He found that respondent had shown that he had not been previously convicted under the Motor Car Act, and that consequently the charge on the first count fell. Had it been otherwise he would have been prepared to hold the count not proven. On the second count, he found that the police had failed to bring home to respondent a knowledge of their desire for him to stop, and, therefore, the verdict on this count would be one of not guilty.

**AT Odiham (Hants)** the Earl of Craven, of Mayfair, has been fined £4 and costs for exceeding the speed limit in a motor-car, at Elvetham.

**LORD MONTAGU OF BEAULIEU** has been summoned at Slough Divisional Sessions for driving a motor-car at an excessive speed. Sergeant Pearce said his lordship drove his car at thirty-eight miles an hour. Lord Montagu said he was driving at nothing like that speed, but the Bench imposed a fine of £2, and costs. There was a second summons

The above illustration depicts the delivery van just supplied by Argyll Motors, Limited, to Price's Candle Company. The engine is a two-cylinder 10-12-h.p., and solid tyres are fitted to the driving wheels.

against Lord Montagu for failing to produce his licence on demand. His Lordship changed his coat and left the licence in the garment he took off. This summons was dismissed on payment of the costs.

**AT Kingston,** Frank A. Short, chauffeur to a Cabinet Minister, whose name did not transpire, was summoned for driving at a speed equivalent to thirty-two miles an hour at Cobham on July 2. Police-sergeant Lucas said a gentleman in the car, who was a member of the Government, remarked that he was in a great hurry, and wanted to get to London soon. It was early in the morning, and the road was clear of traffic at the time. Defendant said the gentleman held a privilege pass, which Superintendent Marks said was granted by the Commissioner of Police, but only entitled the holder to precedence over other traffic. The Chairman: You must pay a fine of £1 and 10s. costs.

**AT the Wokingham County Bench,** T. Stansfield, of 120, Oxford Road, Reading, was summoned for driving a motor-car to the danger of the public, at Finchampstead, on June 3rd. Witnesses gave evidence of the car colliding with a cyclist, and ultimately the Chairman (Mr. Hankey) said the Bench thought the evidence was so conflicting that they felt obliged to dismiss the case. They thought the course taken by the police was quite justified. The defendant must pay the costs of the first hearing (when the case was adjourned at his request).

**GEORGE BALFOUR,** motor-car driver, 33, Westfield Road, Edinburgh, has been charged in Edinburgh Sheriff Court, before Sheriff Maconochie and a jury, with culpable homicide, in that on May 31 he ran down a girl two years of age, and did kill her. After hearing several witnesses the Sheriff interposed and suggested that the Fiscal had not a case. Mr. Renton, Fiscal, said that was his feeling. His Lordship then, addressing the jury, said their duty was a mere formality—to return a verdict of not guilty. To entitle them to return a verdict of culpable homicide it was not enough to prove that the child was killed; they

must prove that the accused person was in fault in what he did. There was no suggestion that the man in this case was driving too fast. There was only a suggestion that he was not keeping a proper lookout. He thought the Fiscal was justified in withdrawing the charge. The jury then returned a formal verdict of not guilty, and the accused was discharged.

Mr. JOHN PHILLIPS, of Windsor, was summoned before the Beaconsfield magistrates on Monday, July 16th, for an alleged offence of exceeding twenty miles an hour (namely twenty-eight miles an hour) at the London road, near Beaconsfield, on June 24th last. Mr. Staplee Firth appeared for the defence, and the Bench dismissed the case. This is said to be the first motor summons that has been dismissed by the Beaconsfield Bench.

### POLICE TRAPS.

A TRAP is in operation at the village just by Norman Cross Hotel. THERE are police traps between Dickleburgh and Scole; Acle and Yarmouth (old road); the second and fourth milestones on the Norwich to Dereham Road; the fourth and sixth milestones, Norwich to Blofield Road, and between the fifth and seventh milestones from Norwich to Cromer.

A POLICE trap in the Waterloo Road is one of the innovations in the Metropolitan police administration.

ON the London road, at Maidstone, is a measured distance of 220 yards.

A QUARTER mile police trap is in fairly constant operation at Stalham, Norfolk.

### MOTOR-CAR ACCIDENTS.

A MOTOR-CAR bearing a London number, journeying from Braemar to Blairgowrie, overturned at the Devil's Elbow, the passengers sustaining severe injuries. They were removed to the Spittal of Glenshee Hotel, where medical attention was given.

THE coroner for the Rape of Hastings has concluded his inquiry into the death of Annie Ransford, who was killed in a motor accident at Cripps Corner, as reported in our issue of the 7th inst. W. C. Sharpe, the driver of the vehicle, which was a 10-h.p. Daimler, was a witness, and said he was told to take a party of nine passengers to Hawkhurst. Some distance north of Sedlescombe, and 1½ miles from the scene of the accident, he stopped the car to pick up an air cap which had fallen from the engine. It was bent and would not fit, so he took it into the car. This cap regulated the supply of air to the engine, and was not material to its running. As he started down the hill where the fatality occurred, he first applied the hand brake, and then the foot brake slightly, both acting effectively. He also shut off the engine, so that the car "free-wheeled" down the hill. There was a slight swaying at first, and later it became more violent. He applied the brakes, and they were acting efficiently, but suddenly the steering-gear locked and the car completely overturned. He could not account for the locking of the steering-gear. He had previously driven the car, but it was not his regular machine. He was not aware how many passengers it was licensed to carry, and was never told. A licence handed to the coroner provided for a load of nine passengers in the car, and he (Mr. Sheppard) remarked that this was a point for the local authorities. Mr. Wild, for Messrs. Skinner and Co., the owners of the car, however, said that there was no offence as it was a private contract. The driver added that his fastest speed was twelve miles per hour, but at the time of the accident it was only eight miles per hour. William Rootes, motor engineer, of Hawkhurst, deposed to examining the car on July 3rd. The foot brake appeared to be perfect, and as the result of a test he found that it would hold the two wheels of the car anywhere. The steering gear was perfect, with the exception of ordinary wear and tear, and every bolt and nut was properly secured. The hand brake was not right. It "held" on the left hind wheel only, and that very slightly, and this was caused by the fact that the "compensation rod" was "rusted up solid." The foot brake, however, was completely adequate. The jury were twenty minutes considering their verdict. Eventually they returned a unanimous verdict that deceased died from injuries sustained by the overturning of a motor-car. They exonerated the driver from blame, and censured Messrs. Skinner and Co., the owners of the car, as they considered that the hand brake was not in proper working order when the car left their establishment. Mr. E. E. Wild said he publicly protested against the rider, Messrs. Skinner and Co. having been censured without their evidence, which was offered, being heard.

At the Westminster Coroner's Court on Monday there was an inquiry by Mr. Troutbeck into the circumstances of the death of William Iveys, of Maddox Street, W., who was killed in a collision between a motor brougham and a hansom cab early on the morning of Friday week last. The driver of the motor brougham, Malcolm Henry Stein, was present in custody of a warder, being under remand from the police-court. After hearing evidence the jury returned a verdict of "Manslaughter" against Stein, who was committed for trial on the coroner's warrant.

WHILE a steam motor-lorry was attempting to descend the steep hill known as Crown Hill, Croydon, the brakes failed to act, and it dashed into a pair-horse brewer's van. The driver was thrown off his dickey and the horses were knocked down. The driver escaped serious injury, but one of the horses had to be destroyed.

As a funeral cortege was about to enter the lych-gate of St. Paul's

Church, Wokingham, a motor-car, coming along the Reading road, ran into it. Mrs. Willatts, an old lady, stepped forward to prevent the coffin and bearers being run down, but was herself knocked down and run over, and sustained grave injuries, which proved fatal.

ON Tuesday night a boy, crossing the road near St. Mary's station, Whitechapel, was knocked down by a motor-car. He was taken to London Hospital in a dying condition.

A MOTOR-CAR proceeding from Twyford Avenue, Acton, into Uxbridge Road, on Tuesday afternoon, dashed into a perambulator which two children were pushing across the road. The children were both badly injured.

### CLAIMS AGAINST MOTORISTS.

THE Court of Appeal has dismissed the appeal of Mr. F. W. Baily from the verdict and judgment given in the trial before Mr. Justice Bigham and a special jury, of the action brought by Mrs. Harriet Norton, widow of Mr. W. H. Norton, for damages for the loss of her husband. Mr. Norton, while cycling near Anerley, was killed by the defendant's motor-car. A coroner's jury found that he met with his death through misadventure, but the claim of the widow was based on the alleged negligent manner in which the defendant's motor-car was being driven. The defendant denied negligence, and pleaded contributory negligence. The jury found for the plaintiff, and awarded her £1,500 damages. The Lord Chancellor, in giving the judgment of the Court, said it seemed to him that the defendant was very much to blame in the whole business from beginning to end, and he desired to say with reference to the defence of contributory negligence that when people were driving either motor-cars or any other kind of vehicle on a public highway it was their duty to remember that deaf people, blind people, nervous people, children, and decrepit old people were quite as much entitled to the use of the highway as they were, and if anyone thought proper so to drive that there was a chance of very serious consequences through a mistake of judgment or misadventure being made by the driver they would have to pay for it in damages.

### APPEAL ALLOWED.

THE Motor Union has again been successful in an appeal they made against the conviction of one of their members by the Belvoir magistrates. Mr. Latham, of Nottingham, was summoned and fined £10 and costs for driving to the danger of the public, and the Motor Union, feeling that the conviction was against the weight of evidence, decided to carry the case to appeal, in which they were assisted by the Notts Automobile Club. The appeal has now been heard at the Leicestershire Quarter Sessions. Mr. Moresby White appeared for the appellant. The evidence showed that Mr. Latham was travelling along the main road between Melton Mowbray and Grantham when he encountered a drove of cattle. The farmer who was in charge of the latter stated that the car was travelling at the rate of thirty to thirty-five miles an hour and that it dashed into the cattle, breaking a leg of one of the steers. Two carters also stated that the car was going too fast, but the evidence of a schoolmaster who was cycling at the spot was to the effect that the speed of the car was only at the rate of twelve miles an hour. This witness also stated that he heard the toot of the motor for some distance before the accident happened, and that the driver never made an attempt to clear the cattle out of the way, as they were scattered all over the road. This evidence was corroborated by the appellant and his wife, and by another gentleman who was in the car at the time. Appellant added that he put on slow speed and one of the animals apparently got trapped in a wheel of the car. The Bench allowed the appeal without costs.

MESSRS. FLEMING AND Co., who are associated with up-to-date tyre repair methods, have removed from Banner Street to 361, City Road, E.C. They have addressed to the Clerk of the Works, St. Paul's Cathedral, a proposal to polish the cross, ball and dome of the Cathedral with their "One Minute" liquid metal polish, which is claimed to give a lasting lustre with the minimum of labour and time.

### TO CORRESPONDENTS.

*All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.*

*The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.*

*The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.*

# THE Motor-Car Journal.

[VOL. VIII.]

LONDON, SATURDAY, JULY 28, 1906.

[No. 386]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

## AN IMPUDENT SUGGESTION.

27, Chancery Lane, London, W.C.,  
July 19th, 1906.

To *Motor-Car Journal*,

Charing Cross Road, W.C.

Dear Sirs,—Mr. Rose, the agent for La Milo, has informed me that you have declined to insert the photograph which he offered you of Miss Montague in her Humber car. I hope therefore that you will be able to reconsider this and make use of the same, as I am putting forward the *M.C.J.* for inclusion in the Humber advertising scheme for next year, and as this is supported by Mr. Johnson, the London manager, there is every likelihood of this going through, and anything like this will, as you will understand, greatly facilitate matters. Perhaps, therefore, you can communicate with Mr. Rose and arrange to get this.

Yours faithfully,

R. T. LANG.  
p.p. B. G.

Replying to the foregoing letter, the proprietors of *The Motor-Car Journal* have intimated to Mr. Lang their surprise at such a suggestion being made to a newspaper of repute.

## COMMENTS.

### A New Competition.

BATH was full of motor-cars on Saturday, and the populace expressed critical delight at the presence of so many specimens of fashionable vehicles. But the proceedings of most interest to motorists were those which took place in the Guildhall, where the General Committee of the Motor Union held solemn assembly. From many points of view the matter of chief concern in the deliberations related to the measures to be taken to assuage the dust nuisance. It was agreed to draw up a scheme for a competition for the best mechanical appliance for the distribution of tar on the roads as a surface coating to combat the dust. The A.C.G.B.I. is to be invited to join with the Union in the matter, and a serious trial of machines should ensue. Such a contest is to be welcomed not only because of its really practical character, but as demonstrating to opponents of motorism the willingness of motorists to initiate and co-operate in any schemes which may render the work they are doing for the country less irksome to dwellers along the highways.

### The Scottish Trials.

THE work necessary to the completion of the report of the reliability trial organised by the Scottish Automobile Club (Western Section) has proved much more laborious than was anticipated, but it is hoped that the report will be available for inclusion in our issue of next week. It is naturally being anxiously awaited—by the public as well as by competitors.

### Privileged Persons.

MOTORISTS subject to the pains and penalties attached to the ownership of cars will probably not be pleased to learn that Cabinet Ministers are said to be exempt from the operation of the Motor Car Act, and that members of Embassies can easily outstrip its enactments. As reported on another page, an Act dating from 1708 has enabled the American Ambassador to escape the legal consequences of speedy travel. Had he been an ordinary person nothing less than a fine of £10 and costs would have assuaged the judicial anger with wrongdoers. The case was a close parallel to the Gurney matter, which occurred in Massachusetts about two years ago. Mr. Gurney, a secretary of the British Embassy, was fined £5 by a local magistrate for exceeding the speed limit in a motor-car, and another £5 for refusing to plead on the ground that he was protected by international law. The magistrate refused to recognise the bearing of international law, and the matter became the subject of diplomatic correspondence. Eventually the fines were remitted and apologies were exchanged, the American State Department, the Governor of Massachusetts, the local magistrate, and the deputy-sheriff who made the arrest all apologising to Mr. Gurney, and Mr. Gurney apologising for having broken the local regulations. That officials of embassies should have special privileges of this kind is anomalous, more especially as they may—we do not say they have—take advantage of the protection thus afforded to travel at speeds which the motorist liable to prosecution would not dare to attain.

### A Complaint from a Motorist.

IN our Correspondence columns Sir John Shiffner, whose interest in motoring is assured by his ownership of cars, gives a specific instance of inconsiderate driving of a vehicle which, we are sure, will be deprecated by all whose have regard to the future of automobilism. In narrow roads, where corners are plentiful and traffic may be about, it is the duty of motorists to drive with particular caution, and when they are called upon to stop, as was the case in this instance, the ordinary courtesy of the road should not be forgotten. Without entering into the merits of this particular incident we would point out to the public that the great majority of motorists are anxious to preserve good terms with everybody, and just as anxious to free the road from the few inconsiderate motorists as are pedestrians and drivers of horses.

### No Longer a Plaything.

A FEW years ago the motor-car was derided as the "plaything of the rich," and there were people ready to denounce it as the sport of idlers or a mere pastime. To-day the motor-bus is assailed by the residents in quiet streets as a noisy, demonstrative kind of vehicle that threatens to "murder sleep" and annoy everyone who happens not to live in a *cul de sac*. It is the utilitarian motor-vehicle that is now the

butt of letter writers, and the *bête noir* of councillors. Sir Theodore Martin can write at leisure against motor-buses, but the man anxious to get to business, and who saves twenty-five minutes in the journey from Putney to the Bank, is scarcely likely to appraise his objections at their real value. The truth is that the motor-bus meets a public want; it is only a question of time ere it is met in a quiet, reasonable, and proper manner.

#### Fleeing from the Noise of the Streets.

MEANWHILE it is interesting to learn that Sir Theodore Martin, having initiated the public discussion on what the papers are describing as the Motor Omnibus Nuisance, has made his customary annual visit to Llangollen—an event that, according to the “Llangollen Advertiser,” is more noteworthy this year than usual, because of the “exceptional reasons that have accelerated his periodical journey to Wales.” Sir Theodore “could endure the noise and smell and vibration of my Onslow Square house no longer,” and so provides our contemporary with a theme that sends the editorial mind into a state approaching the rhapsodical. “It is easily understandable that the environment of his beautiful home on the banks of the Dee, where every association and surrounding tends to the cultivation

Touring in Ireland.—On the Road to Castlebellingham, co. Louth.

Photo by]

[Mr. E. White.

of repose under the most ideal conditions, should prove a delightful haven of refuge from the hurry, the bustle, and the turmoil caused by those who, disregarding so many of the amenities that tend to make urban life endurable, create a condition of things that is a menace to mental peace and physical safety.” But surely it is not heroic to flee from the world of progress, as did the mystics of the Middle Ages. Cannot the famous litterateur stay and incite engineers and others to improve their inventions along the lines of an inodorous quietude?

#### An Indignation Meeting.

WHEN the typical Englishman is dissatisfied with any new developments, or wants to give vent to his feelings with regard to anything in general, the usual way is to hold an indignation meeting and pass resolutions—more or less to the point. This course has naturally been pursued with regard to motor-buses, and a great meeting of the tradesmen in business at Kilburn has been held to consider “the grave and growing menace to local trade caused by motor-omnibuses now running in the High Road, Kilburn.” One speaker propounded as a remedy for the difficulties of life in that part of the world that

motor-buses should not be allowed to follow each other in quick succession; other orators spoke of nerves and noise, sound and smell, and generally indulged in an alliterative flow of words which seemed vague and indefinite. We are afraid that shopkeepers must continue their denunciation until, with the advent of the perfect bus, they realise that the object of their present aversion is a blessing in disguise.

#### The Lords and Motor-Buses.

IN the serene atmosphere of the House of Lords the merits and demerits of the motor-bus have been discussed by noblemen with various qualifications for speaking on the subject. The Marquis of Granby, who initiated the discussion, declared that he did not use the vehicles, “as they never topped for him to get on”; Earl Beauchamp confessed that he frequently used motor-buses, finding them very comfortable and convenient. Apparently the noise of the vehicles was the quality which found most disfavour in the eyes of their lordships, but the difficulty of legislating on that point was set forth by Lord Ellenborough, who said that if it were constituted an offence for a motor-bus to make a noise it would be necessary to provide constables with instruments for measuring sound, because, as soon as a police officer had given his evidence that the noise was very loud some half-deaf old man would come forward and say that it was merely a pleasant hum, which sent him to sleep. Fortunately, Lord Montagu of Beaulieu was able to speak as one having authority, and to assure the House that all the complaints made in respect of smoke, smell, speed and dust were in process of removal.

#### Metropolitan Motorists.

THE formation of an automobile club for the Norwood district of London recalls a complaint which found vent last winter at the dinner of the Southern Motor Club, when regret was expressed at the lack of organisation among the hundreds of motorists in the Metropolitan area. The A.C.G.B.I. is a national asset of the movement and does not specially represent London motorists. But now that clubs are being formed in the various divisions of the Metropolis there is hope that, ere long, a Metropolitan gathering may be arranged on somewhat similar lines to the inter-club meets at Buxton and elsewhere. The Kensington Club has already made itself known to that of Hertfordshire, which, with the North London Club, looks after the social delights of motorists in that direction. The Essex Club represents another important section, and the South London organisation is even more comprehensive, its sphere of influence being, of course, south of the Thames. These, with the Blackheath Club, constitute the nucleus of a great meet of Metropolitan motorists, which would bring home to the people of London the growing greatness of the automobile movement.

#### Speed at Brighton.

*Et tu, Brighton.* Brighton, which has always been so friendly to motorists, welcoming them to its hotels with ready-money hospitality, and even incurring the expense of a legal suit that they might race along the Marine Parade, is now to be invited to declare that within the limits of the borough no motor-bus, motor-car, or any other form of automobile, is to be permitted to travel at a speed of more than eight miles an hour. Councillor Black has given notice that he will move such a resolution at the next meeting of the Town Council, and should it be carried, an appeal for a Local Government Board order of restriction would follow. Is this course necessary? We ask the question because the local hotel proprietors have, in the past, suffered much from the vindictive action of the local authorities, and the police on the road from London to Brighton. They do not want to be further injured by the isolation which might probably follow any ill-advised limitation of the rights and privileges of motorists visiting the town.

### Educational Work.

IN their report to the Motor Union meeting the joint committee of that body and the A.C.G.B.I. give a useful resumé of the work done in the preparation of the motorists' case for the Royal Commission, and rightly paid a tribute to the work of Mr. Rees Jeffreys in connection with securing the evidence and witnesses. Incidentally the occasion was made the opportunity for much educational and propaganda work, which has proved of value in lessening the feeling against motorists in many parts of the country. The circulation of the letter signed by 200 J.P.'s pointing out the failure of the police traps as a serviceable device in securing the public safety was a useful piece of work, as was also the testimony of the medical men. It remains now for individual motorists to continue the good work by considerate conduct when on the public roads.

trials by preventing cars taking part in any such trials from entering or taking part in any competition organised by or held under the auspices of the Club."

### Motorists v. Fruit and Fish.

WHEN motor-cars travel on imperfectly constructed roads their drivers are held up to opprobrium by market gardeners as the destroyers of their fruits, and by cattle-raisers as the poisoners of their flocks and herds. By a process of inductive reasoning Mr. Gardner, of the Farnham Rural District Council, has arrived at the conclusion that their destructiveness does not end there, but that they are responsible for the poisoning of fish in the rivers and other enormities too deep for words. Dust is on the roads, and the motor-cars raise it from the surface; then it becomes irritating and annoying to other people. To

Mr. and Mrs. Percy Barlow on their new 20-h.p. Brotherhood Car.

Mr. Barlow, who is a Justice of the Peace for Middlesex, and member of Parliament for Bedford, is an enthusiastic motorist. He has owned several cars during the last 34 years, his present stud consisting of his new Brotherhood, a Star Landaulet, and a Wolseley.

### Unofficial Trials.

So many unofficial trials of motor-cars, performing various kinds of creditable feats, have lately been reported in that section of the Press designated as "lay" or "general" at automobile dinners, that the A.C.G.B.I. Committee has seen well to adopt a resolution on the subject. At the last meeting attention was drawn to certain unofficial trials which had taken place, and the Committee unanimously agreed that it was unfair to those manufacturers who loyally supported the Club in its endeavours to have all such trials properly observed, for the safeguarding of the public interest, that extensive advertisement should be given to trials where recognised observers were not present. Captain Skeffington-Smyth thereupon moved, Earl Russell seconded, and it was unanimously resolved, "That the attention of those responsible for such unofficial trials be drawn to the following resolution, previously passed by the Committee, to the effect that, having in view the best interests of the public, and having an organisation for the express purpose of checking trials, the Club is taking action to discourage any unofficial

obviate this dust-laying preparations are applied, but these, mixing with the dust, are churned up from the roads, and the tar which forms a constituent element poisons the fish in the streams to which the dust ultimately falls. Such is the process of reasoning which has been luminously demonstrated at Farnham. Apparently the hand of every class of person is to be incited against the motorist; but to attempt to raise the ire of the quiet and patient angler, who is threatened with the loss of his sport, is one of the latest pieces of bucolic impertinence, against which we may well protest.

### An Automobile Museum.

FACETIOUS persons have suggested that a skeleton of a London 'bus horse might be obtained for preservation in the Natural History Museum ere the species becomes extinct. There is an element of humour in the notion—nothing more. A more practical and realisable suggestion is that for an automobile museum, a contribution to which has just been made by Mr. J. H. Knight, who has offered his 1895 car to the A.C.G.B.I.

towards the formation of an historical museum. This offer has been accepted, and it will be stored until a suitable opportunity for display presents itself. It has been proposed that, should it be found impossible to arrange for a special museum for the purpose, some part of the building at South Kensington might be devoted to the purpose. Ere it is too late the matter might well be taken up by the central authorities of the movement and the Government persuaded to recognise the importance of adequately housing any collection showing the progress of road locomotion which private enterprise may gather together.

#### An Australian Reliability Trial.

THE premier automobile event of Australia, the Dunlop Reliability Contest, is to be held this year on Victorian roads. The two previous successful contests were held over the Melbourne-Sydney route, but the wretched condition of the main trunk road between the two capitals renders a change desirable. The forthcoming contest is to be in no way a race, for the speed averages set are well within the powers of the cars in their respective classes. The contest will be held from November 12th to 17th inclusive. The route selected for the trial totals a distance of 1,007 miles, and is one that will appeal to all motorists, as it practically embraces some of the finest roads and scenery in Victoria. The classification of cars will be as follows:—Class A, single-cylinder cars; Class B, multi-cylinder cars, with a cylinder capacity of not more than 130 cubic inches (equivalent approximately to 13-h.p.); Class C, multi-cylinder cars, with a cylinder capacity of not more than 200 cubic inches (approximately 20-h.p.); and Class D, multi-cylinder cars, with a cylinder capacity of over 200 cubic inches (approximately over 20-h.p.) In most particulars the rules and conditions will be similar to those of the recent Scottish Reliability Trial, and a motor-cycle section of the competition may be held over the same course at the same time if sufficient promise of support from motor-cyclists is forthcoming.

#### Motor Picnics

THE motorist who can suggest some new form of entertainment for the delectation of organised motorists will render a service unto all his tribe. The Indian file style of run has had its day; the gymkhana is now at the zenith of its popularity. What next? The innovation of the Motor Cycling Club, with its motor picnics, is something for which we may be grateful, as affording a variant likely to interest motorists and give pleasure to their friends.

#### Inquiry at Stirling.

DANGER signals and symbols of the restriction of motor-car speed to ten miles an hour are prominent features of the Scottish landscape. They are likely to be even more frequent in Stirlingshire if the County Council of Stirling is allowed to have its own way. The General Superintendent to the Local Government Board of Scotland has been holding an inquiry into their application for prohibition of motor-cars on certain roads and restriction of speed on others. Mr. Ballantyne, road surveyor for the eastern district of the county, said he found no necessity to prohibit traffic on any of the roads in his district, having regard to what had been done after the inquiries in Perthshire and Ayrshire. A number of villages, such as Skinflats, Airth, Carronshore, Carron, Stenhousemuir, and Larbert, were scheduled for restriction of speed. There had been immunity from accident in the district, but it was desirable there should be a specific speed limit. Dr. D. R. Cox, road surveyor, central district, spoke to the nature of four roads on which it was proposed to prohibit motor-car traffic. These were the Millhall Road, Cowie Road, Northend Road, in the village of Cambusbarron, and Kippin Road from the station to the village. The closing of these roads was necessary both in the interests of motorists themselves and of the public, and although

no accidents had so far occurred on these roads, it was largely due to the vigilance of the public. Mr. Paul, road surveyor of the western district, deposed to the nature and condition of the roads which it was proposed to close in his district, the principal being the Rowardennan road from the Pass of Balmaha to the inn at Rowardennan. The District Committee had also scheduled all the villages for the lower rate of speed. Several witnesses were examined for the automobile clubs, their evidence being that there was no necessity for the closing of the roads or of imposing a speed limit, Section 1 of the Act being a sufficient protection of the public against reckless driving.

#### The Delivery of Cars.

PITY the woes of the prospective Parliamentary motorist. Just before Christmas last Colonel Lockwood, M.P., ordered a motor-car of French make; delivery was promised for the month of April. The last of that month went by and then the gallant colonel was assured possession in the "merry month of May." But "I have never received it," pleads the patient and long-suffering legislator, "and I am now told I shall certainly receive it in July. I have very little hope." In his tiresome period of waiting Col. Lockwood may console himself with the reflection that he is not alone in his plight. The tale of backward deliveries is almost universal; and, despite the great works that have lately been put up in this country, the demand remains unsatisfied. Those firms that can "supply from stock" are in a decided advantage this season.

THE South Indian Motor Union, of which Mr. F. E. Hooper, 2nd Line Beach, Madras, is the secretary, will hold a 400-mile reliability trial in December next.

FROM the Adams Manufacturing Company, Ltd., we have received a copy of the latest edition of the catalogue of Adams-Hewitt cars. The list has been considerably augmented and revised, and contains many new illustrations, amongst which is that of the new four-seated tonneau car.

AMONG the little novelties which Messrs. G. T. Riches and Company have lately put on the market is a compression gauge. The device, which is fitted with an adaptor enabling it to be screwed into the sparking plug hole, is arranged to indicate pressures from 30 up to 150 lbs. per square inch.

THE second volume of Mr. Worby Beaumont's monumental work on motor-vehicles and motors has been published by Messrs. Constable and Co. The plan adopted in this comprehensive review of automobilism is well known, and the whole work is likely to long remain the standard book of reference on the technical aspect of automobilism.

FROM the Electric Ignition Company, Ltd., of Sparkbrook, Birmingham, we have received a copy of the new catalogue of the E.I.C. "Ignitalities." The list is very complete, extending as it does to about fifty pages. Full particulars are given of the various ignition specialties of the company, including the well-known E.I.C. sparking plugs, induction coils, accumulators, charging sets, switches, contact breakers, high tension distributors, &c.

MESSRS. J. AND R. OLDFIELD, of Warwick Street, Birmingham, have issued an effective brochure giving the opinions of users of their "Dependence" rear lamp, which has the advantage of possessing a simple means by which the driver can satisfy himself that the lamp is in order, a brilliant ray of light being projected on the off-side of the car. There is no danger of the reservoir becoming detached, while experience has shown the immunity of the device from the effects of vibration.

THE Hull City Garage, Ltd., has opened a garage at the city end of Beverley Road, with accommodation for seventy cars and ample facilities for the repair of vehicles and storage of petrol, &c. Mr. C. T. Wade is the managing director of the new garage, with Mr. H. D. Smith as works manager. Col. Dibb, J.P., the chairman of the undertaking, presiding at the opening ceremony—the Mayor declared the garage open—said that police traps afforded no protection to the public, a view generally held by motorists, but not so common among J.P.'s.

## The Motor Union at Bath.

THE meeting of the Motor Union was held on Saturday at the Guildhall, Bath, with the Hon. A. Stanley, M.P., in the chair, supported by Earl Russell, Messrs. L. de Rothschild, Staner and Siddeley (A.C.G.B.I.); Messrs. Granville Kenyon (Kent), Charles Hardy (Notts), J. A. Morris (Manchester), Alan McAlfin (Leicester), J. C. Reeves (Kensington), Charles McWhirter and N. B. Kenealy (Hertfordshire), Arthur Dale (Bristol and Gloucestershire), Shrapnell Smith and Douglas Mackenzie (Motor Van and Wagon and Omnibus Users' Association), Frank Briggs (South Devon), Scrace Dickins (Sussex), J. Thompson Willows (South Wales), W. L. Lorkin and T. W. Maynard (Southern Motor Club), C. Rippon (Oxford), Ballin Hinde (Midland), A. Armitage (Somerset), Robinson Smith (Bucks), Captain Owen (Sonning), T. W. Staplee Firth, solicitor to the Union, and the secretary, Mr. W. Rees Jeffreys.

One of the first matters for discussion related to the dust question, and it was decided to hold a competition for the best mechanical appliance for the distribution of tar on the roads. Two prosecutions were ordered to be undertaken, one against the driver of a gig for an alleged assault on a motorist, com-

of the Commission's report, but the committee think that one further useful service could be discharged by them before they cease to exist. The report, whether in the main favourable or unfavourable to automobilists, will require careful examination and review. The committee therefore propose, upon the issue of the Commission's report, to prepare a pamphlet examining its proposals for general circulation. In that pamphlet they will include some of the evidence that they have collected, so that that document itself will state the case for automobilism, and will be in such a form that it is hoped that it will be of great value to the discussion which will take place in Parliament and the country when the Government introduces the next Motor Car Bill.

Early in the afternoon the cars left Bath for Longleat, where, by the invitation of the Marquis of Bath, a hill-climbing competition, organised by the Somerset Automobile Club, took place. Every car had to be of the tourist type, and had to carry its full complement of passengers of an average weight of 140 lb. No cars that had competed in an open racing competition in the years 1903-1906 were eligible. Details of the contest appear on page 476.

The Longleat Hill Climb. A competitor rounding the sharp bend on the course.

mitted near Ashford, Kent, and the other against a driver of a four-horse wagonette for obstruction at Epping. A number of applications for legal assistance were considered, and grants aggregating to over £120 were made. It was also resolved to pay the expenses of a test case which had been heard in Staffordshire, as to whether motor-cars are subject to local lighting by-laws, as well as the special lighting regulations laid down in the Acts and Orders governing motor-cars. The committee instructed the insurance committee to bring up a scheme for the insurance of the motor-cars of members. It was reported that the New Forest and Bournemouth A.C. had joined the Union, the membership of which includes 65 clubs and an aggregate strength of 12,500.

The report of the Joint Committee of the Automobile Club and the Union to collect evidence for the Royal Commission on motor-car traffic was presented, in which a record of its work was given, together with some references to the position in and out of Parliament. The present Parliament is far more sympathetic to automobilism than the last, and the members, as a body, appreciate to a greater degree the great advantages to the country of the encouragement of the power vehicle. The labours of the joint committee which was appointed to collect evidence for the Royal Commission technically end with the publication

In the evening a dinner was held at the Pulteney Hotel, Bath. After the loyal toasts, the Chairman (Sir A. A. Hood, M.P.) proposed "The Motor Union of Great Britain and Ireland," and as a Somerset man gave the members a hearty welcome to the county. From various causes, and partly owing to the enterprise of people abroad, the English makers did not get off first for the motor-car building trade, but our countrymen were making up that lost ground rapidly. Speaking as one who lived in, perhaps, not a typical motoring county, but a very difficult one, he thought the great thing they had to aim at in this part of the world was not speed only, but reliability, economy in the use of petrol, &c., and hill-climbing. He had had some experience, and he preferred a reliable car that would take him up a hill to a very swift car which was not so certain. Without wishing to touch upon politics, Sir Alexander said that in the recent election friends in the Motor Union provided him with sixty-five cars. They had many difficulties to deal with in this country with regard to motor-car traffic—everybody wanted a good road to drive upon, everybody who lived by the roads wanted a dustless road. It was fairly easy where they had a rich and dense population to get local help to make the roads dustless and smooth, but in the interests of the motor-car industry and of motor-cars he did not think it was a wise policy

to ask ratepayers to spend more money on the roads. In rural districts rates were fairly high now. But we wanted well-made roads, and he did not think the present system of making them was efficient or economical. As regards dust, they must leave it to the ingenuity of manufacturers to prevent motor-cars from scattering dust.

The Hon. Arthur Stanley, M.P., responded. Commenting upon the great change that had taken place in the attitude of the House of Commons towards motor-cars, the speaker said he believed it was due to increased education—in other words, to members having found out their value at the last election. As to the Chairman's remarks about roads, he might remind him that last year he introduced the Roads Bill, which embodied the principles Sir Alexander advocated. He believed it was perfectly possible, without increasing the rates or taxes, by an improved system of administration by a central department, to make the roads equal to the traffic now put upon them. Those gatherings at various provincial centres were of the utmost value not only to motorists but to all other people concerned, and it was good for those centres, for it enabled them to see a hundred or so cars coming into a town and going back without causing a single accident.

Mr. J. A. Morris, Chairman of the Manchester Automobile Club, gave the toast of "The Somerset Club," and spoke in high terms of the secretary, Mr. Armitage, and the committee, to whom the thanks of the Union were due for the successful way in which that day's proceedings had been arranged. The Somerset Club had a membership of 120, which was very good considering that it was a youthful club of two years' standing.

Mr. A. Armitage, in returning thanks, attributed much of the success of the day to the committee, who had worked hard and willingly with him. They were very slow in Somerset and always about 100 years behind the times, and he wished there had been more members to meet them, but what they lacked in quantity they, of course, made up in quality. The Somerset Club was a young and thriving club; they had a large county but a small population. Since the Motor Car Act had been passed he believed he was correct in saying that they had not had a single police trap set in Somerset. The Chief Constable and all his subordinate officers in the constabulary, as those who had toured in the county would agree, never failed to show the greatest courtesy, and the same remark could be applied to the police in the city of Bath.

Mr. W. Rees Jeffreys, the secretary of the Motor Union, proposed "The Marquis of Bath, the Mayor and Corporation of Bath," and his worship, in reply, regretted the absence of the Marquis of Bath, and thanked the Motor Union for visiting the city and showing the inhabitants that it was possible to have motor-cars absolutely noiseless and also with an absence of smell. What they saw most of in Bath were the motor-buses. The remaining toast, that of "The Visitors," was submitted to Mr. R. A. Sanders, Mr. G. T. Langridge responding.

MIDLAND motorists interested in the associations of Dr. Johnson with Lichfield will appreciate a booklet issued under the auspices of the local Tradesmen's Association by Mr. E. J. Burrow, of Cheltenham. There are many beautiful drives and walks in the locality, among others to the Beaudesert, the seat of the Marquis of Anglesey, and to Drayton Manor, the home of the great Sir Robert Peel.

AN interesting new model has just been brought out by Argyll Motors, Ltd., in the shape of a combination touring car and delivery van. Although the design is quite new, the company have already received several orders and a large number of inquiries, which go to show that such a vehicle is much needed amongst the mercantile community, who can use the van for business purposes and the open car for pleasure. The work of conversion from one form to the other occupies only a minute or two, the removable portion being secured by four bolts. Either as a van or as a car the vehicle is complete in every way, nothing having been sacrificed in making it convertible.

## CONTINENTAL NOTES.

### Motor Speed in Munich.

The police authorities of Munich have issued a warning that severe measures will be taken against motorists who drive at excessive speed through the streets of the town to the danger of ordinary traffic. The owners of cars caught travelling at a speed exceeding ten miles per hour are to be punished with imprisonment.

### The International Motor Cycle Cup Race.

The English delegates, supported by those of France, have entered a protest against the Austrian riders in the International motor-cycle cup race, on the ground that they were followed round the course by riders with spare parts, in direct contravention of the rules which provided for repairing and replenishing stations. The matter has been referred to Baron de Crawhez for independent arbitration, and until his decision is made known the official result is being held in abeyance.

### The Ostend Automobile Week.

The automobile meeting at Ostend was brought to a close on the 17th inst. by a trial of touring cars over what is known as the Littoral circuit, which takes in Blankenberghe, Bruges, St. Andre, Westkerke, and Snaeskerke, and which had to be covered six times, giving a total of 250 miles. Twenty-seven cars took part in the event; the best time (4 hours 45 min.) was made by Mr. Lee Guinness on a 60-h.p. Mercedes. The T'Serclaes Cup, offered to the car making the fastest aggregate time in the kilometre, mile, and five kilometres speed contest, was awarded to Mr. A. D. Grigg, who drove a 35-h.p. Daimler.

### The Belgian Criterium.

The 1,000-kilometre reliability trial for touring cars, known as Le Criterium, and held under the auspices of the Belgian, Spa, and Namur and Luxembourg automobile clubs, started on Saturday last. The competitors are divided into three classes, the first of which will be subdivided into six categories as follows:—

Class I. Category	Max. total Piston Area.	Equivalent Bore.		Mean Speed to be attained.
		cyls.	Max. Bore mm.	
1	cm <sup>2</sup> . 113,097	1	120	20
2	226,194	2	120	25
3	283,530	4	95	30
4	346,360	4	105	30
5	490,876	4	125	30
6	615,753	4	140	30

The competitors in Categories 3 to 6, in addition to the five days' tour outlined below, will be required to take part in a 500 kilometre race on the Circuit de la Meuse, while for those in Categories 1 and 2 there will be a hill climb at Spa on the 27th inst. Class II. is for cars entering for the five days' tour and the hill climb but not the race, while Class III. is for competitors willing to enter the five days' tour, but covering the same at any speed they choose, the only obligation being that they submit to official control when starting and on arrival at their destination. No less than 76 entries had been received. Of these 47 were duly weighed in on Friday last week, they comprising the following makes:—Aries, Darracq, Pipe, Fiat, Gobron, Miesusset, Ruhl, Metallurgique, Locomotrice, Vivinus, N.A.G., Germain, Vulpes, Hurtu, Benz, Mors, Martini, Imperia and De Cosmo. The first day's run was from Spa to Nimegen, a distance of 186 kilometres, M. Kinet, on a Pipe, being the first to be despatched at 8.30 a.m., the others following at minute intervals. On Sunday, the 22nd inst., the journey was continued to Cologne, 170 kilometres, 44 of the competitors safely reaching the cathedral city. Luxemburg, a distance of 210 kilometres, was the destination on Monday; Rheims, 226 kilometres, on Tuesday; and Dinant, 150 kilometres, on Wednesday.

### A Bavarian Touring Contest.

The Bavarian Automobile Club is organising a reliability trial for touring cars to be held on August 17th, 18th and 19th. On the first day the run is from Nuremburg and back, *via* Kissingen, a distance of 312 kilometres; on the second, from Nuremburg and back *via* Regensburg, 223 kilometres, while on the third day there will be a floral fete.

### The Florio Cup Race.

The Sporting Committee of the Italian Automobile Club has decided that the Florio Cup race, to be run off on the Brescia Circuit on September 2nd, shall consist of twelve laps, giving a total of 732 kilometres (457½ miles). Elaborate preparations are being made for the event, and it is expected that there will be over forty competitors, including all the principal makers of France and Italy. As we go to press we learn that the race has been suspended owing to the refusal of the Italian Minister of War to supply the troops necessary for guarding the course.

### The Boulogne Automobile Meeting.

An automobile meeting took place at Boulogne-sur-Mer last week, under the auspices of the Boulogne section of the Automobile Club du Nord. A gymkhana was held on the 19th inst., when the first prize was won by M. C. de St. André on a 35-h.p.

on a 100-h.p. Darracq, and Cecil Edge, on a 90-h.p. Napier. The former won easily in 17 3-5 sec., as against the latter's 35 3-5 sec.

### The German Motor Volunteer Corps.

About fifty members of the German Volunteer Corps will, it is expected, take part in the military manoeuvres to be held in Silesia in the autumn.

### Public Services in Germany.

Negotiations are in hand for the establishment of a public motor-car service between Dürkheim and Ludwigshafen. The municipal authorities of Dusseldorf have voted a sum of £2,500 towards the establishment of a motor-bus connection between that town and Hamm.

### Motor Racing in Russia.

A motor race over a distance of 100 versts on the Tsarskoie-Selo-Gatchina road took place recently. The best time was made by M. Farrigh on a 15-25-h.p. Brasier, who covered the distance in 1 h. 36 min.

### Industrial Motor Vehicles for Spain.

Senor Alvarez, Secretaire Sub-Commission F.C.S., M.C.P. et Ouest de l'Espagne, Gare Delicias, Madrid, informs us that his

The Boulogne Speed Trials.—M. Capdeville on his 12-h.p. Unic Car.

Gobron. On Friday, the 20th inst., there was a series of events for the Leopold II. challenge medal. The cars were first submitted to a kilometre hill-climb in the Forest of Boulogne from a flying start, the best time being made by M. Franchomme on a 100-h.p. Darracq (38 1-5 sec.). This competitor was also the winner of the flying kilometre speed trial on the level in 31 4-5 sec., and of the kilometre (standing start) on the Tingry hill, about eighteen kilometres from Boulogne, the time in this case being 59 sec. In making the awards the times of the three trials were added together, with the following results:—

			Min.	sec.
Cars up to 10-12-h.p. ...	Bonté ...	10-h.p. Clement	4	9
		Bayard		
Cars up to 12-20-h.p. ...	Bathiat ...	18-h.p. Peugeot..	3	24
Cars up to 20-30-h.p. ...	Lattune ...	24-h.p. Cottin	3	7
		Desgouttes		
Cars over 30-h.p. ...	Franchomme ...	100-h.p. Darracq	2	9

The De Caters Challenge Cup, which was contested in 1904 and 1905 on the Doullens Hill over a distance of 500 metres, flying start, and was secured in the first year by Wagner, on a Darracq, and last year by Hanriot, on a Bayard-Clement, was also held during the day. There were only two competitors—Wagner,

company contemplates the establishment of one or two motor-vehicle services for the transport of both passengers and goods, and that he will be pleased to receive particulars of such machines, together with any information with regard to the cost of operation of the same.

### Miscellaneous Items.

An automobile flower fete is to be held in Baden-Baden on August 29th next.—The Paris *Salon* is to be held from the 7th to the 23rd December next, and not in October, as has been incorrectly reported in some quarters.—The Michelin Company, of Clermont Ferrand, has just issued the 1906 edition of its "Guide to France," an indispensable work to all motorists touring in the country.—On Sunday next, the 29th inst., the Automobile Club Bourguignon will hold a hill-climbing competition on the Val-Suzon hill, near Dijon.—The Allgemeine Motorfahrer Verband of Vienna is organising a competition of motor-bicycles with side car attachments for the 29th and 30th inst. On the first day the run is from Vienna to Gratz, and on the second the return trip to the capital will be made, the total distance being about 250 miles.

## MOTOR 'BUS BRAKES.

THE recent serious motor-'bus accident at Handcross has caused the question of the brakes on such vehicles to come into special prominence, and we learn that the Ryknield Motor Company, Ltd., of Burton-on-Trent, have decided to fit to their latest type 40-h.p. 'bus, in addition to the two ordinary brakes which are under the driver's control, an entirely independent one worked by the conductor. This will

Arrangement of Ratchet-Gear for Rear Road Wheel Brakes of Critchley-Norris Motor-'Bus.

be a screw brake of the most powerful description acting directly on the road wheels, and it will be actuated by a hand wheel placed near the foot of the staircase. The Critchley-Norris Motor Company are also fitting their motor-buses with a special form of hand-operated brake acting on drums on the rear road wheels. The arrangement is such that there is practically no limit to the power that may be applied, and it is quite possible to hold the 'bus by the hand-brake alone on the very steepest grade with full load. Referring to the accompanying drawing, A is the hand-lever, which, in order to apply the brake, is pulled towards the driver. This lever carries a pawl B, which engages in a ratchet wheel C; the latter is fixed to a shaft which carries a lever coupled to the brakes on the back wheel. D is a trigger for lifting the pawl out of engagement. In pulling over the lever A the pawl B engages with the ratchet wheel C, and the shaft to which it is fitted, thereby putting on the brake. If at the first pull over of the lever A the brake is not on sufficiently hard, the pawl B can be lifted by the trigger D, the brake being held on by the pawl E. The driver can now push the brake lever forward and pull back again, when the ratchet wheel is moved a further distance and the brake is applied harder. In order to take off the brake the pawl E is released by the pedal G, and the pawl B lifted out of engagement by the trigger D.

SOLID-DRAWN weldless tubes for motor-cars, &c., lubricators, oil cups, &c., are illustrated in the new list which Messrs. John Spencer, Ltd., of Wednesbury, have issued.

THE 1906-7 catalogue of the London Autocar Company, 182, Gray's Inn Road, London, will be of special interest to those in the trade, and to garage proprietors, as well as to motorists on the look-out for spare parts, &c. In electrical accessories the list seems comprehensive enough for all practical purposes, and indicates the firm's facilities for supplying motorists.

## A NEW MOTOR HANSOM.

A DEMONSTRATION was given in London on Friday last week with a new motor-hansom which has been designed by the Pull-Car Motor Company, of Preston. We give an illustration of the vehicle herewith, and may explain that it is built up of two parts, the forward one of which carries the engine and transmission mechanism as well as the driver's seat and steering gear. The rear portion consists of an ordinary hansom cab body, the idea of the firm in designing the *avant-train* or motor fore-carriage being that of introducing an arrangement which can be readily adapted to existing forms of horse-drawn vehicles, so converting them into automobiles. The fore carriage comprises a short frame, to which is fixed, under the driver's seat, and at right angles to the usual position, a Fafnir 14-h.p. four-cylinder engine. The crank shaft is extended on one side, and carries near the end a chain wheel, on which works a Renold silent chain to convey the power to the intermediary shaft on which the change-speed gear is mounted. The latter is of the epicyclic type so largely used on many American cars; it is adapted to give two forward speeds and a reverse, controlled by pedals. The final drive is by a single centrally-located chain working on to the front axle, which is of special design to allow the forward pair of road wheels to act both as steers and drivers. The latter are shod with pneumatic tyres, while the rear pair are the ordinary solid-tyred wheels fitted to hansoms. Although these give the Pull-Car a somewhat novel appearance, their large diameter undoubtedly adds to the easy riding qualities of the vehicle, which in the course of a trial run along the usually bumpy Embankment proved most comfortable. The motive power being applied to the front wheels instead of the rear, as usual, is claimed to obviate all tendency of the car to side-slip, while another point is its ability to turn in a small circle—both desirable features in cab work. We understand that the Scotland Yard authorities have submitted the new motor-hansom to exhaustive trial, and, while desiring certain slight modifications as regards the brakes and size of the body, have approved the

general design, so that work is to be pushed on with the object of putting a number in service in the Metropolis at an early date.

THE fourth edition of the catalogue of Messrs. Van Raden and Co., Ltd., issued this year, has just been received from Coventry. Previous reference has been made to the comprehensive character of the list. Suffice it now to say that the firm have opened London offices at 8, Cecil Court, Charing Cross Road, where many of their electrical specialities may be seen.

LORD LONDESBOROUGH has just taken delivery of a 28-h.p. Daimler brake from The Motor House.

SOME farmers are declaring that, owing to the dust raised by motor-cars settling upon grass, it now takes a man two days to cut an acre with a scythe, whereas it only took one before motor-cars came into existence.

At the exhibition in connection with the Sanitary Congress at Bristol a bronze medal was awarded to Messrs. Wilson and Stockall for their motor ambulance.

A FUND for the relief of the distress caused by the motor-bus accident at Handcross has been opened. The bankers are Messrs. Martin and Co., Orpington, and the Kent Automobile Club has subscribed ten guineas to the fund.

UNDER the managing directorship of Mr. O. F. Mandy the British Bariquand and Marre Engine Company, Ltd., have opened a depot and show rooms at 10, Poland Street, London, W., for the sale of Barriquand and Marre petrol engines and motor components.

THE Sirdar Rubber Company have removed their head offices to 34, Baker Street, W. Wheels should, as before, be sent to the works at Shirland Road, Paddington, W., for tyreing and re-tyreing, as well as to the company's various depots in Dublin, Glasgow, and elsewhere.

At the recent Bisley camp one of the features of the busy scene was the motor accessory supply tent established by Mr. H. Quartermaine, of Woking, where he has two garages—one in Chobham Road and one in Chertsey Road—capable of accommodating from sixty to eighty cars.

THE value of the motor-cars and parts exported from the United States during May last is returned at £96,908, as compared with only £58,336 in the corresponding month of 1905. Of the total England is responsible for £27,621, and Canada £24,031, these being the two principal outlets for American automobile productions.

DURING the year ending March 31st the following registration work was done by the County of Essex registration authority:—Number of motor-cars registered, 196; motor-car transfers, 86; motor-cycles, 324; motor-cycle transfers, 185; motor-cars (heavy), 19; manufacturers' numbers, 9; driving licences, 1,172; driving renewals, 1,208; driving duplicates, 50. The fees amounted to £951 5s.

FROM 532, Oxford Street, W., comes a list of motor clothing and accessories stocked by Automobilia, Ltd. Among the garments for motorists are several new fashionable designs, and the stock of leather liveries is extremely comprehensive. Horns, lamps, tools and tool kits, jacks, pumps, &c., are all included in this new catalogue, which demonstrates the facilities that Automobilia possesses for meeting the requirements of motorists of all degrees.

MOTOR garages will be found at most of the principal hotels in Scotland, including the Portpatrick Hotel, the Fiebarachan Hotel, Aberfoyle; the Woodside Hotel, Doune; the Central Hotel, Edzell; the Commercial Hotel, Kirkcudbright; Kusack's Marine Hotel, St. Andrews; the Station Hotel, Oban, which has a first-rate inspection pit; and the Palace Hotel at Aberfeldy, near the scene of one of the hill-climbing competitions in the Scottish Reliability Trial of last year.

WE have had submitted to us recently by M. J. Agesilas, of 37, Barbican, London, E.C., samples of a new alloy he is introducing. It is known as "Fortior," and is stated to consist of a mixture of copper and aluminium with a few thousandths of other elements. Tests carried out with the alloy in the Laboratory of the Conservatoire National des Arts et Metiers, in Paris, show it to have a melting point between 1,010 and 1,030 deg. C. and that when heated up to between 690 and 730 deg. C. and tempered in water it possesses noteworthy properties as regards elastic limit and breaking load. The alloy is well adapted for use in many different parts of petrol engines and motor-cars, and as it can be forged as readily as iron and steel, is well worthy of the attention of automobile engineers.

## HERE AND THERE.

MESSRS. F. CLEAVER AND Co. have a motor garage and accessory store in West Street, Sittingbourne.

BEFORE the Recorder of London (Sir Forrest Fulton), on Tuesday, William Keen (26), engineer, was sentenced to twelve months' hard labour for obtaining two motor-cars by false pretences.

MESSRS. MILLS AND IVES have opened a garage and repair shop in Queen Victoria Road, Coventry. It is on the main road from London to the north.

WE learn that Mr. G. S. Bowles, M.P., has just placed an order with Messrs. Dean and Burden, Bro., Ltd., for a 25-30-h.p. six-cylinder "Scout" landaulet.

A NUMBER of medical men who motor met on Thursday of last week at Brant Broughton, on the invitation of Dr. Percy and Mrs. Sharp, who annually entertain their motoring medical friends.

MR. H. W. SOUTHALL, JUN., of Union Passage, Birmingham, has lately brought out a new tyre inflation gauge, of which we give general and sectional views herewith. The device is intended to supersede the ordinary pressure gauges attached to pumps, which frequently only register the pressure of the air passing through the inflator tube to the tyre, which is often considerably more than is actually in the latter. The Southall gauge, which is supplied in a strong leather-covered and lined

Fig. 1.—General View.

Fig. 2.—Sectional View.

box, consists of a union A, which fits on the tyre valve G, and a screw piece B on which the pump is fitted. This is set at an angle, enabling the pump to be screwed on more readily than on the valve direct. A two-way cock G, when at position D, allows air to pass from the pump B to the tyre; at the same time it cuts off the gauge H, which is thus not strained at each stroke. To read pressure in tyre the cock has to be in position E, which cuts off the pump B, and by turning the thumbscrew F the pin in the valve G is raised from its seating and a perfectly free passage is provided from the gauge to the inside of the tyre. If the pressure is found not to be sufficient, the thumbscrew must be turned back, the cock placed at position D, and more air pumped in.

THE returns issued by the U.S. Bureau of Statistics of the Department of Commerce and Labour for the fiscal year ending with June show that the automobile industry has broken all previous records. Approximately, cars to the value of £800,000 were imported into the United States during the year, £600,000 worth exported, while the output of home manufacturers amounted, roughly speaking, to £5,200,000. In its industrial effect upon the country the importance of the American automobile industry is keeping pace with its financial growth, as is shown by the census returns, the number of wage-earners employed having risen from 2,242 in 1900 to 10,239 in 1905. The gross outlay in wages has developed from £264,130 to £1,235,790 during the same interval.

THE Grand Duke Alexander of Oldenburg has acquired a 40-h.p. Benz car.

Two of the three candidates at the Cockermouth bye election are members of the A.C.G.B.I.

AMONG the contributory causes of his financial embarrassment, a Rochdale tanner assigns the popularity of the motor-car.

THE address of the London office of Mann's Patent Steam Cart and Wagon Co., Ltd., now is 9, Fenchurch Avenue, London, E.C.

A SINGLE-DECK petrol-electric 'bus of the Auto-Mixte type, with nineteen passengers, was successfully driven down Handcross Hill on Friday last week without the use of the brakes being resorted to.

MR. J. A. RYLEY, of 23½, Martineau Street, Birmingham, will forward to applicants a copy of his splendid show card of the "Vita" plug. He has just obtained a considerable order from abroad for these well-known plugs.

MESSRS. GALL AND INGLIS have issued another of their "Strip" Motor Maps, this dealing with the Midland Road, and giving intermediate distances as well as useful notes on the character of the roads between various places.

MESSRS. R. AND J. PULLMAN, LTD., of Godalming, possess experience of motoring with a knowledge of the leather trade that

has been well combined in the manufacture of a non-skid band of considerable merit. Their new type is detachable, and by creating a constant circulation of air between the band and the outer cover tends to reduce the temperature of the tyre. It yields readily to impact with substances on the road, and altogether possesses many points of excellence. The detachable non-skid consists of sections of leather, studded with steel rivets, which cover the surface of the tyre, and are attached to two chains following the circle of the rim, which allow the device to creep slightly on the surface of the tyre beneath. Contrary to what might be imagined, stones and grit do not work in between the band and the tyre below it; in fact, the band takes the entire rub of the road, and protects the rubber to a really remarkable degree,

which, in a practical test extending over many hundreds of miles, remained quite uninjured. Messrs. R. and J. Pullman are anxious for all motorists who want a really practical detachable non-skid to test this new type for themselves.

MESSRS. DURHAM, CHURCHILL AND CO. have recently obtained an order from the Sheffield Corporation for a 15-cwt. chain-driven delivery vehicle. It will be fitted with a 20-h.p. four-cylinder motor and 32 in. road wheels shod with twin 2½ in. Sirdar tyres at the back, and single 3 in. in the front.

MESSRS. LEGROS AND KNOWLES, LTD., have entered three Iris motor-boats for the Motor Yacht Club's Reliability Trials to be held at Southampton on August 1st and 2nd. Two of the vessels are fitted with the standard 24-h.p. Iris marine set, the engine comprising four cylinders, 4½ in. bore by 4½ in. stroke. The third is a lighter and faster boat, fitted with a 35-h.p. light marine set, the engine having four cylinders, 5 in. bore by 5½ in. stroke, running at 900 r.p.m.

THE fact that it is now in a third edition is testimony to the high opinion which the public has formed of Pitman's "Business Man's Guide," by Mr. J. A. Slater, and published by Sir Isaac Pitman and Sons, Ltd. It is really an A B C of business, a repository of commercial information, arranged in an easily-accessible form. The French, German, and Spanish equivalents of some English commercial terms and phrases are given, and the volume will be found useful in every office.

AN Argyll car has, for the third time in succession, gained first prize and gold medal at the Wirral Agricultural Show.

MOTORISTS travelling in Scotland will find the guides and time tables of Messrs. W. Macdonald and Co., Ltd., reliable and useful companions.

MESSRS. MARK MAYHEW AND CO., of Battersea, are announcing a sale of horses, being about to increase the number of motor-vehicles in their service.

OF the two 12-16-h.p. Clement-Talbot cars, that fitted with Palmer cord tyres gained the highest marks out of the sixty-four petrol cars which competed in the South Harting Hill Climb.

THE Immisch Launch and Boat Company, Ltd., has issued a catalogue of the motor-boats launched from its headquarters at Platt's Eyot, Hampton-on-Thames. The drawings and descriptions afford full information to intending motor-boatists.

MOTORISTS familiar with the early days of the automobile movement will regret to hear of the death of Mr. Roger H. Fuller, who did much for the industry when the car was less popular than now. The funeral took place on Friday of last week, at Surbiton.

MR. EDWARD ARNOLD'S "Wallet" series of handbooks fills a place in public requirements, and the little book by Mr. H. R. Reynolds included therein has interest of a general character. It is concerned with "Motoring for Moderate Incomes," and attempts to be of service to those who can afford the initial expense of £500 for the car and £100 per annum for upkeep. Hence its value to the public.

COLLISIONS between motor-cars and railway trains are, fortunately, not of frequent occurrence. One took place the other day at Woodville Road Bridge, Cardiff, where the Taff Vale Railway has erected a platform and instituted a service of motor-cars between that point and the docks. A motor-car was standing at the platform, partly under the bridge, when an engine with a tender and brake-van, the latter being in front, backed into the car, which was considerably damaged.

WE have just received a copy of the latest retail motor catalogue issued by Messrs. Brown Bros., Ltd., which is certainly one of the most comprehensive lists of motor goods published. The volume is strongly and tastefully got up, and contains about 150 pages of illustrations, including every article the motorist will want, no matter whether it is a car, motor-cycle, or the smallest accessory. All articles are numbered and priced out at the end of the catalogue, by which means one can see the price of practically every article at a glance without wading through pages of illustrations.

THE "Continental" Handbook for Automobilists has just been published. The work, which is of the greatest value to all motorists throughout the United Kingdom, contains amongst other subjects the following:—Speed tables, legal information, list of automobile clubs; hints on the cleaning and care of cars, as well as the clothing of the motorist, tyre manipulation, railway and steamer freights, European frontier regulations, automobile terms; alphabetical list of towns, with particulars of oil and petrol depots, repairers and garages, and other useful information, including a large road map of Great Britain. The Continental Tyre and Rubber Company (Great Britain), Ltd., will be pleased to forward a copy of this guide to any reader on receipt of sixpence in stamps to cover the cost of postage and packing.

THE Albany Engineering Company, which has removed into new works at Ossory Road, Old Kent Road, London, S.E., has sent us a copy of the new catalogue of Albany circulating pumps. These have already been described in the *M.C.J.*, and their many advantages have secured for them a large adoption by motor-car manufacturers for water-circulating purposes. The Albany Company are also now drawing attention to the utility of the pumps in connection with forced lubrication, by means of which oil is supplied to all essential points which cannot be reached by gravitation and the ordinary oil-can, thus preventing wear, saving the cost of repairs, and also a great amount of power. We may add that the ¾-in. size, which has been adopted by several leading manufacturers, weighs only 3 lbs., and works against a pressure of 200 lbs. per square inch.

## SOME CURRENT TOPICS.

### The Horse-power of Motor-cars.

In connection with the remarks on this subject which appeared in the last issue of the *M.C.J.*, Mr. John S. Napier, of the New Arrol-Johnston Car Co., Ltd., writes as follows:—"I am of opinion that the solution suggested by the Germans is as far from the correct solution as ever, as by it an assumed speed of engine is taken—900 revolutions per minute—which makes the formula work out to the advantage of the cars with fast-running motors. It seems to me that one of the simplest and most nearly approximate methods of estimating horse-power for hill climbs or other competitions is to take the volume swept out of the cylinder per minute during the trial. This might be obtained by having a revolution counter attached to the engine, which

definite figure can be obtained, by which the relative merits of all cars can be accurately compared. I should be very glad to see the A.C.G.B.I. adopting such an arrangement, and I feel certain it will go far towards forcing manufacturers to build cars giving much higher thermal and mechanical efficiency than they do to-day, and further, will perforce lead them to go more into the scientific branch of their business and make them endeavour to find means of getting better results from a gallon of petrol than their neighbour."

### Hill Climbing.

In connection with hill climbing it may be well to remember that a great many short hills having good surfaces may be "rushed" on the top speed if the throttle is opened widely some distance before the hill is reached and the ignition somewhat advanced, so as to give the car the advantage of high momentum. As the car proceeds up the slope the engine will slow down, and while the throttle should be kept wide open the slower speed of the engine may require the ignition to be some-

[A. H. Fry, Brighton.

Photo by]

can be put in gear by some official on the start of the competition, and put out of gear at the finish. The number of revolutions run by the engine having thus been ascertained, and the bore and stroke being known, the power could be calculated. The only fault with this system is the fact that one cannot know the mean pressure in the cylinders, which of course varies with every make of engine, and therefore an assumed mean pressure would have to be taken, so that the horse-power obtained would be more or less fictitious."

### Fuel Consumption as the Guide.

"The better method—and one which I have often wondered has not been adopted before—is," continues Mr. Napier, "that which was, roughly, put in force in last year's Tourist Trophy Race, i.e., that the fuel consumption be measured. A definite amount of power should be got from a certain quantity of fuel, and if that power is not obtained the engine or gearing is not as efficient as it ought to be. With the fuel consumption measured during a trial and the weight of a car known an absolutely

what retarded. If this is the case one will generally become aware of it by the knocking sound emitted by the motor. By the expert use of the throttle and ignition a very steep hill may be frequently ascended without recourse to a lower gear, but it is not advisable to wait until the motor is severely overloaded and almost brought to a stop before changing to a lower speed.

Mr. W. H. MASON, of Kingsland Bridge, London, is known to motor-car manufacturers as a maker of well-designed motor bodies, to which department he has given special attention of late years. From the designs submitted in his new catalogue the various types of carriages seem well designed and of good construction.

Mr. A. H. HUNT, 115-117, Cannon Street, E.C., has issued a catalogue dealing with Hellenes's dry cell ignition batteries. Advice and instruction as to the selection and use of dry batteries for motor-cars, cycles, &c., are given, as well as hints with regard to connections, &c., and useful testing instruments.

[Letters to the Editor should be addressed to the offices,  
87-83, Charing Cross Road, W.C.]

### A REGRETTABLE INCIDENT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As a subscriber to your paper for some time, I hope that you will find space for the following, which shows why some of the general public hate us motorists, and class us all as "road-hogs," owing to the misdeeds of a small minority. Perhaps also the publicity might be the means of my being able to identify the car in question. On Friday last, the 20th, I was out with two of my children, both of whom were riding donkeys, and accompanied by two dogs. I had just met a friend of mine who was riding a bicycle, and who had got off to talk to me. We were then engaged in talking to three of my men who were trimming the hedges by the side of the road, consequently there were a good number of us altogether, and as the road is a comparatively narrow one, it would not be asking too much to expect anyone to drive a car carefully past us. This was on the road between Lewes and Ditchling, about 200 yards beyond where the road makes a sharp turn from the main road leading to East Grinstead, at which turn there are no less than three red triangles, one for each direction. At just about a quarter to four a large covered car, I believe with brougham top, and painted dark blue, came round the corner from the direction of Lewes, and before I had time to get one of my dogs to my side of the road, hampered as I was with the children on their donkeys, was close on us. The driver blew his horn three or four times at the dog, but never slackened speed in the least, and drove

A Daimler Car in Spain.

The vehicle seen in the illustration was close to the scene of the explosion of the bomb thrown on the occasion of the wedding of King Alfonso.

right over him, two wheels passing over him, killing him on the spot. Thinking that no doubt the car would stop, none of us thought of taking the number till too late, and all we could make out was L.C. followed by a number of three or four figures ending in what looked like 89. One of us distinctly saw a man's head out of the side window, looking back, and I saw a face looking through the glass window behind. We waved to them to stop, but they took no notice whatever. I immediately went home, got out my own car, and went to Ditchling to inform the police, and to see if anyone could tell me anything about the car, but hitherto to no purpose. I then drove back to Lewes, and informed the police there, as the car probably came through there. This is the second time I have had a dog killed on the road, on both of which occasions the driver has gone on, though presumably aware of what he had done. The first occasion was before the days of identification plates. If any of your numerous readers can help me to discover the car, I should be most grateful, as such conduct is too disgraceful. It is to the interest of us all to stop this sort of behaviour.—Yours truly,

JOHN SHIFFNER, A.P. 8 AND 847.

### REFLECTIONS FROM GLASS SCREENS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As you wish for the experience of users of glass screens, and as I have used screens for years, and of a variety of patterns, I will

give my opinion, which is that the best screen is one not higher than the driver's eye—rather lower is better. I do not like any bar across the top of the glass. After using these low screens, both upright and sloping, I much prefer the sloping form. I am not at all troubled with reflections, and in case of rain, snow, or fog making the view indistinct, it is easy to look over the top. I would much rather drive in bad weather, either night or day, behind such a screen than with no screen and goggles. I consider it much safer. I have had no experience as yet in going through it, but, in my opinion, as soon as the heavy plate glass is broken, its own momentum and the push it would get from the bodies of the occupants of the front seat would send the lot well away, and their faces would be well above it. I think it is much more important to have the screen wide than high. The wide dashboards of the Daimler and Brooke cars lend themselves to this sort of screen, and the slope not only does away with dangerous reflections but is a great protection from rain. It is easy to fix a second screen above the one I have explained, with a greater slope still, but this I prefer of celluloid. The main point with this second screen is to fix it 2 in. above the glass. This gives a clear view with no draught on the face.

—Yours truly,

ERNEST ESTCOURT.

### DRIVERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Might I be permitted to say a few words re Mr. Percy Richardson's letter, from the point of view of a disappointed would-be driver? He seems to have gone thoroughly into the matter, for he has stated our case exactly.

If there was a club or garage that would give a good finish off, "I should think a few runs with about an hour at the wheel," I feel confident that there are scores who would be glad to pay a moderate fee. Of course, there would be a certificate required, "and one that would be recognised," to all who proved desirable and capable drivers. Personally I have taken a great interest in motor-cars, motor-cycles, &c., for years, and owned several motor-bicycles, so that I had a good idea of the petrol engine before I paid my premium for four months at a garage, and on more than one occasion have helped old drivers on the road out of trouble, but am still unable to find a way out of my own.—Yours truly,

A. WOULD-BE DRIVER.

### HILL CLIMBING CONTESTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I regret to see in your last issue that the North Eastern Automobile Association have been rash enough to admit steam cars to their hill climbing contest, thereby exposing most of their members owning some of our finest petrol cars to unfair and rather ignominious comparison. Moreover I learn that, instead of being grateful thereat, the steam car competitors actually had the ill grace to feel aggrieved at being excluded from the handicap. The promoters paid them the compliment of classifying them as equivalent to an eight-cylinder petrol engine of the same bore and stroke. What more can they want? Surely this should satisfy their self-esteem.

With regard to the handicap, it is a well-known fact that no formula has yet been applied that will work out the results of handicaps where steam cars are included without bringing out the steam cars on top, which is, of course, not at all a proper state of affairs. I would like to suggest, therefore, that the A.C.G.B.I. should offer some inducement—say a certificate of proficiency, at a merely nominal fee to cover expenses—to any person, provided he is a member of the A.C.G.B.I. or affiliated thereto, who shall invent and prove the efficiency of a formula which will work out these hill climbing handicaps in such a way as will permit petrol cars to clearly prove their superiority over steam, without actually excluding the latter.—Yours truly,

W. E. FURNEAUX.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to Mr. T. H. Woollen's letter in the last issue of the *M.C.J.*, I would assure him that the remarks contained in my previous letter were made after attending a number of the hill climbs held this year, and examining the cars taking part. It would obviously be incorrect if I were to assert that every member of the trade taking part in these competitions entered special cars, but what I do say is that the manufacturers and agents entering ordinary standard cars are placed at a serious disadvantage. The whole trouble is that the rules are not strict enough, and the rules that do exist are not sufficiently strictly enforced. It is, obviously, impossible for me to mention names, even did I wish to do so.

I cannot help thinking that Mr. Woollen has not been sufficiently critical in examining the various cars which have taken part in these hill climbs. I am not blaming the manufacturers, as, obviously, if the rules allow them to run such cars, it would be foolish of them not to take advantage of this, as the success of a car in a competition has a certain commercial value. It is a matter of business, as these events are now conducted. A proper formula—fair to everybody—and proper rules, is the sole solution of the whole trouble, and until we get these there is

bound to be a great deal of dissatisfaction, and very rightly so. While competitions are run under the present rules, I think it would be far better for trade entries to be barred. If Mr. Woollen has been successful in winning one of these competitions on one of his ordinary standard cars, I have to congratulate him, and his case is but the exception which goes to prove the rule.—Yours truly,

CHAS. JARROTT.

### THE CIRCUIT EUROPEEN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As one who had made every arrangement to go through the Circuit European competition, and which has since been abandoned on what I consider to be unsatisfactory grounds, I have endeavoured to ascertain from various representative British firms what amount of loss in materials and otherwise they have been at in the matter. I find that the manufacturers in the Midlands—the Daimler, Wolseley and Humber firms—have been the most direct sufferers. The Daimler Company built three special engines that they might be of the maximum size allowed for their class, and three bodies—in fact, three cars so constructed as to completely comply with the regulations for the event. They have them now on their hands. The first intimation received concerning the decision to postpone the trial was a report of Baron De Zuylen's speech in the French technical papers, on chancing to read which Mr. E. M. C. Instone wrote to the A.C.G.B.I. that strong repre-

### THE HELE-SHAW CLUTCH.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In answer to Mr. Herbert Smith's enquiry in the last issue of the *M.C.J.*, re the Hele-Shaw clutch I may say that the one on my 30 h.p. Argyll has given every satisfaction. I have had no trouble with it and have used it for over 4,000 miles. The Argyll people, I believe, fit them on all their cars now. You simply see whether they require any lubricant every 500 miles. A special oil is being supplied. I consider it is one of the finest inventions for cars.—Yours truly,

J. O. HUNT, JUN.

### ACCUMULATOR CHARGING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be much obliged if some readers of the *M.C.J.* would state their experiences of the Boron cells for charging accumulators. I understand that a novel type of cell is now to be obtained, that may be used for both lighting and charging; such a combination would certainly prove most convenient in a motor house for inspection purposes, where petrol or other volatile liquid may be stored.—Yours truly,

C. COLLIN.

### STEAM CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to "Engineer's" letter in the *M.C.J.* of July 7th, re the climbing powers of steam cars, I must first correct an error I made

The Motor Car Meet at Longleat House, the Seat of the Marquis of Bath. (See page 465).

sentation should be made to the Automobile Club of France as to the damage, both financially and otherwise, which would be suffered by entrants in the event of the test being abandoned; and it is understood that the British Club took the matter up, without, however, any satisfactory results. The Humber Company entered two cars for the event, and the special bodywork, which had been practically completed, had to be scrapped. The Wolseley Company had particularly reserved itself for the trial. Indeed, they had not entered any large cars in any other test this season. They had specially finished two engines to meet the regulations, the maximum bore allowable being 130 mm., whereas their standard 32-h.p. engine has a bore of 133 mm. In addition the firm built two bodies to exactly the dimensions set out by the French Club.

The chief reason given out officially for the abandonment this year of the Circuit European is "with the view of giving more time." This might be argued to mean to afford the organising body more time: more actually it is that the French firms were not ready with their cars for this important event—mostly because they did not intend to be ready. I have a very shrewd suspicion that the real situation is summed in a phrase contained in a letter to me on the subject from the managing director of the Humber Company. "So far as we can learn, the preponderance of English cars entered alarmed the French makers, who feared the success of the English cars, and that is the real reason of the postponement." In any case, I think the time is ripe, now that we are in the midst of a comparatively dull season as regards motoring events—dull because it had been more or less set aside for the Circuit European—that what appears an eminently unsatisfactory business should be thoroughly investigated.—Yours truly,

H. MASSAC BUIST.

in my quotation from Mr. Smith's letter, and that is in the last sentence, "I have from a standing start driven a 9-h.p. new type Serpollet up a short incline of 1 in 3½," which should read 1 in 3. I happen to know that this was an actual test in the workshop, and I feel sure Mr. Smith would again carry out this test in presence of witnesses if required, to demonstrate the truth of this, as I know it is pretty hard to swallow.

Unfortunately, Mr. Smith has not given the name of the hill near Dorking with the grade of 1 in 3½ in parts, up which the Serpollet was driven. I think, however, that it must be Leith Hill, and when I cycled (but not motored) down this hill I formed a notion that it might be 1 in 4 if not steeper in parts. I have not got my map with me, otherwise I would give "Engineer" the bearings of the hill from Dorking, but I should think it would be about two miles S.S.W. of that place.

Re Clarkson's 'buses on 1 in 4.7, I can quite believe that they can go through the performance of stopping and starting on that grade, as I have seen them running in that town of hills, Torquay. I will, however, pin my faith to the Serpollet system, and think that the new Darracq-Serpollet 'buses will please the general public far better than any of the petrol systems. As the above 'buses will burn crude petroleum fuel at about 2d. per gallon, and as the engines of the Gardner-Serpollet system cost but little for upkeep, I think the Darracq-Serpollet should be a good success.

If the editor of the *M.C.J.* can see his way to reproducing a short article from the E.M. of July 6th re the purchasing of reliable second-hand small cars, I am sure he will be doing a great service to that great and ever increasing body of people with small means who wish to

go in for motoring, but who fear the first great expense. They think that they must pay a high price for even a second-hand car, and that if it is cheap it must be unreliable. The article shows that there are some reliable kinds which may be bought for the modest sum of £20. The cheapest way to buy a car is first to belong to the Motor Union, then get the Union to send one of their men to report on intended purchase.—Yours truly,

J. H. BROOKES-SMITH.

### THE RENAULT RACING CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having noticed in a recent issue of the *M.C.J.* that the Renault car in the Grand Prix had no differential gear, I should be obliged if you could tell me whether both back wheels are keyed rigidly on to the axle, or whether there is some ratchet device, as in some small cars I have seen.—Yours truly,

"MOTOR MAD."

[The rear road wheels were, we understand, rigidly keyed on to the axle. The wheel track of the car was reduced as much as possible in order to make up for the absence of a differential.]

### THE HORSE POWER OF MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—For several years I have suggested that the various powers denominated in makers' catalogues were misleading, and I have suggested that for the purposes of comparison cubical inch contents of cylinders was the only proper comparison. Whereas I took ten cubic inch contents to represent 1-h.p., Mr. Edge wants it to be represented by

The Special Car built for Sir Charles Hardinge by the Wolseley Company. The Chassis is of the 16-h.p. type, but is fitted with an 18-h.p. Siddeley Engine and a double Landaulst Body by Hamshaw, of Leicester.

seven cubic inches only. It makes no difference what the unit is. By all means let it be seven. There is, however, one point Mr. Edge leaves out in his formula, that is price, without which it is impossible to obtain a comparison of efficiency. I have, therefore, addressed the following letter to the Secretary of the A.C.G.B.I.—Yours truly,

D. M. WEIGEL.

Copy of letter from Mr. D. M. Weigel to the secretary of the Automobile Club of Great Britain and Ireland:—

July 17th, 1906.

With reference to the letter dated July 4th addressed to you by Mr. S. F. Edge and published in the automobile Press, would you permit me to point out that in suggesting a formula upon which to base a comparison between the relative performances of various makes of cars in hill climbing competitions Mr. Edge leaves out all question of price of the vehicles. Inasmuch as "efficiency" is merely another term for economy, I would point out that without the price being taken into consideration true efficiency cannot be calculated at all. The purchasing public are not only desirous of knowing which car is the speediest or best hill climber, but they are equally desirous of knowing what extra speed and power costs them. The car showing the best result in proportion to price is (there is no question of that) the most efficient. Therefore, in his desire to form a fair formula, Mr. Edge must include price, as his suggestion to obtain a true result of efficiency becomes an absurdity otherwise.

I agree with Mr. Edge that catalogue denominations of power should be ignored, and that the power of an engine should be denoted by its size, viz., cubical inch contents. The unit he suggests of 7 cubic in. per h.p. is in my opinion an impossible one to attain, but if all are treated the same it does not matter. I fail to see that weight has any-

thing to do with the question. Under Mr. Edge's formula the heavier car would have the best chance. If weight were limited to various classes thus:—Class A, under 18 cwt. all on, and class B, under 25 cwt. all on, the manufacturer would strive to make his car as light as possible, which is the aim of all makers. But under Mr. Edge's formula the manufacturer would have everything to gain, certainly nothing to lose, by manufacturing his car as heavy as possible. Surely that is a step in the wrong direction. The formula I would suggest is:—

Price  
h.p.  $\times$  time.

Taking as an example three cars' out of Mr. Edge's list, and suggesting that all cars did exactly the same time, say 60 sec. up an imaginary hill, and base the h.p. on the suggestion that 7 cubic in. equal 1-h.p., we have the following result:—

30-h.p. Daimler	...	690	$\times$ 60	=	657½	points, winner.
		63				
24-h.p. Fiat	...	720	$\times$ 60	=	685½	" 2
		63				
40-h.p. Napier	...	1250	$\times$ 60	=	1744½	" 3
		43				

It will be readily seen that the Daimler is slightly, in fact a mere fraction, more efficient than the Fiat, but that both of them are practically three times more efficient than the Napier. Can it be that because, based upon a proper formula, the Napier car being about the heaviest and dearest car upon the market, it would be practically last every time, that Mr. Edge has proposed his curious formula? In framing a rule for efficiency, might I repeat that efficiency being merely a coined word for economy, that co-efficiency or comparative economy cannot be judged without the cost of the articles in competition being taken into account. Mr. Edge's letter suggesting an attempt to judge co-efficiency without price is absurd, and I trust, Sir, that your committee will view the matter from the same point of view that all engineers view it from, and that is—efficiency means cost.—Yours truly,

D. M. WEIGEL.

### BRAKES FOR MOTOR-BUSES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Whatever the expert decision as to the cause of this—the Handcross—accident may be, the question of brakes must undoubtedly be seriously considered, admitting that the present system of braking is sufficiently good to brake the cars for quick stoppages on level surfaces. In making long descents the brake strain is much increased, and these being sensitive to allow for foot actuation, the writer considers them inadequate. If the London bus companies would requisition the experience of a good carriage builder to fit a brake of the wheel type as fitted to heavy horse-drawn vehicles, the results would be satisfactory. I suggest this to be an additional emergency brake, which would give the riding public the satisfaction of knowing that their safety was being considered.—Yours truly,

J. HOLDING.

### THE DANGER OF PETROL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was much interested in the letters on this subject from Mr. C. S. Drewry and Mr. W. Jamieson in the last issue of the *M.C.J.*, and in connection therewith it may be useful to mention that if the motor is run for a considerable length of time in a closed stable the exhaust gases pollute the atmosphere to such an extent as to render it unsafe to breathe. Respiration of such vitiated air for any considerable period is likely to produce a condition of intoxication, which is characterized by headache, nausea, and finally by unconsciousness. There should always be plenty of ventilation if a motor is to be run very much in a small stable.—Yours truly,

W. S. S.

### A FIERCE CLUTCH.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be glad if you would advise me re my leather-lined clutch, which is very fierce. When I let the pedal back ever so gently it does not bite at all until it grips with a bang. I have tried castor oil with only temporary effect, and have also loosened the spring; the clutch is nearly new.—Yours truly,

E. C. ELDRIDGE.

[The clutch might be thoroughly washed out with paraffin to remove all the grease. After the paraffin has been allowed to drain out the clutch will in all probability be found to slip. This can, however, be overcome by dusting a little fuller's earth powder on the leather, and occasionally dressing with castor oil and paraffin in equal quantities.]

NORFOLK HOTELS.—A correspondent about to take a holiday in Norfolk will be glad to have the names of any inns in the county that have satisfactory accommodation for motorists, not necessarily fashionable hotels, but comfortable hostleries for man and car.

HAVING seen Mr. Henry Moore's letter in the *M.C.J.*, Mr. A. Fincher would like to add his testimony as to the reliability of the Moseley Tyre Company's tyres. He has used their 34 by 5 tyres on his 18-h.p. car for the last six months, and, although he has ridden them over 2,000 miles, has never had a puncture.

## CLUBS AND ASSOCIATIONS.

### AUTOMOBILE ASSOCIATION.

WITH reference to the extension of their work between London and Scotland this season the Association selected a route likely to suit the requirements of most automobilists whose cars will start for the north in August. It is as follows:—London, Barnet, Hatfield, Stevenage, Baldock (or Hitchin) Biggleswade, Buckden, Stamford, Grantham, Newark, Retford, Doncaster, Ferrybridge, Tadcaster, Wetherby, Boroughbridge (via Leeming Lane) to Catcliffe, Scotch Corner, Darlington, Newcastle, Morpeth, Alnwick, Belford, Berwick, Dunbar, E. Linton, Haddington, Musselburgh, Edinburgh.

Over four hundred miles of road will be patrolled by the cyclists, whose services in respect of tyre troubles or temporary mechanical derangements will be an important factor in the progress of motorists to the moors.

### CRYSTAL PALACE.

A MEETING has been held with a view of forming an automobile club for the district. Twenty-one names were enrolled upon

1 min. 34 5-10 sec.; Messrs. F. C. Allworth, 1 min. 34 4-5 sec.; L. Beadle, 2 min. 36 4-5 sec.; H. A. Cunis, 2 min. 31 2-5 sec.; C. Gordon, 1 min. 28 1-5 sec.; A. Jackson, 2 min. 6 sec.; Mrs. Lucas, 2 min. 13 3-5 sec.; R. Lucas, 1 min. 57 2-5 sec. Hot water was provided for a picnic tea, members bringing their own tea baskets, and everyone present enjoyed themselves immensely, the weather and scenery leaving nothing to be desired, and the thanks of the club was heartily accorded to Lord Derby and the Hon. Arthur Stanley for their kindness and courtesy in the matter.

### MANCHESTER.

THE speed-judgment test competitions promoted by the Manchester Motor Club are always popular, and the fifth of the series, held on Saturday afternoon, proved no exception to the rule. Three prizes were offered, and of an entry of twenty-six, eighteen competed. There was a large gathering of motorists at the Kilton, Hoo Green, to witness the start. Mr. A. R. Albert started the men at Lower Peover at two-minute intervals, and each competitor was advised that the speed was to be at a rate of eighteen miles per hour. As to the distance timed over each competitor was entirely ignorant until he had finished. This proved to be four miles, so that the time standard of 13 minutes 20 seconds determined the prize-winners. The times accomplished were remarkably close, seconds only dividing the successful competitors from the correct time, thus showing pace judgment of no means order. The results were:—E. J. Dowe (tri-car), 1; J. T. Ward (motor-bicycle), 2; R. Stansfield (tri-car), 3.

Last week end the club had two important events. On the previous evening they had a race meeting on a small scale at Fallowfield track

The Scheveningen Automobile Meet. The Procession of Decorated Cars along the Promenade. [De Auto.

the membership list. It was decided that the title of the club should be "The Crystal Palace Automobile Club." Mr. Henry Hollands, of 16, Anerley Grove, Norwood, S.E., will act as hon. secretary, and members of the club will have the opportunity of joining the Crystal Palace Club. The subscription will be one guinea per annum, with no entrance fee for the first hundred members.

### EDINBURGH.

THE result of the Edinburgh Motor Club's recent competition on Soutra Hill has been officially declared as follows:—1, J. F. Duthie, 10-h.p. Whitlock-Aster; 2, R. Aitken, 16-h.p. Peugeot; 3, F. G. Simpson, 10-h.p. Humber; 4, R. Wilson, 10-h.p. Humber; 5, W. Inman, 15-h.p. Darracq; 6, Dr. Veitch, 20-h.p. Argyll; 7, L. Knoblauch, 6-h.p. Siddeley; 8, R. Henderson, 20-h.p. Humber; 9, W. Adams, 24-h.p. De Dietrich; 10, Stirling Paterson, 15-h.p. Darracq; 11, W. L. Hugh, 28-h.p. Daimler; 12, A. Mackenzie, 16-h.p. Albion; 13, S. Morrison, 20-h.p. Darracq; 14, J. W. Patten, 8-h.p. Rover.

### BLACKHEATH.

THE speed-gauging competition of this club, which was held at Holwood Park, the seat of Earl Derby, proved a great success. Lord Derby and the Hon. Arthur Stanley met the members of the club on a car. A course of half a mile had been prepared, over which competitors had to drive at a speed of fifteen miles per hour, and consequently the one that ran the course nearest to two minutes' time was the winner, closest times being as follows:—Hon. Arthur Stanley, M.P.,

the event being a ten miles eliminating race on trial runs in four heats, to select a team to compete against the Liverpool Motor Club, who have challenged the Manchester Club to an inter-club race on New Brighton track on the 8th prox. The four heats were won respectively by H. Andrews, L. G. Barber, F. Dunderdale, and P. H. T. Butler, the runners up being J. Fraser, F. Westmoreland, W. T. Munroe and A. J. Moorhouse, and from these the team will be selected.

### CARDIFF.

THERE were sixteen entries for the speed judging competition of the Cardiff Motor Club mentioned in our issue of last week. The first prize was won by Mr. Harry Prickett, who reached the finishing post only five seconds over his time. Mr. J. W. Blackaller was second, and Mr. H. Haddon third.

### NORTHAMPTONSHIRE.

A MEETING of the committee of the Northamptonshire Automobile Club has been held at the George Hotel, Northampton. There were present:—Major Hibbert (chairman), Rev. S. Seggins Pratt, Dr. Henshaw, Mr. Humphrey Bennett, Mr. Charles W. Phipps, and the hon. secretary (Mr. Sidney F. Harris). The following gentlemen were elected to serve on the Legal Cases Committee:—The chairman, vice-chairman, Mr. F. Bostock, Mr. H. Bennett, and the hon. secretary. It was decided that a fee of 1s. be charged to all club chauffeurs who have their names entered on the register. It was proposed by the Chairman,

seconded by the Rev. W. S. Pratt, and carried, that a letter he sent to Colonel Stopford Sackville thanking him for his kindness in inviting the members to Drayton House on June 29th, and expressing their great appreciation of the way in which he entertained them.

### WEST SURREY.

THE invitation meets during July of the West Surrey Club were all marked by good attendances, this form of club activity being found, as a rule, to secure more support from members than any other except competitions.

On the 7th inst. members met at Grayswood Tower, Haslemere, by invitation of Mr. and Mrs. Barker. The meet on the 14th inst. was at Frolbury Manor, Dorking, by invitation of Mr. Warne, when more than fourteen cars attended. On Saturday last Dr. and Mrs. Rideal entertained the club at The Chalet, Elstead, among the members attending being Colonel Fairtlough, Mr. Alder, Colonel Swaine (Cadillac), Mrs. Sartorius (Cadillac), Mrs. Bullard, Messrs. Warne, Ingram (C.G.V.), Sparkes, Leon, Buttemer, Houghton (Renault), Dr. Bryden (Speedwell), Dr. Henderson and Mrs. Williams.

The annual gymkhana will take place to-day (Saturday), at Prior's Field, Compton.

### MOTOR CYCLE UNION OF IRELAND.

THE Dublin centre of the Motor Cycle Union of Ireland held a hill climb on Saturday last on a hill some miles from Dublin, in the Co. Wicklow. The contest, which was a handicap under the formula of Professor Callendar, was divided into two sections, pedalling and non-pedalling. The following are the times of the various competitors in both sections who succeeded in reaching the finish, where Mr. Colman O'Connell officiated, Mr. T. W. Murphy timing at the start:—

#### CLASS A. (PEDALLING).

Position.	Competitor.	Car.	Time. M. s.
1.	J. G. Drury ...	3-h.p. Triumph ...	3 58
2.	E. O. B. White ...	2½-h.p. Griffon ...	4 7 2-5
3.	C. B. Franklin ...	3-h.p. Triumph ...	4 8
4.	W. J. Gillespie ...	3-h.p. Morehampton ...	4 15 2-5
5.	W. Ladley ...	3½-h.p. Morehampton ...	4 28 4-5
6.	H. A. Evans ...	3-h.p. Singer ...	4 33 1-5
7.	B. Dumphy ...	2½-h.p. Minerva ...	4 47
8.	R. W. Howison ...	2½-h.p. F.N. ...	4 53
9.	J. Mooney ...	4-cylinder F.N. ...	5 3 2-5
10.	J. Hurst ...	2½-h.p. F.N. ...	5 14
—	W. H. Meredith...	2-h.p. Triumph, did not finish.	
—	E. Cannon...	2-h.p. Minerva, " "	
—	W. Jacques ...	3½-h.p. Aleyon, " "	

#### CLASS B. (non-pedalling.)

1.	C. B. Franklin ...	3-h.p. Triumph ...	3 38
2.	B. Dumphy ...	2½-h.p. Minerva ...	3 51 4-5
3.	J. G. Drury ...	3-h.p. Triumph ...	3 54 4-5
4.	W. Ladley ...	3½-h.p. Morehampton ...	4 6 1-5
5.	W. J. Gillespie ...	3-h.p. Morehampton ...	4 49 2-5
6.	W. James ...	2½-h.p. N.S.U. ...	4 57 1-5
7.	J. Kavanagh ...	2-h.p. Morehampton ...	5 34
—	H. A. Evans ...	3-h.p. Singer, retired.	
—	E. O. B. White ...	2½-h.p. Griffon, " "	

### AUTOCYCLE.

THE Autocycle Club's quarterly trial has been held over a 125 miles course from Uxbridge, via Beaconsfield, High Wycombe, and Dashwood Hill, to Banbury, returning to Uxbridge by way of Bicester, Aylesbury, Berkhamstead, and Chesham.

Out of an entry of twenty-three (fourteen bicycles and nine tricars), seventeen started, there being eleven bicycle-riders and six tricars. Non-stop runs were made by J. W. Chapman, 3½-h.p. Quadrant; G. Aldington, 2½-h.p. Kerry; W. Gunn, 10-h.p. Lagonda tri-car; Mrs. Hilda Hewett, 10-h.p. Lagonda tri-car; B. Holland, 9-h.p. Singer tri-car; C. K. Phillips, 9-h.p. Singer tri-car. The order of merit in the ascent of Dashwood Hill was:—Bicycles, L. W. Bellinger, 3½-h.p. Quadrant, 1; C. H. Gold, 3½-h.p. Rip, 2; H. C. Ebbutt, 6-h.p. Jap, 3. Tri-cars: B. Holland, 9-h.p. Singer, 1; Mrs. Hewett, 10-h.p. Lagonda, 2; W. Gunn, 10-h.p. Lagonda, 3.

### IRISH.

AN extraordinary general meeting of the club was held at the club premises, 34, Dawson Street, Dublin, when it was resolved that the amount of the entrance fee should be increased to three guineas. It had also been proposed that the annual subscription of members residing within twenty miles of Dublin should be increased to three guineas, but as this did not appear to meet with the approval of many members, this suggested alteration in the rules was withdrawn. The hon. secretary explained that all steps had now been taken for the registration of the club as a limited liability company, thus limiting the liability of members, and enabling debentures to be issued.

### MOTOR YACHT.

WITH pouring rain nearly all the previous day, it looked ill for the Club Handicap on Saturday, for which no less than twelve boats were entered, but in the morning the weather cleared up and it turned out a beautiful day. With a hot sun, a light N.W. wind and a smooth sea, Southampton Water was looking its best. Eight boats were started, and finished at the following times:—

		Start. H. m. s.	Finish. H. m. s.	Result.
Penguin ...	Mr. H. W. Hutchinson ...	2 40 48	5 0 40	3rd.
Tramp ...	Capt. E. T. Dixon ...	3 44 29	5 1 10	
Chrys ...	Mr. H. Brickwood ...	3 35 1	5 3 4	
Squirt ...	Mr. T. Winans ...	3 41 16	5 1 6	
Phoebe ...	Mr. W. Summers ...	3 27 33	4 54 50	2nd.
Commander ...	The Rear Commodore ...	3 41 18	4 54 23	1st.
Nan ...	Capt. E. T. Dixon ...	3 38 28	5 8 30	
Hebe ...	Capt. R. T. Dixon ...	4 0 0	5 1 20	

The course was, as usual, five times round the Greenlands Buoy, starting and finishing opposite the Enchantress.

THE Blackheath Automobile Club's gymkhana, which was to have been held to-day (Saturday), has been postponed.

### HILL CLIMB AT LONGLEAT.

BETWEEN the discussion and the dinner with which the Motor Meet began and ended at Bath on Saturday was a hill-climbing contest at Longleat, by permission of the Marquis of Bath. The following were the officials:—Clerks of the course, Sir Wroth Lethbridge, Bart., Col. H. C. L. Holden, R.A., F.R.S., and Mr. G. T. Langridge; stewards, members of the Somerset Automobile Club Committee; judge, Hon. A. Stanley, M.P.; starter, Mr. T. D. Dutton; clerks of the scales, Captain W. Vaughan-Jenkins and Mr. H. E. Hippisley; marshals, Mr. J. W. Orde, Mr. P. F. C. Elwes, and Mr. J. R. Benson; timekeepers, Mr. T. D. Dutton and Mr. C. Wheelwright; handicapper, Mr. W. Worby Beaumont; secretary of the meeting, Mr. A. Armitage, Haygrass, Taunton. The committee of the Somerset A.C. was composed as follows:—Mr. J. W. Aspinall (Weston-super-Mare), Mr. Stanley Austin (Glastonbury), Colonel Barrett (Moredon, Taunton), Mr. H. P. Batten (Yeovil), Dr. Benson (Bath), Mr. H. L. T. Blake (Fairfield, Bridgwater), Mr. C. H. Dawe (Weston-super-Mare), Mr. W. S. Donne (Castle Cary), Mr. P. F. C. Elwes (Somerton), Mr. R. B. Graves-Knyfton (Uphill), Mr. H. Hippisley (Ston Easton), Captain Vaughan-Jenkins (Monkton Combe), Mr. C. Chester Master (Bridgwater). The course was about a mile and the cars were timed from a standing start. The features of such events are practically the same wherever held, and a record of the results is the main point of interest. These were as follows:—

CLASS A.—For cars the list price of which is £150, and not more than £350; and in this class cars costing not more than £250 must carry two passengers, and cars costing over that and up to £350 must carry four passengers. The price of any chassis in this class must be less than £300; 10-h.p. Alldays, Mr. W. Allday, 1; 8-10-h.p. Coventry Humber, Mr. H. Wilcox, Warminster, 2; 10-h.p. Vulcan, Mr. E. H. Atchley, Gloucestershire, 3.

CLASS B.—For cars the chassis price of which is £300, and not more than £500, to carry four passengers. The chassis price includes the tyres; 20-32-h.p. Darracq, Mr. A. Rawlinson, 1; 22-h.p. Minerva, Mr. O. H. Bayldon, 2; 20-32-h.p. Darracq, Sir Thomas Sutherland, 3.

CLASS C.—For cars the chassis price of which is over £500, and not more than £850, to carry four passengers. The chassis price includes the tyres; 30-40-h.p. Daimler, Mrs. Herbert Lloyd, 1; 30-40-h.p. Daimler, Mr. P. Brodtmann, 2; 40-h.p. Berliet, Mr. J. E. Hutton, 3.

CLASS D.—For cars the chassis price of which is over £850, to carry four passengers. The chassis price includes the tyres; 35-h.p. Daimler, Mr. F. A. Bolton. This car did the fastest time of the day by 9 3-5 sec.

### THE NEWNHAM HILL CLIMB.

DAVENTRY had been alive with cars and cycles for the two or three days prior to the hill climb of the Coventry Motor Club on Saturday last, so that the inhabitants of the town and neighbouring villages were all aware of what was to happen, and consequently turned up in hundreds. By the kindness of Mr. Band, the local surveyor, and one of the clerks of the course, the loose stones were swept off the road and a decent surface was presented for the motor-bicyclists, who started first.

As the large number of eighty-three entries had been received, it was decided to run the first two classes with but short intervals between each start. The fun was then fast and furious. The speed with which the motor-cycles took the curves was a great attraction to the spectators and some excellent riding was witnessed. As the hill includes 106 yards of 1 in 6½, the few who did fail to climb the gradient should have every sympathy, and the successful ones congratulations.

The tri-car class produced, among other machines, a new pattern of Riley tri-car, of 5-h.p., which was successful in winning the cup for merit in its class. Miss Hind drove her 9-h.p. Singer well and came in third in merit in her class.

In Class 3 the speeds varied greatly amongst the third-six entries, and many of the drivers of the faster cars must have had great difficulty in cleaving their way through the spectators. Bad luck seems to have accompanied some of the entrants, especially in the cases of the 20-30-h.p. Maudslay and the 20-h.p. Marchand. Each had been doing excellent times in trials and should have made an exceptionally good showing. In the former case the car had been assisting the officials immediately prior to its turn by taking a message up the hill. Subsequently, just after starting, through a misunderstanding the driver stopped his car, and then, instead of returning, continued. His time was therefore about double what it should have been. The Marchand car suffered from too eager gear-changing by its driver and had to stop.

In the class for motor-bicycles Mr. J. Edge was first in order of speed on his 5-h.p. Vindec, Mr. F. Mustard (3-h.p. Triumph) being first in order of merit, Mr. R. M. Brice (3½-h.p. Brown) being second, and Mr. C. E. James (3½-h.p. Daintree) third.

The speediest machine in the tri-car class was Mr. H. J. Riley's 4-h.p. Riley. The order of merit was as follows:—1, A. V. Riley (5-h.p. Riley); 2, E. W. Harris (9-h.p. Singer); 3, Miss M. Hind (9-h.p. Singer).

In Class 3 the order of speed and of merit of the competing cars was as follows:—

Make and Advertised Horse Power.	Entrant.	Order of Speed.	Order of Merit.
24-h.p. Mass	Launcester Motor Garage	13	23
16-20-h.p. Rover	F. D. Gethin	11	21
20-h.p. Marchand	W. Pilkington	stopped on hill.	
22-h.p. Minerva	W. Byron	4	1
16-20-h.p. Rover	E. W. Lewis	10	22
10-12-h.p. Rover	E. W. Greaves	14	10
10-12-h.p. Humber	D. Gould	12	20
10-12-h.p. Humber	W. Tuck	15	18
10-h.p. Alldays	S. Downing	26	13
10-12-h.p. Humber	C. N. Patterson	23	27
20-30-h.p. Maudslay	C. Maudslay	29	30
10-h.p. Alldays	W. Allday	16	3
28-h.p. Isotta-Fraschini	H. O. Hall	3	26
16-h.p. Maxwell	F. W. Peckham	24	29
12-16-h.p. Talbot	G. R. Garrard	6	2
10-h.p. Alldays	W. Allday	22	19
20-24-h.p. Talbot	T. H. Woollen	stopped on hill.	
10-h.p. Alldays	W. H. Goodwin	18	7
20-h.p. Dennis	W. H. Lamotte	25	28
12-16-h.p. Talbot	R. T. Owen	19	15
12-14-h.p. West	E. J. West	20	17
16-20-h.p. Rover	P. Graham	stopped on hill.	
15-h.p. De Dion	W. Guilding	17	12
8-h.p. De Dion	E. G. Newey	28	9
30-40-h.p. Daimler	E. P. Prestwich	1	11
28-h.p. Armstrong-Whitworth	W. G. Wilson	8	24
8-h.p. De Dion	Miss D. Levitt	30	6
30-40-h.p. Daimler	O. Harmer	5	25
7-h.p. Clyde	G. H. Wait	21	4
16-20-h.p. Rover	J. K. Starley	7	13
16-20-h.p. Rover	F. Starley	9	16
6-h.p. Rover	B. F. Wright	27	5
30-40-h.p. Daimler	A. Farnell	2	8

### AMBASSADORIAL PRIVILEGES.

A CASE of some interest has been dealt with at Barnet. On the 7th inst. the American Ambassador was being driven by his chauffeur along the Great North Road, near Barnet. A policeman signalled to the chauffeur to stop the car, and on the car being brought to a standstill he was told he would be summoned for furious driving. When the case came on before the Barnet Magistrates evidence was given that the car was travelling at thirty miles an hour, ten more than the limit. Mr. Hodson, Chief Clerk at the Embassy, said that Ambassadors and their domestics were exempt from arrest or legal process, and produced an Act of Parliament, dated 1708, bearing on the subject. Viscount Enfield, from the Bench, asked if the American Ambassador wished the case not to proceed, and Mr. Hodson said that whether the Ambassador wished it to proceed or not it was quite beyond the power of the Bench to deal with it. The police inspector said that if the occupant of the car had declared his identity the Commissioner would have been supplied with the full particulars of the case. Mr. Hodson: Yes; and he would have quashed it in a moment. The summons was withdrawn.

### MOTOR-BOAT RELIABILITY TRIALS.

THE annual Reliability Trials of the Motor Yacht Club will take place in Southampton Water on the 1st and 2nd prox. In Class A, for boats not exceeding 75 M.M.A. rating, there are ten entrants, viz., the Maudslay Motor Company, Dean and Burden, J. Peroy Dean, P. Thellusson and Co., Mr. J. H. S. Phillips, J. I. Thornycroft and Co., De Dion Bouton, Ltd., Dickson and Halliday, Wolseley Motor Co.,

Parsons and Co. Messrs. Thellusson and Co.'s boat will be fitted with a Thornycroft motor, Messrs. Dickson and Halliday's with a White and Poppe engine, and that of Mr. Phillips with a Vosper motor.

Class B is for boats exceeding 75, but not exceeding 250 M.M.A. rating, and has brought the following entries:—Camper and Nicholson, J. I. Thornycroft and Co., Mr. G. J. F. Knowles, Legros and Knowles, Perman and Co., Capt. R. T. Dixon, R.E., Mr. A. G. Fentiman, Vosper and Co. The first entry will have a Fairbanks motor and Mr. Fentiman's boat a Blake engine. There are two entries for Class 2, the limit for which is 1,000 M.M.A. rating, viz., J. W. Brookes and Co. and J. I. Thornycroft and Co. In the cruiser class the competitors will be Dixon Bros. and Hutchinson, Teddington Motor Car and Launch Co., Mr. S. F. Edge, Woodnutt and Co., Mr. A. J. North, Perman and Co. The Teddington Company will have their boat fitted with a Wolseley motor and Messrs. Perman and Co.'s vessel will have a Goodhoop engine. The motors provided with all the other entries are sufficiently indicated in the names of the entrants.

Touring in France. The Archives Tower of the Castle of the Dukes of Savoy at Chambéry, France.

### ROAD REPORTS.

LEWES.—Lewes, with its steep hills and dangerous cross-roads, provides ample scope for improvement in connection with warning signals. The High Street, though of sufficient width for the greater part of its length, is dangerously narrow as it winds round the corner near St. Michael's Church. Approaching this spot from the centre of the town, and with the prospect of a hill-climb into St. Anne's, the driver of a motor-car is often tempted to accelerate his speed, and it would only need an unseen obstruction around the corner to provide every requisite for a serious accident. A road warning should certainly be set up in or near the town.

RYE.—A suggestion has been made that the surveyor to the Rye Rural District Council should make a tour of the locality with a view to reporting on dangerous corners where warning signals should be erected.

CRAWLEY.—The recent motor-bus disaster was referred to at the Crawley Parish Council, and attention was drawn to the dangerous condition of the main thoroughfare at Crawley. The Council decided to urge the Horsham Rural Council to repair the road at once.

WARMINSTER.—So great is the dust nuisance at Warminster that a number of residents in the main thoroughfare between Bath and Salisbury sent a cheque to the Warminster Urban Council to pay for the road being

tarred. The cheque was returned, but it has been decided to sprinkle the road with a dust preventive.

CHICHESTER residents are delighted with the effect of laying a coating of tar on top of the macadam roadway in East and West Streets. The other main streets of the town are to be similarly treated.

NORTHAMPTONSHIRE.—The county automobile club is communicating with the local authorities with regard to a dangerous bridge about a mile from Staverton on the road between Daventry and Southam.

WORTHING.—At Worthing the Borough Surveyor (Mr. Roberts) has lately been utilizing crushed clinker taken from the destructor works for road mending, and, mixed with other substances into a compound, it forms a very good material. The stretch at West Buildings has stood the test well, and Paragon Street is to be similarly treated. In Chapel Road natural rock asphalt has been laid with very satisfactory results so far as the dust question is concerned.

WANDSWORTH.—Notices warning motorists and others to proceed slowly at the junction of Portsmouth Road and the road leading across Putney Heath, and in the main road through Roehampton, are shortly to be set up by the local authorities.

### NEW COMPANIES REGISTERED.

HALLEY'S INDUSTRIAL MOTORS.—Capital, £75,000. To acquire the Glasgow Motor Lorry Company, Ltd. Registered office, 116, St. Vincent Street, Glasgow.

FRISWELL (1906).—Capital, £150,000. To adopt an agreement with Friswell, Ltd., and C. Friswell, and to carry on the business of motor, cycle, boat and vehicle builders and dealers, &c. Other particulars were given in last week's *M.C.J.*

GREEN'S MOTOR PATENTS SYNDICATE, LTD.—Registered with a capital of £10,000, to adopt an agreement with the parties carrying on business at Kimberley House, 14 to 17, Holborn Viaduct, E.C., as Green's Motor Patent Syndicate.

JOHN WOODHOUSE AND CO., LTD.—Registered with a capital of £2,000. To take over as a going concern the business of motor-car, house and horticultural builder carried on by Rosina Ault, at Coventry, as John Woodhouse and Co. Registered office, 158, Spion Street, Coventry.

INDUSTRIAL ENGINEERING AND MOTOR COMPANY.—Capital, £50,000.

### PUBLIC MOTOR SERVICES.

AMONG our small advertisements will be found several announcements of interest to all concerned in public motor services; the organisation of motor-bus concerns, &c. Drivers and others find our columns the best available means of reaching the organisers of such enterprises.

THE employees of the London Power Omnibus Company, Ltd., (Pioneer Line), held their first annual outing at Hastings. A party of fifty sat down to an excellent dinner at the Castle Hotel, presided over by Mr. W. E. Bracey Wright, the traffic superintendent, and Mr. A. Hills, his assistant.

A DRIVER in the employ of Patrick Hearn, of Gray's Inn Road, was summoned at Highgate Police Court for driving a motor-omnibus wantonly, or recklessly, at Ballard's Lane, Finchley. Inspector Sly stated that he was on his bicycle when he saw the defendant driving a motor-omnibus towards him. The road was partly "up," and a van was standing by the side of the road opening. The defendant was going at about eight miles an hour, and the driver of a restive pony held up his hand, but the defendant kept on. The pony became worse, swerved round, and backed the trap across the road. A lady in the trap stood up and signalled to defendant to stop, but he made no attempt to slacken his speed, and just managed to pass between the trap and the van, very narrowly missing the trap. The defendant:—I went through for safety, and that is where I made a little mistake. Mr. Barfield fined him 5s., and 12s. costs.

EVERY Monday Messrs. Joseph Tomlinson and Sons, Ltd., of Bedford Street, Sheffield, run a motor char-a-banc to Matlock; on Wednesdays it goes to Buxton.

A SPECIAL meeting of the Watch Committee of Manchester has considered applications for the licensing of motor-omnibuses received from the Manchester and District Motor-omnibus Company, Ltd. Licences for four motor-omnibuses, have been issued for three months from present date. The omnibuses will run between Stretford, Chorlton-cum-Hardy, Withington, and Burnage Lane to the Stockport Road tram route.

A SERVICE of motor-buses is to run between Portsmouth and Midhurst.

THOSE who took part in the Scottish Reliability Trial will remember the road from Tomintoul down to Grantown-on-Spey and rejoice to know that a different route has been chosen for the motor-car service to be started by Mr. Alex. M'Tavish, of the Richmond Hotel, Tomintoul, on Wednesday next. The chosen course for the new service will be via Glenlivet, Ballindalloch and the Haughs of Cromdale, along the military highway constructed by General Wade 150 years ago. A 16-h.p. Albion char-a-banc will be engaged in the work.

ON Saturday the London Motor Omnibus Company commenced a new service of motor-omnibuses between Gospel Oak and Lower Tooting.

Leaving Gospel Oak, the route taken is along Park Hill Road, across Haverstock Hill, and along England's Lane, Eton Avenue and Belaise Road, to Kilburn Station, thence along Harrow Road, through Westbourne Park and Grove to Notting Hill Gate and Shepherd's Bush. From Shepherd's Bush the omnibuses go by Netherwood Road, along Hammersmith Broadway, to Fulham Palace Road, Putney Bridge, and Upper Richmond Road to Wandsworth, and then by Garrett Lane to Earlsfield and Lower Tooting. The fare for the whole distance is 8d.

THE Vanguard omnibuses have been taken off the service from Hammersmith to Hampstead Road, and it is stated that the London General Omnibus Company, following their example, will take off their motor-omnibuses, though the service of horsed omnibuses will be retained.

THE magistrate at Bow Street Police Court has promised Lord Kilmorey a summons if the motor-buses taking up passengers in King William Street, W.C., can be shown to be a nuisance, so far as the Charing Cross Hospital is concerned.

A SERVICE of motor-omnibuses between Stretford and Didsbury was inaugurated on Saturday by the new local company, of which Councillor Boyle is managing director. Levenshulme will have a service in the next few weeks. The garage of the company is at Trafford Park, and can accommodate fifty vehicles.

MR. W. J. ELLIS is applying for a licence to run three motor-buses from London Road, Southchurch Road, Southend-on-Sea, on to Shoeburyness.

THE motor-buses for the Great Eastern Railway Company, recently referred to in our columns, are fitted with Royal Sirdar Buffer tyres, as are also forty of those belonging to the Great Western Railway, and all those of the Great North of Scotland Railway, the Star Omnibus Company, and the Sussex Motor Road Car Company, to mention but a few of the public motor services which have adopted these tyres.

ON Tuesday, Alfred Sharp appeared before Mr. Marsham at the Bow Street Police Court to a summons charging him with driving a motor-bus in a manner dangerous to the public. The defendant said the road was greasy, and he got on the wrong side of the refuge entirely owing to his bus having skidded. If he had put on the brake when the skidding occurred the bus would have turned completely round. The best thing to do in these circumstances was to steer in the direction of the skid. If he had not gone on the wrong side of the refuge he would have gone into the refuge itself. William Cull, who was called as an expert, said he quite agreed with the defendant as to the danger of attempting to stop a heavy motor-bus when it commenced to skid. He once attempted it, and the bus turned completely round. Mr. Marsham said it was a complicated case. It was difficult to see why the defendant should have gone on the wrong side of the road unless the bus skidded, and if it did skid—and he believed it did—he was not to blame. The summons would therefore be dismissed.

### A CHAUFFEUR'S CONTRACT.

IN the Westminster County Court, before Judge Woodfall, the case of Wastnidge v. Hotel Cecil (Ltd.) has been heard. The plaintiff, it was explained, was a garage proprietor, and had had in his employ a skilled workman who was under a contract to remain with him for one year, which period expired on the 24th inst. These contracts were obtained from all the plaintiff's chauffeurs, because it was so difficult—in fact, almost impossible—to get one sufficiently trustworthy in the stress of the season.

The man in question, however, left the plaintiff, in spite of his agreement, and entered the employ of the Hotel Cecil (Ltd.). The defendants were informed of the facts, and sent a copy of his contract, but they still kept him in their service, and hence the plaintiff now sought to recover damages from them on the grounds that they had induced the man to break his service with the plaintiff, and had harboured him, in spite of the existence of his contract.

The defendants contended that the man came to them in the ordinary way and asked for employment and it was given to him.

James Valentine, the chauffeur in question, also stated that last July, when he signed the contract, he was given to understand that it was only an agreement that he should not take any of the customers' cars away. Nothing else was said, and, if there had been, he would not have signed it. Under cross-examination, however, he admitted that he understood he had a year's certain employment with the plaintiff, but he thought he could leave when he liked.

The judge gave judgment for the plaintiff for the amount claimed—£50, with costs.

### THE BRIGHTON MOTOR ROAD.

BEFORE the Master of the Rolls and Lord Justice Moulton the case of "Rex v. Brighton Corporation (ex-parte Shoemith)" was mentioned in the Court of Appeal on Monday. The Divisional Court a short time ago made absolute a rule nisi for a certiorari to bring up to be quashed certain orders and resolutions made by the corporation of the borough of Brighton in July and August, 1905, whereby it was ordered that the treasurer of the borough should pay to the Public Works Committee two sums of £2,500 and £550, which had been agreed to be paid to the contractor who had undertaken at their instance to tarmac a portion of the Madeira Road in order to

make it suitable for the Automobile Club races. When the rule was applied for it was said that the road was in a perfectly sound condition and that the alteration was not required on the ground of necessary repair or reconstruction, and was therefore a waste and illegal expenditure of the rates. The Divisional Court accepted this view and made the rule absolute. The result of that decision, so long as it stood, was to render some individual or individuals personally liable to pay for the work, and an appeal having been entered by the Corporation, the applicant for the rule applied that the appeal should be expedited on the ground that unless the appeal was speedily heard and determined the personnel of the borough council would probably be changed, and the difficulty of fixing the liability on who was to pay greatly increased, in the event of the appeal being dismissed.

Their lordships dismissed the application, the Master of the Rolls saying no sufficient ground had been made out why other litigants should stand aside for this appeal to be brought on and disposed of out of its turn.

### CASES AGAINST MOTORISTS.

SERGEANT WAGHORN'S timing operations in the Hailsham Division resulted in a batch of motor cases at the Petty Sessions on the 18th inst. Seven out of eight defendants were fined various amounts, totalling about £42. The case against Mr. A. D. Grigg, of London, was adjourned for a fresh summons to be issued. It was stated that he went abroad immediately after the police had stopped him, and sent a cheque for £20 to the Secretary of the Automobile Club with instructions to pay the fine and return the change, "if any." He had asked that the summons should be left at the Automobile Club.

LIEUT. the HON. H. MEADE, R.N., was fined £2 and costs at Kingston for driving a motor-car along Portsmouth Road at a speed equal to 33 miles an hour. Defendant wrote admitting the offence, and saying he had orders to proceed to his ship with all dispatch. Eight motorists were convicted at the same court of exceeding the speed limit in Richmond Park. The fines ranged from £1 to £2.

THE Westminster magistrate has directed a further remand in the case against Malcolm Henry Stern, chauffeur, who is charged with the manslaughter of William Alves, and causing injury to other persons through recklessly driving, while drunk, a motor-brougham in High Road, Knightsbridge.

SYDNEY ENGLAND, of Manchester, has been fined £10 and costs at the Bradford West Riding Court for furiously driving a motor-cycle on the Leeds and Bradford road. A mechanic who had timed the defendant said the speed for 500 yards worked out at 70 miles an hour.

A FRENCH motorist named Arthur Adlard, who was fined £5 and costs at Kirkham for furiously driving a motor-car, pleaded that he was unacquainted with English methods, and his "cut off" refused to act coming down a steep hill. The Bench pointed out that he did not sound his horn or give any warning that his car was running away.

THE Motor Union has decided to support and assist one of its Manchester members in an appeal against a conviction at Northwich for having caused smoke to be emitted from his motor-car. It was contended for the defence that the owner of the car could not be summoned, as the prosecution were unable to prove that he was driving the car at the time, and that the section of the Act under which the summons was taken out had been repealed. He also submitted that as the car was under three tons and was constructed to consume its own smoke except from some temporary cause, that the summons fell to the ground. The magistrates, however, imposed a fine of 5s. and costs. An appeal will be made against this decision.

RUPERT WILLIAMS was summoned at Kingston for driving a motor-car at a greater speed than twenty miles an hour, at Cobham. The chairman (Mr. W. Y. Cockburn) said as the defendant had already been summoned for driving to the danger of the public, at the same time and place, the Bench were of opinion that the summons should be withdrawn. Mr. Staplee Firth defended. His client had already been tried and acquitted, and it was a monstrous thing to summon him there again for practically the same offence. He had brought a surveyor to prove that Superintendent Marks could not possibly see the car from where he was standing, as well as a gentleman from Anglesey and the defendant, who had to leave his regiment to attend, and he hoped the Bench would mark their disapprobation of this improper prosecution by awarding the defendant substantial costs. The chairman said they would not grant costs, but they expressed the opinion that it was not fair to a man to bring him there twice for the same offence. The summons was then withdrawn.

AT Hampstead a motor-omnibus driver has been fined 10s. and costs for driving his omnibus at the rate of over fifteen miles an hour over a measured distance in Finchley Road. Two of the five magistrates dissented from this conviction, as defendant was only timed for half a minute, and when going down hill.

SOLOMON GOLDBERG, of 25, Hackney Road, Shoreditch, has been summoned at Stratford for driving a motor-car without having been registered, and also with not having a licence. On June 17th the defendant met with an accident in Lea Bridge Road, Walthamstow, and a policeman, who was called, asked him for his licence. The defendant, who said his car had skidded and had knocked down a boy, produced merely an Inland Revenue licence. The subsequent inquiries showed

that he had not registered his car. He purchased the car, which was registered by its former owner, some three years ago, but the authorities had not been notified of the transfer. The Bench dismissed that summons, but for the second offence they imposed a fine of 20s. and costs.

A LONDON motorist has been summoned at Folkestone for not having a light at the back of his motor-car to illuminate the identification plate. P.C. Prebble said he was on duty in Dover Road when he saw defendant driving a motor-car down Dover Road into Dover Street. He noticed there was no light at the back of the car. Witness asked him if he was aware he had no light at the back of his car. He said "No." Defendant handed witness his licence, from which he took his name and address. The Chairman said, if there was an offence, it was only a technical one, therefore the summons would be dismissed.

MR. MARSHALL HALL'S chauffeur was recently fined 12 and 17s. costs for motoring at twenty-five miles an hour at High Wycombe.

AT the Maidstone Police Court the Chief Constable said he would respectfully ask their worship to inflict a more substantial penalty on motorists than had hitherto been the case. The two succeeding motorists before the Bench were fined £5 and £8 respectively.

DURING the hearing of a case of a man charged at the Navan Petty Sessions with being drunk while in charge of a motor-car, Sir John Dillon said he was the only motoring magistrate on the Bench, and he objected to the motor-car being introduced into the matter at all. The case was one of an ordinary character—in no way reflecting upon the motor-car movement.

BERNARD EBELL, of Burgh Heath, Epsom, was summoned by Inspector Johns, of Woodford, for riding a motor-car at more than twenty miles an hour, at Epping New Road, Woodford, May 25th.

One of two 12-15-h.p. Arrol-Johnston Light Delivery Vans built for the Bon Marche, Liverpool. The vehicle is constructed to carry loads up to 15 cwt., and is capable of attaining a speed of twenty miles per hour.

Constable Hill, 439 J, gave evidence that he, with a sergeant, timed defendant over a measured distance, which he covered at the rate of thirty miles an hour. He had been previously fined, and a penalty of £5 and costs was now imposed.

AT the Warwickshire Assizes, on Saturday, Herbert Collins, a chauffeur, was sentenced to nine months' imprisonment on a charge of the manslaughter of Herbert Price at Olton, on June 9th, by recklessly driving a motor-car.

AT the Haywards Heath Police Court on Saturday, William Gadsdon, cycle and motor engineer, Crawley, was charged with being drunk while in charge of a motor-car on the highway at Haywards Heath on July 20th. After hearing evidence he was fined 40s. and costs.

AT Dunblane Sheriff Court, Fredk. Nicholls has been fined £5 for having driven a motor-car on the Trossachs road, which is closed for motor traffic.

A BATCH of seven summonses against drivers of motor-cars for exceeding the speed limit was dealt with at the Uckfield Petty Sessions on Thursday of last week. The fines imposed and the costs amounted in the aggregate to £34 11s. 1d. Among the cases was that of Mr. H. G. Abrahams, 5, Tokenhouse Yard, London. Inspector Jennings, of Guildford, deposed that he was fined £7 for a similar offence at the Guildford Sessions in March last. Sergeant Waghorn proved a conviction at the Haywards Heath Police Court on May 2nd, when he was fined £3 and costs. Mr. Lawson Lewis also stated that on the day he was stopped at Maresfield he committed an offence, for which he was summoned and fined at Oxted. The Bench imposed a fine of £10 and 17s. 4d. costs.

WILLIAM ASHFULL, of 20, Wellington Street, London, W.C., was summoned at Bath on Saturday for driving a motor-car in High Street.

and failing to produce his licence when demanded so to do by P.C. Russell, on July 13th. He was also summoned for (he having been convicted on April 21st of an offence under the Motor Car Act, 1903) failing to produce his licence within a reasonable time for the purpose of endorsement. P.C. Russell gave evidence in the first case, which the magistrates dismissed. Chief Inspector Bence proved the conviction in the second case, defendant being fined 20s. or seven days for driving a motor-car without having a rear light. The money was not paid and the licence was not produced for endorsement. Defendant was written to and the money was subsequently paid. So far as he knew, the licence had not been produced for endorsement. Defendant was fined 40s. and costs.

At the Oxted Police Court on Monday several hours were occupied in hearing eight cases in which motorists were alleged to have exceeded the speed limit. In the case of Mr. Herbert Austin, it was alleged by P.S. Bailey that the defendant travelled over the measured distance at Godstone at a rate of twenty-seven miles an hour. It was admitted that one of two danger signals was placed on the wrong side of the road, this being very deceiving to motorists. Defendant said when he saw the danger-signal he slackened speed, and when in the danger zone, which was a part of the measured distance, he was not travelling at a greater speed than twelve miles an hour. A fine of £4 and costs was imposed. The Bench agreed to state a case, and notice of appeal was given.

THERE were three motor cases at the Shoreham Petty Sessions on Monday. Lord de Clifford, London, pleaded guilty to exceeding the speed limit at Southwick, and also to failing to produce his licence, on July 16th. Superintendent Hooker asked that the summons concerning the licence might be amended to read "driving without a licence." This was agreed to, and defendant pleaded guilty. A penalty of £5 4s. in all was imposed. The other motoring defendants were fined £10 and £4 respectively.

### CLAIMS AGAINST MOTORISTS.

At the Shrewsbury County Court, before Judge Harris Lea, an action has been brought under the extended jurisdiction of the County Court, by Sarah Drew, wife of Arthur Drew, Broughton, Claverley, near Wolverhampton, to recover damages from Henry James Bath, engineer, Badger Heath, near Wolverhampton, for injuries received owing to alleged negligent driving of a motor-car by defendant. The amount claimed by the plaintiff was £100. Mr. A. Graham was for the plaintiff, and Mr. S. R. Rhodes, Wolverhampton, represented the defendant. After hearing the case his Honour said he considered the defendant did not exercise proper care. In his opinion defendant drove unnecessarily near to the horse when on the wrong side of the road, and thus frightened the animal. He had, therefore, come to the conclusion that there was negligence on the part of the defendant, but it seemed to him that the damages had been largely exaggerated. There would be judgment for the plaintiff for £35 and costs.

AN action was brought at Bristol Assizes recently by Robert Daves, a Gloucestershire farmer, against the Rev. Lionel Mackinder, vicar of Wotton-under-Edge, and his wife for damages arising out of a collision between the plaintiff's trap and the defendants' motor-car. The car belonged to Mrs. Mackinder, and on January 22nd it left London at twelve o'clock, the passengers consisting of the owner, her nurse, a maid, and a chauffeur named Ernest Thorne. While descending a hill near home it collided with the trap, and Daves was thrown out and sustained spinal concussion. Thorne was summoned for furious driving, and in his absence was committed to gaol for three months. He appealed, saying he had never been served with a summons, and the conviction was quashed. He gave evidence that the collision was the fault of the driver of the trap. A verdict was given for the plaintiff, with £250 damages.

### MOTOR-CAR ACCIDENTS.

A VERDICT of "Accidental death" was returned in the case of Mrs. Willatts, who was knocked down by a motor-car at Wokingham while following a funeral procession. One witness said there was not room for the motor-car to pass the coffin on the right side. The procession practically took up the whole of the road. Several witnesses spoke to the deceased stepping in front of the motor, the speed of which was given as from eight to ten miles an hour.

A SERIOUS motor-car accident occurred on Sunday near Wooler (Northumberland). A party of young people left Wooler for a ride to Coldstream. All went well until a bridge was reached, when one of the spokes of a road wheel gave way, causing the car to overturn, and some of the occupants were seriously injured.

A SERIOUS accident befell Mr. Albert St. John Harmsworth, who was returning from Norfolk to London, late on Wednesday of last week. Mr. Harmsworth had himself driven the car as far as Royston, where he handed over the wheel to his chauffeur, taking a seat himself in the tonneau and going to sleep. Passing Lemsford on the North Road and approaching Hatfield, about midnight, the car struck the corner bank on the Hatfield side of the road, which forks to the left to Hertford and Ware, breaking the axle and the front wheels. Both the chauffeur and Mr. Harmsworth were thrown out into the road, where they were ultimately discovered by Mr. Milburn, who motored to Hat-

field and fetched a doctor, and then to Hampstead Heath to notify Mr. Harold Harmsworth. We understand Mr. Harmsworth is going on as well as can be expected under the circumstances.

A SERIOUS accident befell the Hon. Gerald Agar-Robartes, while motoring from Bodmin to Lostwithiel with Mr. St. Clair Hutchings on Tuesday, the day of the Bodmin bye-election. As they were descending the steep hill into Lostwithiel the brakes failed, and the car dashed at a terrific pace into a hedge at the bottom and was completely wrecked. Both the occupants were flung violently out, but very fortunately escaped serious injury, and after receiving medical attention were able to return to Lord Clifden's seat at Lanhydrock.

### MOTOR-BOAT CASES.

MR. F. CHEESEWRIGHT, of Ealing, W., was summoned at Feltham on Monday, at the instance of the Thames Conservancy, for navigating the motor-launch Ferro off Sunbury-on-Thames without special care and caution when passing vessels of a smaller class. Mr. Glenshaw, who prosecuted, said the defendant's launch entered Sunbury Lock-cut at such a speed that it made a wash that was dangerous to all other craft of a smaller class in the vicinity. The Bench imposed a fine of £2, including costs.

MR. SYDNEY BROAD was summoned for a similar offence when in charge of the motor-boat Twa, at Hampton, on Sunday, June 17th. Mr. Bernard Tidy, of Hampton Hill, said he and some friends were in a punt near Garrick's Ait when the defendant's launch passed. The speed was not very great, but the wash made by the launch came over both sides of the punt and swamped them, and, rushing up the bank, it entered the punt again. A fine of £3, including costs, was imposed.

### POLICE TRAPS.

CONSIDERABLE activity is being displayed by the police on many of the main roads in South Wales.

P. S. WAGHORN has been actively engaged in laying motor traps on the London and Eastbourne roads in the neighbourhood of Framfield and Maresfield.

POLICE energy seems to have been re-awakened on the road between Coventry and Birmingham, especially in the neighbourhood of Yardley.

A POLICE trap has been arranged on the Great North Road at Alconbury, Huntingdonshire.

THE Upper Worthing road at Poling has become dangerous to motorists, a trap there having just led half a dozen before the Arundel County Bench.

WE learn that elaborate plans are being laid by the police in the Shoreham district for the purpose of intercepting all cars passing through during Goodwood week. Motorists should drive with great caution after leaving Brighton, and until quite clear of Shoreham by any road.

A TRAP is in frequent operation at Lagham cross roads, Godstone. P.S. Bailey, who has recently been in charge of the device, has declared in court that catching motorists was the simplest thing he ever had to do since he joined the police force.

MESSRS. SMITH, PARFREY AND CO., of the Pimlico Wheelworks, Hammersmith, send a supplementary pamphlet to their catalogue recently noticed in our columns.

### TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

Photographers, both professional and amateur, are invited to send photographs of current events or of motoring scenes and incidents. The fee, if any, required for reproduction should be stated in each case; otherwise no liability will be accepted.

# THE Motor-Car Journal.

## COMMENTS.

**M**EMBERS of the South of Scotland Chamber of Commerce have been discussing the railway rates question, and from examples which were quoted at the meeting it would appear that some of the charges made for the conveyance of goods from the Hawick district to London are really exorbitant. Seeing that the Caledonian, the Glasgow and South-Western, and the North British Railway Companies had agreed upon certain reductions in the rates from Glasgow to London, it was suggested that a service of motor vehicles might be run from the Borders to the Hillfoots, in order that the cheap rate might be taken advantage of, or to Kelso, Glasgow, or even Carlisle. Mr. Williamson said that the Hawick manufacturers would be unanimous in a scheme of that kind, and after further discussion the matter was remitted to Messrs. Ballantyne, Williamson, and John Roberts to consider and report. Doubtless some of our northern readers will be able to supply them with useful information on the subject.

£10,000.

THAT motorists are important, though unwilling, contributors to the expenses of criminal administration has been recognised in the southern counties to a degree not adequately realised in the North. Hence the value of the return which has appeared simultaneously with the appearance of the Royal Commission's Report, showing that the fines on motorists amount to about £10,000 a year. London, Surrey and Sussex have made the biggest hauls of the counties, the fines amounting to £1,621 in the case of London, £1,146 in the case of Surrey, and £1,597 in the case of Sussex. Of the English counties (excepting Monmouthshire) Wiltshire would appear to be the one in which motorists are the most law-abiding, fines to the amount of £7 only having been levied. Montgomeryshire shows the best record for Wales, for it has the record of not having inflicted a single fine, while the fines levied in the whole of Wales are about a sixth of those imposed in London alone.

### The Report.

Now that the long-expected Report of the Royal Commission is in the hands of the public, it may be of interest to recall the facts that led to its appointment. Prior to 1896, motor-cars could not practically be used on the roads of this country. In that year the Locomotives on Highways Act became law, by which the lighter kind of vehicles propelled by motor power were exempt from almost all the provisions of the Acts relating to locomotives on highways. These vehicles, called "light locomotives" by the Act of 1896, and "motor-cars" by that of 1903, were then made subject to new provisions. The first Act proposed no limitation of the weight which might be carried by motor-cars, but points of detail in their use were governed by regulations made by the Local Government Boards for England and Ireland

and the Secretary of Scotland for Scotland. The substantial increase of motor-car traffic subsequently led to general demands for alteration of the law, and the Motor Car Act of 1903 was introduced into the House of Lords, ultimately passing both Houses of Parliament, and being designed to expire at the end of the present year unless the period was extended. The provisions of that Act, together with the Heavy Motor Car Order of 1904, are generally known to our readers. It came into operation on the 1st of January, 1904, and by the end of the first year 27,348 motor-cycles and 24,201 cars were registered. These had increased to 37,665 motor-cycles and 36,373 cars by the 30th September last, and to 42,438 and 44,098 respectively on May 1st of the present year. The termination of the Act at the end of 1906 was the immediate necessity for a revision of the matter, and the appointment of the Royal Commission was welcomed as a fair means of arriving at some satisfactory line of public policy.

### Training Drivers.

ALTHOUGH the Royal Commission does not actually recommend any official scheme of examination of motor drivers, it is sufficiently friendly towards the examination of the A.C.G.B.I. to give the club much encouragement to persevere in its efforts to preserve the unwary from the pitfalls of the institutions that supply certificates of little value for large fees. In conjunction with the Motor Union, the Club is preparing a list of equipments necessary for a driving school, in order to obtain a licence signifying official recognition of the particular institution. Dr. Hele-Shaw is lending the weight of his knowledge and authority to the devisers of the scheme, and all will welcome any effort to raise and maintain the standard of teaching, in view of the importance of the subject to the public generally, as well as to the industry primarily concerned. On another page we give the club's suggested list of equipment for such schools.

### Ambassadorial Appreciation.

LAST week we referred to the case in which the chauffeur of the American Ambassador escaped conviction owing to the existence of an ancient law of privilege. The summons has had an interesting sequel. The Ambassador, who was in the car when the chauffeur was stopped, in appreciation of the action of the Bench, has sent to Lord Enfield a cheque for £20 for the Barnet Victoria Cottage Hospital, of which his lordship is president. Charity having thus gained, justice will doubtless be appeased.

### The Scottish Club.

So much meritorious work has been done by the Scottish Automobile Club that it has well earned the right of recognition as the premier authority in the automobile world of the northern part of Britain. The agreements lately made between this body, the A.C.G.B.I., and the Motor Union were ratified by the General Council of the Scottish club at a meeting held last week. The main points are that the Scottish

Club has the right to conduct public trials and competitions or closed events as and when they deem proper, and to control all matters relating to the automobile movement in Scotland. There will be a mutual recognition of drivers' registration and of disciplinary action. The Scottish Club will arrange and conduct examinations for driving and mechanical proficiency, and on their recommendation the A.C.G.B.I. will award certificates therefor. Every member will be, *ipso facto*, a member of the Motor Union, and the Scottish A.C. will be the administrative part of the Motor Union in Scotland, and will represent the other bodies at all inquiries under the Motor Car Act, or at any other proceedings in Scotland, where, in the interests of the movement, such representation is deemed desirable.

### Camels v. Cars.

THE Sirdar, Sir F. Wingate, has demonstrated the value of the motor-car in the Soudan, and we now learn, on official authority, that the prospects of automobilism in Egypt are improving. Motor-vehicles can at present be used only in and about Alexandria and Cairo, but some parts of the desert offer almost natural roads, and it is estimated that the cost of making many of these suitable for motor traffic would not be inordinate. An experiment has succeeded so far, and police inspection, formerly made on camels, and taking six weeks for each trip, can now be made in two weeks by means of motor-cars. In this connection Mr. John S. Napier, who has

just returned from a visit to Egypt, sends us an interesting photograph, in which a motor-car and a camel form the central objects. In a way, the picture thus presented may be taken to indicate the old "Ship of the Desert" and the new, for much of the work previously undertaken solely by means of camels is now accomplished entirely by the motor-car shown in the picture—the New Arrol-Johnston supplied some time ago to the Sirdar for use in the desert. Mr. Napier has brought home with him a very considerable number of orders, including one from the Egyptian Government for a car fitted with the new 38-45-h.p. engine.

### Against the Reckless Motorist.

THE appearance of the Earl of Lonsdale in the witness-box against the driver of a motor-car, together with the letter of Sir John Shiffner in our columns last week, affords proof of the desire of motorists to free the roads from the presence of drivers who show little concern for the comfort of those who use them reasonably and with regard to the feelings of others. In going to race meetings nowadays a great deal of motor-car traffic may be expected, and it behoves all who drive on roads so crowded to proceed with due care and propriety. When motorists act as Lord Lonsdale has done they not only administer a useful lesson to wanton offenders, but they do much to assure the public that motorists as a class are as humane as any others who drive upon the public roads.

### New Automobile Clubs.

Two new county automobile clubs—for Shropshire and Cambridgeshire—were formed last week under the auspices of the Motor Union of Great Britain and Ireland. Lord Harlech was unanimously elected President of the Shropshire Club, the secretary of which is Mr. J. J. Peele, solicitor, Shrewsbury. The Chairman of the Cambridgeshire Club is Mr. G. D. Newton, of Croxton Park, and Dr. Bindloss, of Melbourn, Cambs., is hon. secretary. Both clubs are affiliating with the Motor Union, which has now sixty-five county and district clubs included in its membership. The establishment of these new organisations is welcomed as extending the influence of the organised automobile movement for mutual defence.

### Roads.

PUBLIC opinion seems to be veering towards a recognition of the need for the road improvement so ardently desired by the motorist. Basing his views on the statement of the President of the Local Government Board with regard to the unemployed, Rev. Russell Wakefield—a well-known administrator of Metropolitan affairs—urges that there is much work to be done in connection with the improvement of road gradients, pointing out some very bad gradients, such as Harrow Hill, quite close to London. No local authority can reasonably be asked to undertake such a work, the benefits of which are shared even more by people at a distance than by those immediately in the locality. This is a point which led the conference of the National Urban District Councils' Association at Penrith on Saturday to adopt a resolution urging the Government to tax motor owners and make a grant towards maintaining and watering roads with a view of reducing the dust nuisance. He held that it was unfair that local authorities should bear the expense alone. Mr. Crookhall, of Fleetwood, said Lancashire was studded with county boroughs, and produce was carried between the boroughs by motor traction. The intermediate roads were maintained by the county, and the rateable value was slipping from the County Council's grasp. Main and secondary roads should be a national charge. Towards this view the opinion of experts seems gravitating.

### On the Way North.

ON and about the opening of the shooting season in Scotland, the roads from London to Edinburgh are being patrolled by the Automobile Association scouts, who will be prepared to render every reasonable assistance to members. These scouts will be personally inspected by Colonel W. J. Bosworth, Chairman of the Association, and Mr. Walter Gibbons, an active member of the committee, who has kindly placed his 50-h.p. Itala, which he will drive himself, at the committee's disposal. This extension of the enterprise to the northern roads is of considerable interest.

### The Prejudice of Local Authorities.

THE meeting of the Redhill Town Council on Monday should be remembered by those who believe in the impartiality of local authorities with regard to motor-car matters. The Watch Committee recommended that the salary of the head constable should be increased from £325 to £350 a year. The proposal was vigorously opposed by Alderman F. E. Barnes, a county and borough justice, who said he was surprised at the laxity of the borough police in regard to the speed of motor-cars. He had only seen one prosecution for exceeding the speed limit in the borough, yet every time he went out he saw motors travelling at the rate of thirty to forty miles an hour, to the danger of life and limb. The matter was referred back to the committee. We would remind our readers that these are the bodies who will be responsible for the imposition of the twelve-mile limit, should that clause of the Commission's report become law.

**Spoiling Each Other.**

SIR W. S. ROBSON, K.C., the Solicitor-General, in acknowledging the receipt of copies of resolutions relating to the regulation of motor-car traffic, has written to the South Shields Watch Committee stating that he does not like to commit himself to proposals of taxation without very full consideration, but he thinks the advance of the motor vehicle begins to call urgently for some remedial legislation, even if it were only in the interests of the motorists themselves. The country roads of England had become almost impassable by reason of the dust and danger to which motor-cars gave rise; in fact, motorists were now spoiling each other's sport, and under these circumstances the general public might have a better chance of being considered.

**The Motor-'bus.**

THE advent of the motor-'bu', with its acceleration of speed as compared with the more familiar form of locomotion, brings new dangers as well as fresh delights. Those who have become accustomed to jumping on and off the older 'bus when in motion must restrain their ardour when

Three hundred and thirty-two of the councils replied; 200 were in substantial agreement with all the suggestions, 100 expressed no opinion, while those which dissented from one or other of the proposals were few in number. Such a lame report really means nothing, and only on the plea that anything of an anti-motoring character just now is likely to find favour in some quarters can its publication by the Press be justified.

**The Cleansing of London Streets.**

NEARLY 100,000 vehicles enter and leave the City of London every day, and it is calculated that 22,481 pass the Bank of England in a day of twelve hours. Remembering that the great majority of these vans, carts, 'buses, &c., are drawn by horses, some idea of the necessity of constant care in the cleansing of the streets is obtainable. In the year just closed we learn from Mr. Frank Sumner, the City engineer, 83,442 van loads of dust and refuse were removed from the area under the control of the Guildhall authorities; 61 million gallons of water at 6d. per 1,000 gallons were used in the process of cleansing the streets. No fewer than 727 persons are engaged in the work, while six motor-vans are included in the vehicles that convey the refuse to the destructors at Letts'

The Derbyshire Club's Hill Climb at Haslewood Hill. Mr. H. A. Johnson's 22-28-h.p. Crossley on the stiff portion of the gradient. (See page 498).

mounting or getting down from the newer vehicle. They must also learn—as was pointed out by a coroner's jury—not to stand on the top, a proceeding associated with danger in busy thoroughfares. The recommendation of that jury that the company should raise the height of the back rail is also a wise precaution against the thoughtlessness of passengers that might well be generally insisted upon, while the uniform height of the step is a matter of primary importance to the public. These are two matters of obvious value upon which the licensing authorities might come to a decision. With regard to many other points of detail in design considerable latitude should be given, as the motor-'bus is still in its evolutionary stage—on the way, let us hope, to perfection.

**A Lame Report.**

THE Secretary of the Highways Protection League sends for publication a summary of the work done by the League during the last year. In 1905 a circular was sent to the rural district councils containing suggestions for the amendment of the existing law, and in particular a proposal for the reduction of the motor speed limit to 14 or 15 miles an hour

Wharf. These figures are eloquent with regard to the proportion of the cost of local government occasioned by the present system of traffic. And, so far as this particular section is concerned, the general adoption of the automobile is the only means of lessening the expense—by removing the cause of the refuse of the streets.

**Restrictions in Bombay.**

Now that the new rules governing motoring in the Bombay Presidency have been promulgated, there will be many motorists in India anxious for a beneficent Royal Commission to consider their effect upon the movement. All cars will have to be numbered, and registration of cars that emit smoke or visible vapour will be cancelled. There will be a fifteen mile an hour speed limit in the city. No motor vehicle may travel by night on any of the ghat roads between Poona and Mahabeshwar or on any other ghat road on which, with the previous sanction of Government, the District Magistrate has prohibited night travelling. No person may drive a motor-vehicle within the limits of Mahabeshwar, except in accordance with the written permission of the superintendent, who may grant or

refuse such permission at his absolute discretion, and may, in granting it, prescribe such general or special conditions as he thinks fit except for bona fide visitors.

#### Strange, yet True.

GEORGE FALKNER, of Walkden, near Manchester, has had the very unusual experience of being let off by the Lancaster county magistrates, though he had pleaded guilty to an offence against the Motor Car Act. He was found at Morecambe riding a motor-bicycle without an identification plate in front. He told the magistrates that he journeyed from Manchester, and that near Chorley the road was so rough that both his lamp and the front number plate were knocked off, and he left them in a shop in Chorley. The magistrates dismissed the information. This is the first time the Lancaster county magistrates have failed to impose a penalty on a motorist; hence the prominence given the occurrence in our columns.

#### Organising Garage Owners.

PROBABLY the first hint of the need for an organisation of garage proprietors appeared in our columns recently, when Mr. W. Jamieson referred to the value such an association would be in generally warning those engaged about such places of the dangers of petrol. Doubtless a little inter-communication and occasional interchange of opinions among owners of garages in some parts of the country would often be useful from a financial as well as a technical point of view. As motoring develops the character of some of the motor establishments will be expected to improve, and instead of the present haphazard plan of organisation which seems to prevail in many places the whole design and scheme of working will require to be changed, so that the economy resulting from order and first-class equipment may keep charges at a reasonable figure, as well as add to the efficiency of the work done—two points upon which no standard of perfection has yet been attained.

#### "Extraordinary Traffic."

ERE long efforts will be made by local authorities to suggest that motor-bus services in certain rural districts should be regarded as "extraordinary traffic," and dealt with accordingly. Already indications of this are apparent in the west, and the Paignton Council has approached the Devon County Council on the subject. In reply they have been told that the District Council must enforce its own claims in this respect, and the correspondence is to be sent to Mr. John Burns for the consideration of the Local Government Board. Evidently there are local people unable to appreciate the convenience and prosperity that the motor-bus is capable of introducing into the life of the country. They seem ready to thwart its progress at all points.

#### A Railway Plaint.

EVEN the "Tube" is feeling the effects of the motor-bus, which provides an open air competitor along a certain portion of the underground route of the Central London Railway Company. This fact is remarked upon by the directors in their report. Speaking at the meeting of the East London Railway Company last week, Lord Claud Hamilton attributed some of the decrease in passenger receipts to the rivalry of this new vehicle, and mentioned that the Great Eastern Railway and the London and South-Western Railway Company had suffered from the same cause. The truth is that the railway directors were slow to recognise the attractiveness of the motor-bus to the man who prefers going to business in the fresh air to being cooped up in a railway carriage. Had they been pioneers in the motor-bus movement in London they might have developed a system of exchange tickets, and have conveyed their passengers practically from home to office. Now the opportunity has gone.

## REPORT OF THE MOTOR CAR COMMISSION.

APPROACHING the past, present, and—what is more important—the future of automobilism with a judicial mind, the members of the Royal Commission on Motor Cars have emerged from their labours with the impress of such an attitude on every one of the eighty-two pages of their Report. They have sifted the evidence of 122 witnesses, representing "all sorts and conditions of men," and embracing various shades of opinion, from the deep legal blue of the man in charge of police traps to the almost ruby expletives of the person who finds his green hedgerows seared with the dust thrown up by the motor-car. All this has been analysed by the Commission with discriminating care, and considered with a knowledge increased by Captain Clive Bigham's luminous reports of the procedure of foreign countries with regard to the modern locomotion on ordinary roads. The result is the skeleton of a scheme of legislation which, by avoiding either extreme, seems well prepared for adoption, almost without variation, by the Legislature. Elsewhere we give a synopsis of the leading recommendations of the Commission; nothing is to be gained by hasty pronouncements on any of the clauses, but a few generalisations of the nature of "a first reading debate" may afford a useful guide to the many public discussions and private conversations that will take place ere the subject is brought before the House of Commons by the President of the Local Government Board, whose advocacy of quicker transit has hitherto been mainly associated with the tramcar.

There are some essential points upon which motorists are agreed. None want the illogical speed limit perpetuated. Experience has shown how unfairly it has operated; it has been utilised for the purpose of securing victims of police traps, rather than ensuring the safety of the public. In the old days, when stage coaches were in the zenith of their popularity, our forefathers, in framing the Highway Acts, never sought to define the point at which the speed of vehicles left the path of safety and went into the danger zone. They relied upon the negligence of the driver, or the furious character of his driving; and now, after an unsatisfactory experience of speed limits and police traps—we do not propose to adopt the Commission euphonious synonym of "police controls"—a return is presaged to the earlier position so far as the open country is concerned. In the retention of the speed limit for populous places we see an endeavour to placate the anti-motoring section of the community. Here probably will be the first serious difficulty of Parliament, for the regulation with regard to speed limits is to be taken from the Local Government Board and placed in the hands of the local authorities. This is a matter likely to excite controversy, and we propose to return to the point again, with a view of proving how the spirit of local prejudice might be allowed to thwart the motor movement in any particular district, and work possible hardship to motorists from a distance passing through proscribed areas. True, the present Lord Justice Moulton, in his memorable speech at the Motor Union's dinner last winter, did emphasise the matter of local regulation—a suggestion from which we dissented, with the approval of the motoring world. The position is scarcely less different to-day. Bucolic prejudice is as vehement as ever, and rural councillors as unfitted to suggest areas for restricted speed as county justices are to impartially administer the existing law with regard to motorists. On the whole the system of leaving the limitation of speed and the prohibition of cars in certain areas in the hands of the Local Government Board, at the suggestion of the local authorities, has not operated unfairly. But if the central body is to be merely the registering agency for the "red line" resolutions of district and rural councils, a great strain will be placed upon the patience of motorists.

The speed limit in its worst form having disappeared, satisfaction may be expressed with regard to the endorsement of licences. There will be an opportunity for the motorist to renew his clean record after a period of good behaviour extend-

ing over two years. Motorists have been perplexed with the present position, and have wondered how long their endorsements are to be recounted against them, because tail lamps have failed, or the police imagination has stretched to the summoning point. It is gratifying, too, to know that the endorsement will be at the option of the magistrates, which leaves a loophole of escape, and secures a discretionary power which has hitherto been lacking—constituting a grave blot upon the hasty legislation of 1903. Equally satisfactory is the extension of the right of appeal in cases of endorsement or fines of more than 20s.

Much will probably be heard of the new financial arrangements proposed by the Commission. General agreement will be found with the principle of a graduated tax. That the motorist of minor degree, with his single-cylinder car, should be taxed on an equal footing with the six-cylinder vehicle, or that the 8-h.p. voiturette should contribute to the revenue equally with the 60-h.p. vehicle, has been an anomaly which is now promised removal. It is also gratifying to find that the money derived from such taxes is to be allocated not for "ordinary and customary repairs" of the roads, but in works designed to create durable and dustless highways. In other words, the local authorities will not be able to use the money for the perpetuation of admittedly bad plans of road construction; it

of moderate means from becoming a motorist, will considerably add to his expenses. Looking at some tyre accounts lately, we have been surprised at what motorists will stand in the way of expense; so that the difference between three and five guineas is not vital, but it is serious, nevertheless, and we look to Parliamentary advocates to ensure that the large taxation thus proposed will really go to the purpose of road improvements as outlined by the Commission. Unless really adequate safeguards are given in this respect, the whole scheme of taxation should be carefully revised and readjusted, with a view of making motoring an economic possibility to the largest possible number.

Motorists have become so accustomed to being numbered like auction lots that no resentment has been felt at the retention of the numbering proposal as a general principle, nor can we quarrel with the idea of uniformity being secured by their provision by the registering authorities, but some technical difficulties may be experienced when it is sought to rigidly fix the plate—slightly larger than that now in use—at a height of not less than 2 ft. 6 in. from the ground.

In the hour of victory—for the Commission's Report is a vindication of the policy enunciated by responsible motorists during the past year or so—it may appear ungracious to remind opponents of the completeness of their defeat. But the leagues

Motoring in Paris.—On the way to the Bois de Boulogne.

will have to be employed on really scientific work calculated to be of permanent benefit to the country. Often has this idea been ventilated in motoring circles; it forms the basis of a Bill introduced into the Commons by the Hon. Arthur Stanley; and its transference to the Statute Books should not be a difficult matter. But when the Committee stage is reached, those who voice the views of motorists in Parliament will have much to say with regard to the classification advised by Viscount Selby and his colleagues. Little need be said as to the taxes of two and three guineas on cars weighing up to 15 cwt., especially in view of the allocation of the tax to works that will, primarily, be to the benefit of the motorist. The raising of the annual charge to five guineas in the case of vehicles weighing from 15 cwt. to 25 cwt. becomes an increase of importance when petrol, tools, spare parts, &c., are included. These latter, not usually considered in official trials, might well have been left out, so that vehicles on the border line of the 15 cwt. category might have been consigned to the three guinea class. As it is, many that in the ordinary way would have been below 15 cwt. will by the weight of petrol, &c., be raised into a category that, without wholly deterring the man

and other associations which were called into premature existence to secure a general reduction of the speed limit, the harassing of motorists by further regulations, and the imposition of mechanical conditions to throttle the progressive growth of the industry, have been ignored. Their position was untenable, and the Highway Canutes who called upon the progress of the motor-car industry to be stayed, must now recognise the inevitable, and be prepared to acknowledge the rights as well as the wrongs of motorism.

THERE were 131 private motor-cars and twenty-three motorcycles registered during 1905 in Calcutta, and 203 drivers' licences were issued.

THE London County Council has recently seen fit to change the name of King Street, Regent Street, W., on account of the fact that there are several King Streets in the West End of London. They have, however, agreed to call it Kingly Street instead of King Street, so that it really does not make much difference to the White Steam Car business which is conducted therefrom.

## CONTINENTAL NOTES.

### The French Odotachymeter Competition.

The result of the recent competition of speed and mileage recording instruments held by the French Automobile Club has been announced. Eleven instruments were actually tried, the first prize (£20) being awarded to the Otto Schulze apparatus, a German invention, the second prize being divided between Herr Krauss and the Cowey Engineering Company.

### Public Services in Germany.

A public motor-car service is about to be started between Mittweida, Burgstadt, and Leinbach. The municipal authorities of Rothenburg are considering a proposal to start a similar service between that town and Leutershausen. A company has just been formed at Bad Dürkheim to run motor-buses between that place and Ludwigsburg-am-Rhein. Messrs. Bussing and Co.,

—viz., four each Darracq, Brasier, Mercedes, and De Dietrich, three each Gregoire, Clement-Bayard and Hotchkiss, a Gobron and a Corre. The Panhard and Renault firms have decided to abstain from the contest. The weighing-in will take place at Bastogne on the 12th inst., and the start of the race at 7 a.m. on the 13th, the competitors being dispatched at minute intervals.

### A Touring Competition in Normandy.

The Moto-Club Normand is organising a touring competition for motor-cars and cycles for the 3rd, 4th, and 5th inst. The first day will be devoted to a series of brake tests on a hill having a gradient of 1 in 10. On the 4th inst. there is to be a run over a 45-mile circuit, which, starting and finishing at Vascoeil, takes in Gournay, Buch, and Heronchelle, the number of laps to be made varying according to the class. The event will conclude on Sunday with a flying kilometre speed trial.

The Belgian Criterium., The Competing Cars at Luxembourg.

of Brunswick, are building two 25-30-h.p. motor-buses for a service in Munich.

### An Italian Motor-Cycle and Voiturette Hill-Climbing Competition.

The Moto-Club d'Italia, in conjunction with the Italian Automobile Club, is organising a hill-climbing competition from Turin to the top of the Col de Sestrieres, a distance of 86 kilometres. The event will be held on the 26th inst., and will be open for touring motor-cycles and voiturettes.

### The Circuit des Ardennes.

It has been decided that the Circuit des Ardennes race shall be held on what is known as the Petit Circuit, which, starting and finishing at Bastogne, takes in Longlier, Leglise, Habay-la-Neuve, and Mortelange. The distance round is 85.714 kilometres, and as seven circuits have to be made, the total mileage is roundly 375. The entry list so far comprises 27 cars

### A Novel Competition.

The Moto-Club de Marseilles held a somewhat novel competition on Sunday last. It was known as the "Rallie-Postal Automobile," the competitors being dispatched from a certain point with instructions, previously kept secret, to proceed to five different post offices and collect a letter at the poste restante. According to the route chosen, the distance to be covered varied from 90 to 120 kilometres. There were twenty-five competitors, these comprising eight cars, five tri-cars, and twelve motor-cycles. The winner was M. Hamelle, who, on a 45-h.p. Mors, collected his five letters and returned to the finishing point in 2 hours 7 minutes, he having covered altogether about sixty-nine miles.

### The Boulogne Automobile Meeting.

The 90-h.p. Napier which competed for the De Caters Challenge Cup at the recent automobile meeting at Boulogne was driven by Prince de Chimay, and not by Mr. Cecil Edge.

There were only two competitors, Wagner on a 100-h.p. winning easily in 17 3-5 sec., as against 35 3-5 sec. by the Napier.

#### The Florio Cup Race.

The news that the Florio Cup race is not to be held owing to the Minister of War having declined to supply the troops necessary to guard the course has caused great consternation throughout Italy, and in some of the towns and villages on the Brescia circuit, on which the event was to have been held, disturbances have taken place. The Government has, however, confirmed the action of the War Department, so that there is little or no likelihood of the race being run this year.

#### The Belgian Criterium.

The 1,000-kilometre reliability trial for touring cars held under the auspices of the Belgian Spa, and Namur and Luxembourg Automobile Clubs, was concluded last week, forty-three out of the forty-seven which started successfully completing the five days' tour. The great event on the 26th ult. was the 500-kilometre race on the Circuit de la Meuse, for the surviving cars in Class I. The course, which, starting and finishing at Dinant, took in Bievre, Hondremont and Gedinne, had to be covered five times by the drivers in Categories 4, 5, and 6; and four times by those in Category 3. Thirty-one competitors qualified for the contest, in which twenty-nine started and seventeen finished. The results are appended:—

##### CATEGORY 6, CLASS I.

	H.	M.	S.
1. Hautvast (Pipe) ... ..	6	45	14
2. Croquet (Darracq) ... ..	6	57	25

##### CATEGORY 5, CLASS I.

1. Rigolly (Gobron) ... ..	7	28	37
2. Elskamp (Gobron) ... ..	7	38	56
3. Van Langendonck (Fiat) ... ..	8	25	22
4. Vanderstege (Fiat) ... ..	8	37	39
5. Eynard (Gobron) ... ..	8	45	20
6. Jacobs (Aries) ... ..	9	16	36
7. Cuenod (Martini) ... ..	9	41	5

##### CATEGORY 4, CLASS I.

1. Fischer (Vivinus) ... ..	8	7	45
2. De Vasselot (Pipe) ... ..	8	10	13
3. Vienne (Pipe) ... ..	9	5	45
4. Christiaens (N.A.G.) ... ..	9	17	32
5. Boudart (Darracq) ... ..	9	25	23
6. Pinard (N.A.G.) ... ..	9	28	28

##### CATEGORY 3, CLASS I.

1. Coquard (Aries) ... ..	7	32	27
2. Vlemineckx (Metallurgique) ... ..	8	24	59

Hautvast's car is rated at 50-h.p.; his average speed works out at just over 46 miles per hour. On Friday, the 27th ult., the competitors had to take part in a hill-climbing contest on the Malchamps Hill, Spa, over a distance of five and a-half kil., the best times in Class 1 being:—Category 6, Hautvast (Pipe), 4 min. 23 sec.; Category 5, Rigolly (Gobron), 5 min. 1 sec.; Category 4, Vienne (Pipe), 6 min. 53 sec.; Category 3, M. Vlemineckx (Metallurgique); and Category 2, Martin (Metallurgique), 9 min. 12 sec. In Class 2, the winner of Category 5 was M. Grisard (Rochet-Schneider), he having survived the five days' tour and made the best time (5 min. 38 3-5 sec.) on the hill. Dandoy, on a Darracq, was first in Category 2 (12 min. 57 sec.). A series of flying kilometre speed trials on the Malchamps Hill was also held, Hautvast, on a Pipe, making the best time—43 sec. It was afterwards decided to cancel this event. Hautvast carries off the prize offered by the Belgian Government for the first Belgian car in the contest, he having completed the 500 kilometre tour on his Pipe car at an average speed of 47 miles per hour. Rigolly (Gobron) secures the Coupe de Spa for the first foreign vehicle while Barriaux (Vielpes) wins the prize offered by the Belgian Club for the lowest-powered car accomplishing the trial with the greatest regularity in running.

#### Miscellaneous Items.

The Moto-Club Oranais has just been formed at Oran, Algeria.—The municipal authorities of Tours have fixed 10 kilometres per hour (6½ miles) as the maximum speed at which motor-cars must pass through the town.—The Cesky Automobile Club, of Prague, proposes to hold in the autumn a reliability trial of voiturettes and light cars from Prague to Patzau and back.

## THE FORMAN 28-30-H.P. MOTOR.

ONE of the latest productions of the Forman Motor Company, Ltd., of Coventry, is the 28-30-h.p. engine, of which we give an illustration herewith. As will be seen, the four cylinders, which are 110 mm. bore by 130 mm. stroke, are cast in two pairs. The crank shaft is of liberal dimensions and runs on large centre and end bearings of phosphor bronze. The crank case is divided into two parts, bolted horizontally, the lower half being readily detachable. An inspection door is also provided to permit the big ends to be readily inspected. The valves are all mechanically actuated off a single cam shaft, the inlets being furnished with a variable lift obtained by means of sliding cams fitted to a shaft which can be moved to and fro in a length of steel tubing. By means of this arrangement, which is controlled from the steering wheel, any desired rate of engine can be obtained. The cam shaft gearing is enclosed in an aluminium case at the forward end of the motor. As to ignition, two systems are provided for—the ordinary accumulator system and high tension magneto. The contact maker for the former is located on the upper end of a vertical spindle driven by bevel gearing off the cam shaft. The magneto is carried on a bracket, which forms part of the crank case, and is driven by gear wheels off the crank shaft. The

General View of Valve Side of Forman 28-30-h.p. Motor.

design of the engine throughout has been well thought out, special attention having been devoted to the bearings, which have been designed to give the motor a long life, rendering it as well suited for bus work as for touring cars. For the former purpose, however, the Forman Company recommend that the crank case be made of malleable iron or gun metal rather than aluminium.

THE "Roberts" Non Skid Band Company, of St. Mary's Row, Birmingham, is having a busy season with the firm's detachable non-skid tyre protector, which is fitted with a renewable tread and instantaneous adjustment. Being absolutely rigid it can be depended upon not to creep, while a matter of convenience is afforded by the very small space it occupies when not in use. An 810 by 90 protector can be folded into a space 15 in. by 4 in. by 3 in. The device can be fitted to worn tyres equally as well as to new ones.

FROM the Avon Motor Manufacturing Company, of Keynsham, near Bristol, comes a copy of the 1906 catalogue of "Avon" cars. These comprise a 6-h.p. tri-mobile, a 6-h.p. two-seated car, a 6-h.p. light van, a 6-h.p. semi-delivery car, and a 10-h.p. double-cylinder tonneau. The object of the makers is to meet the demand for low-priced reliable vehicles; special attention has also been devoted to the question of keeping the cost of running expenses on an equally low scale.

## AN IMPROVED SILENCER FOR PETROL MOTORS.

WE illustrate herewith a new silencer for petrol motors which has recently been put on the market by Pratt's Patent Manufacturing Company, of Dukinfield, Cheshire. The object of this arrangement is to allow the exhaust gases, on leaving the engine under pressure, to undergo a certain amount of expansion before emerging from the silencer, whereby the sudden impact of the exhaust against the atmospheric pressure is greatly reduced, and hence the silencing is rendered much more effective. The casing of the silencer is composed of two metal cylinders, one made to fit inside the other, with a sheet of asbestos between them, the latter acting as a non-conductor of heat, and also serving to muffle the sound. The cylinders are fitted together by means of metal ends, with

Sectional View of Pratt's Expansion Silencer.

holes in the centre; through the latter, as will be seen, passes a central tube, screwed externally at each end, and provided with nut and outer cap to fix all firmly together. The tube, which is perforated with a number of holes, also contains a stop. Fitting close on the tube, but so as to easily slide backwards and forwards thereon, are two discs or stops, which are perforated with a number of holes; they are also rather smaller in diameter than the inside cylinder. These discs are attached to brass bosses or bearings, on each side of which is a spiral spring. The operation of the silencer is as follows:—The exhaust gas on leaving the engine under pressure enters the tube at the inlet opening, and passes through the holes into the outer chamber, forcing the discs forward against the action of the springs, thus causing the chamber to enlarge or expand. The reaction of the springs gradually forces the discs back again as the gas passes through the small perforations above mentioned. The gas then passes through the second lot of holes into the central tube, along this towards the inlet end, then through the third series of holes into the outer casing, and finally through a fourth set of holes into the atmosphere. The makers claim that the action of this silencer causes the exhaust to extend over a longer period than usual, and does away with the rapid puffing sound and renders it extremely silent. The apparatus is made in a variety of sizes suitable for cars of any power and with any number of cylinders.

ACCORDING to an attractive pamphlet issued by Messrs. Mann, Egerton and Co., Ltd., Norwich is an ideal centre for a motor tour, being in the centre of the Broads, within easy reach of a dozen seaside resorts and an equal number of golf links, while the roads in the county are exceptionally good. They have a garage with capacity for 200 cars, repair shop with a staff capable of effecting any class of motor repairs, and knowledge of automobilism that will be extremely useful to motorists journeying that way.

A FEW days ago we had a short run on a 9-h.p. Clyde two-cylinder car, and were struck by its flexibility and ease of control in traffic. This no doubt is accounted for by the transmission gear, which is not only silent, but gives a direct drive on each speed, the pinions being always in mesh. Although only a two-seater, the vehicle carried three persons up a gradient of 1 in 7 at a good speed on the second gear. Mr. G. H. Wait, Leicester, the designer, informs us that the car is meeting with considerable favour, especially amongst medical men. We may add that Mr. Wait is engaged on the construction of a 24–30-h.p. Clyde, to which we hope to refer in a subsequent issue.

## HERE AND THERE.

MESSRS. BOON AND PORTER have opened a garage at 161, Castelnau, Barnes.

MR. W. CHRISTY is developing his business in George Street, Limerick, as a motor-car agent.

A MOTOR-CAR, costing £650, is to be purchased for the county engineer of Middlesex by the County Council.

A NEW six-cylinder car is approaching completion at the works of Messrs. Hurst and Middleton, at Holloway, N.

FROM the Adams Manufacturing Company, Ltd., comes a coloured illustration of an Adams-Hewitt car at Godshill, Isle of Wight.

THE Lord Mayor of London and the Lady Mayoress left the Mansion House on Monday for Llandrindod Wells, in Wales, travelling by motor-car.

MESSRS. ERNEST ARNOTT AND HOLLOWAY, LTD., have opened new showrooms at 17, Old Burlington Street, W., and are showing the new 40-h.p. six-cylinder Minerva cars.

THE municipal authorities of Los Angeles, California, have passed a regulation requiring that all motor-cycles be equipped with silencers, and that the same are to be kept closed within the city limits.

MR. T. B. HYSLOP, medical superintendent of Bethlehem Hospital, has consented to read a paper at the Conference of Sanitary Inspectors at Blackpool next month on the effects of motor traffic on the brain.

THE Marquess of Lansdowne has just bought the chassis of an 18-h.p. White steam car, upon which he is going to have a landaulet body built. Other recent patrons of the White steam car are Earl Wemyss, Lord Blythswood, Sir John Edwards-Moss, and Sir Dudley Duckworth King.

THE accompanying illustrations show a new locking washer known as the "Positive," which has recently been put on the market by the Positive Locking Washer Company, Ltd., of York Grove, Queen's Road, London, S.E. The device is claimed to afford an efficient and economical method of securing bolt nuts and set screws where great vibration has to be resisted, and to

obviate the need of lock nuts, castle nuts and cotter pins. It is used like the ordinary washer, with the exception that an indentation is made in the work with a breast-drill or punch to take the nib; the nut or bolt is then tightened, and the lap is struck into position, so forming a firm grip. The lap is grooved or channelled on one side radially of the washer, in order that the necessary adjustment of the nut may be made.

THE British Motor Tourists' A.B.C. has been issued by the New Alphabetic Press, Ltd., and affords a ready guide to the towns and villages of Great Britain and Ireland. These are arranged alphabetically, and the principal hotels, garages, charging stations, and petrol dealers in each place are set forth for the convenience of motorists on tour. There are two or three preliminary articles, some useful hints on legal matters, and lists of organisations associated with motorism. The volume has been issued at an opportune time.

MR. H. F. LOCKE KING proposes to construct a three-miles motor track on his estate at Weybridge.

FROM Messrs. J. E. Hutton, Ltd., comes a copy of the new catalogue of Mercedes, Panhard, and Berliet cars, for which they are agents.

THE municipal authorities of Philadelphia have just acquired twenty-four motor-bicycles for the use of the Bureau of Police in enforcing the local motor-car regulations.

ON Monday, General Booth, of the Salvation Army, set forth on his third motor tour. Starting from Inverness, he hopes to visit 150 towns and journey 1,700 miles ere reaching Plymouth.

TURNER'S MOTOR MANUFACTURING CO., LTD., Wolverhampton, have recently completed a Turner-Miesse steam lorry to the order of Messrs. E. H. Hunter and Co., of London, E.C., for shipment to Japan.

FROM the Automobile Log Syndicate, of Mansion House Chambers, London, E.C., comes an illustrated catalogue of Soar's patent automatic speed-recording log and speed indicator. We may add that the device was described in the *M.C.J.* of June 17th, 1905.

MESSRS. J. W. BROOKE AND CO., LTD., Lowestoft, have sent us a photograph of the 20 ft. motor-boat they have entered for the Reliability Trials at Southampton. The vessel is clinker built in elm, and equipped with a Brooke 8-h.p. two-cylinder motor, which gives a speed of approximately nine miles per hour.

FOR those possessed of cars which are not equipped with steering wheel engine control the E. M. Bowden Patents Syndicate have devised an application of their mechanism which

enables the most obsolete vehicle to be brought up to date in these particulars. The equipment consists of a pair of levers and sector with suitable fittings for a hollow steering-wheel pillar, or, in the case of a solid column, a pair of levers set on a projecting plate held in place by a nut. These levers are connected with two lengths of Bowden wire mechanism, and are carried along the pillar through the dashboard, and terminate as shown in the illustration, which indicates the carburettor in position. A is a clip fixed to any suitable projection of the engine or frame, and is merely intended to provide an anchorage for the light coiled spring B. The action of these coiled springs, which are set divergently, is merely to pull against the operation of the Bowden mechanism, so that, when released, the lever plate D will resume its normal position. G is a stop plate fitted with stops E and F, into which the outer or coiled sections of the mechanism enter and are held, the wire cable itself being continued through the stops to the studs C, on the lever plate D. The operation of the device is self-explanatory. The lever plate D carries internally a throttle, and the actuation of the lever on the steering-wheel plate operates the lever plate on the carburettor to open or shut the throttle as desired, the throttle remaining exactly as set in any position.

MESSRS. A. DONALDSON AND CO., LTD., of Edinburgh, are opening a new motor garage and repair shop in conjunction with the Palace Hotel of Inverness, where it is their intention to keep a competent staff and to cater generally for motorists' requirements. The premises have been erected specially to suit the purpose.

THE "Handy Touring Atlas of the British Isles," just published by Messrs. George Newnes, Ltd., has been specially prepared for motorists and travellers by Mr. J. G. Bartholomew. The scale has been reduced from the Ordnance Survey, and both main and secondary roads are shown. The motor routes which are also furnished will be of value to all travellers, and Messrs. Newnes are to be congratulated on the excellence of their latest publication.

MR. A. H. D. ALTREE has been appointed manager of the magneto department of the Simms Manufacturing Co., Ltd.

CAPTAIN GOODLAKE, of the Tralee (Ireland) Motor Garage, will shortly open a repair shop equipped to undertake all descriptions of motor work.

THE fees of the A.C.G.B.I. for long-distance trials have been revised so that the minimum is now £21 for a trial which starts from and finishes in London.

THE 30-h.p. Wolseley-Siddeley 'bus has now completed over 10,000 miles running with the London General Omnibus Co., and has proved itself to be one of the most reliable vehicles on the road.

MESSRS. ALFRED DUNHILL, LTD., have issued their new catalogue of motor clothing in three sections, each of which is fully illustrated and descriptive of their new designs. The "Book of Liveries" is chiefly concerned with leather clothing and uniforms in Melton and other cloths, and will be of service to Society motorists on the look-out for fashionable leather suits, &c., for their drivers. The section devoted to "Men's Attire" is equally complete. The third division of the catalogue is entitled "Creations for Ladies," and here veils and hoods form a specially large section of an interesting publication.

THE Argyll works at Alexandria, N.B., are certainly the most important industrial enterprise in the Vale of Leven, and some few details with regard to their capacity may be of interest. Electricity for the whole of the establishment is produced in the power-house, which is equipped with nine Rodger-Rowden gas engines of 100-h.p. each. The coach-building shop is 422 ft. by 100 ft., the painting and upholstery shop being of the same length but 65 ft. in width. In the chassis-erecting shop it is possible to have 130 chassis on the floor at one time, leaving room for forty complete cars. The total frontage of the works is 760 ft., made up as follows:—Office block, 550 ft.; machine shop, 150 ft.; lodge, 34 ft.; and chassis shop, 26 ft. The splendid entrance hall is 45 ft. square, and the entire north side of the long corridor, running along the centre of the building to a length of 425 ft., is devoted to the administrative part of the work, while the south side is devoted to recreation purposes. The total cost, exclusive of machinery, will not be much less than £150,000.

THE "Windham" Sliding Detachable Body Company, since their *début* into the motor world, have made several important additions and improvements in the construction of their sliding detachable motor-car bodies. As the design stands to-day, the mere fact that a spacious double landaulet body can be removed by one man without the use of any implement in less than one minute is sufficient in itself to show that the firm have left no stone unturned to make their bodies similar in every detail, appearance, seating capacity, comfort, &c., to the ordinary fixed body, and at the same time to make them readily and easily detachable, and without injury to the paintwork. The advantages of a detachable body are, of course, apparent to everyone; the vast increase in the landaulet type of body proves that the majority of motorists desire something which can be used for wet or fine weather as well as for day or night work. The three great points that have been kept in mind in building bodies of the detachable kind are:—(1) That the appearance of the body is in no way affected; (2) that it is made easily detachable; (3) that when fixed it cannot rattle. It is especially in regard to the latter item that it may be said lies the whole nucleus or idea of the Windham arrangement, rattling being impossible, as each body is secured at the base, and nothing is added to or attached above which might induce or cause a rattle. The firm have protected under three patents every part of the invention. They do not, however, monopolise the building of these bodies, but allow any coachbuilder to construct them under a small royalty, the company supplying the necessary fittings. On the occasion of a recent visit to the works at Altenburg Gardens, Clapham Junction, S.W., we saw a number of bodies of different descriptions in various stages of construction, and we may add that a car which has been fitted with one of the detachable bodies for fifteen months or so is kept on hand ready for trial purposes over a specially bad piece of road.

## THE SCOTTISH RELIABILITY TRIALS.

WE are able this week to give the results of the Reliability Trial which took place in Scotland in June last, and the incidents of which were fully reported and illustrated in our issue of the 20th of that month. The trial consisted of a tour of 671½ miles extending over four days, the route comprising highland and mountainous roads providing a test of the utmost severity. On each day's run there was a timed hill-climbing test, but the trial route, it should be noted, included hills of greater length and of steeper gradients than those on which the timed tests were made. The highest number of marks possible is 1,000, proportioned as follows:—Reliability, 800; time in hill-climbing tests, 100; lowest fuel consumption per ton-mile, 100.

In each class a gold medal has been awarded, the vehicles thus distinguished being as follows:—

CLASS 1.—For vehicles the chassis price of which did not exceed £200: The 9-h.p. Swift entered by the Swift Motor Company, Ltd., and driven by Mr. R. H. Every. This gained 995.5 marks.

CLASS 2.—For vehicles the chassis price of which exceeds £200 but does not exceed £350: 12-15-h.p. New Arrol-Johnston, entered by Mr. John Hunter, and driven by Mr. E. A. Rosenheim. This gained 964.8 marks.

CLASS 3.—For vehicles the chassis price of which exceeds £350 but does not exceed £500: 12-16-h.p. Wilson-Pilcher, entered by Sir W. G. Armstrong, Whitworth and Company, Ltd., and driven by Mr. G. H. T. Slaney. This gained 958.9 marks.

CLASS 4.—For vehicles the chassis price of which exceeds £500 but does not exceed £650: 20-32-h.p. Special Darracq, entered by the Kennedy Motor Company, Ltd., and driven by Mr. S. Girling. This gained 975.3 marks.

CLASS 5.—Vehicles the chassis price of which exceeds £650: 25-36-h.p. Brasier, entered by Mann and Overtons, Ltd., and driven by Mr. M. Ross Browne. This gained 977.6 marks.

The Scottish Cup for the vehicle showing the lowest fuel consumption per ton-mile over the whole Trial has been gained by the 10-h.p. Darracq, entered by the Kennedy Motor Company, Ltd., and driven by Mr. Andrew Brown, with a consumption of 0.2395 gallons per ton-mile, equal to 41.7 ton-miles per gallon of fuel.

## SUMMARY OF RESULTS IN ORDER OF TOTAL MARKS GAINED.

Car Miles per Gallon.	Car.	Marks for Reliability.	Marks gained for Fuel Consumption.	Marks Gained for Hill Climbs.	Total Marks Gained.
CLASS 1. (Under £200.)					
36.0	9-10-h.p. Swift ... G.M.	799	100.0	96.5	995.5
37.3	8-h.p. Rover ...	799	91.5	86.9	957.4
26.2	9-10-h.p. Cadillac ...	800	74.1	70.05	944.15
	9-10-h.p. Adams-Hewitt ...	791	73.8	74.4	939.2
22.8	8-h.p. Maxwell ...	768	54.8	77.6	900.4
18.2	14-h.p. Pope Tribune ...	739	63.9	47.9	850.8
—	6-h.p. Rover ...	W. 2	—	—	—
CLASS 2. (£200 to £350.)					
28.4	12-15-h.p. New Arrol-Johnston ... G.M.	794	94.9	75.9	964.8
38.1	10-h.p. Darracq ... S.C.	788	100.0	70.4	958.4
20.0	10-12-h.p. Coventry ...	799	61.6	93.0	953.6
23.3	16-h.p. Albion ...	800	80.6	65.2	945.8
15.2	14-h.p. Vulcan ...	795	48.5	99.3	942.8
20.1	16-h.p. Reo ...	798	55.9	80.6	934.5
31.2	10-h.p. Argyll ...	767	83.0	76.2	926.2
23.9	10-h.p. Alldays ...	790	52.52	72.0	914.52
17.9	10-12-h.p. Argyll ...	799	55.8	51.2	906.0
14.7	16-h.p. Maxwell ...	800	39.8	63.7	903.5
22.5	16-h.p. Kelvin ...	784	60.3	52.3	896.6
19.3	12-14-h.p. Scottish Aster ...	785	65.2	40.7	890.9
—	14-17-h.p. Scout ...	W. 4	—	—	—
—	12-14-h.p. Victoria ...	W. 4	—	—	—
CLASS 3. (£350 to £500.)					
23.0	12-16-h.p. Wilson-Pilcher ... G.M.	800	91.8	67.1	958.9
21.2	15-h.p. Darracq ...	800	77.4	80.0	957.4
19.8	14-22-h.p. Germain ...	800	68.7	88.4	957.1

Car Miles per Gallon.	Car.	Marks for Reliability.	Marks gained for Fuel Consumption.	Marks Gained for Hill Climbs.	Total Marks Gained.
22.5	16-20-h.p. Sunbeam ...	800	86.5	69.8	956.3
20.1	15-h.p. Siddeley ...	800	78.2	74.9	953.1
16.1	24-h.p. Mass ...	786	65.7	98.4	950.1
17.1	16-20-h.p. Beeston Humber ...	791	67.6	84.7	943.3
16.3	16-20-h.p. Argyll ...	800	65.4	69.9	935.3
18.9	15-h.p. De Dion ...	800	76.8	57.8	934.6
21.7	12-14-h.p. Argyll ...	799	79.1	45.3	923.4
13.5	22-h.p. Minerva ...	787	51.3	84.9	923.2
27.9	12-h.p. Arrol-Johnston Dogcart ...	786	100.0	33.6	919.6
17.8	14-16-h.p. Argyll ...	754	63.9	58.6	876.5
12.5	20-22-h.p. Mobile ...	754	51.4	68.9	874.3
15.2	12-16-h.p. Clement-Talbot ...	745	50.4	59.6	855.0
11.2	14-20-h.p. Vinot ...	767	46.51	33.7	847.21
11.2	16-20-h.p. Chenard and Walcker ...	755	39.8	24.6	819.4

13.7	30-40-h.p. Martini ...	795	85.4	63.8	949.2
11.4	30-40-h.p. Beeston Humber ...	783	64.2	78.9	935.1
12.1	35-h.p. Ariel Simplex ...	774	76.6	81.4	932.3
—	30-40-h.p. Peugeot ...	W. 2	—	—	—
—	24-34-h.p. Belsize ...	W. 2	—	—	—

G. M.—Gold Medal.

S. C.—Scottish Cup.

All vehicles with 800 marks for reliability have qualified for non stop certificates.

W. Withdraw 1st, 2nd, 3rd or 4th day.

AMONG the motor garages pleasantly located on Scottish lochs are those of the Loch Awe Hotel; the Tarbet Hotel, Loch Lomond; and Creggan's Hotel, Strachur, Loch Fyne.

## CORRESPONDENCE

[Letters to the Editor should be addressed to the offices,  
27-33, Charing Cross Road, W.C.]

### PRESSURE OR GRAVITY FEED FOR CARBURETTORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read with much interest the article and letters appearing in the *M.C.J.* with regard to the above subject, and if I may be allowed to express an opinion, I must state that I have found the pressure feed all round the much more satisfactory of the two. In the first case, I have always found pressure-fed motors are not so subject to that mysterious variation in running that one sometimes gets through gravity feed, which is generally accounted for by the varying head on the petrol, owing to the different gradients encountered in driving. Also on this same point, one very often comes across owners of cars having gravity-fed carburettors who find that their tanks must hold a certain quantity of petrol to get the best results, and that in consequence when the tank does not hold this exact quantity, or thereabouts, they complain that their engines do not run as regularly or consistently.

Dr. L. Palmer, of Featherston, New Zealand, on his 6-h.p. Wolseley. During the past year Dr. Palmer has driven the car over 10,000 miles without serious mishap.

Also, the point Mr. Hutton brings up is very common with a gravity-fed car in an exceptionally hilly district, and that is of being able, owing to the gradient, of setting the carburettor at a higher level than the petrol tank, so that it necessitates turning the car and running up hill backwards, in order to enable the petrol to flow to the carburettor.

Criticising the pressure feed, in the first case, one gets the advantage, under all circumstances of driving, of getting a regular supply of petrol. The pressure valve and fittings, being carefully made and fitted, with a little attention should give little or no trouble—in fact, no more trouble than the cock on the gravity tank, which I have found is very apt to leak and give just as much trouble in that way as the pressure valve will on the pressure system, which in both cases should be very insignificant. As regards the comparison of safety, personally I do not think there is anything in it. I must say I would rather handle a pressure-fed car in case of fire, as it is possible in case of a broken petrol pipe to let off the pressure, when immediately the flow of petrol ceases; but it certainly is a most difficult matter should a leak take place in the gravity system, as generally this goes on for some time before it is discovered, and if it is anywhere about the outlet cock of the tank, it is generally a very difficult matter to stop the petrol from continuing to leak out.

Of course, in cost, the pressure system is more expensive to fit than the gravity, and I think, as it is now being adopted by the large majority of makers, that this can be considered as a strong enough argument in favour of the pressure *versus* gravity feed for carburettors.—Yours truly,

PERCY RICHARDSON.

### HILL CLIMBING CONTESTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In answer to Mr. W. E. Furneaux's letter respecting the North Eastern Automobile Association having been rash enough to admit steam cars to their hill-climbing contest, may I say that he seems very bigoted over the affair. Why not let steam compete, especially as he states some of the finest petrol cars belong to the members of the above association, and of course would be most likely to compete? He states the promoters paid the steamers the compliment of classifying them as equivalent to an eight-cylinder petrol car. I do not think such makers as Turner Miesse, White, Stanley, Serpollet, and others care whether it is compared with eight or sixteen cylinders. Again, he wishes for some formula worked out that will not bring the steam cars to the top; but his idea is that it must be done through the A.C.G.B.I.—a member or members of the above to invent and prove the efficiency of a formula which will work out so as to permit petrol cars to clearly prove their superiority over steam, as he states, without actually excluding the latter. If Mr. Furneaux wishes to prevent steam coming out on top he should let them compete in all contests, so that it will push makers of petrol cars to invent or make petrol cars nearly or equivalent in power to steam. Why does he not suggest some power or law to restrict makers not to over-estimate the power of cars; probably Mr. Furneaux has one, and is surprised he cannot do what the makers represented the power to be.

As a spectator at the hill climbing competition advertised on page iii. of the *M.C.J.* for July 21, one cannot look without surprise at the vast difference between the steam and petrol cars, 18 h.p. steam beating 60-h.p. petrol by nearly 19 sec. If Mr. Furneaux should be competing in the N.E. contest, I wish him every success, but if steam be allowed to compete I am afraid he will have to take a back seat; and if steam should win they will do so without making a noise or stink.—Yours truly,

E. O. ROPER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Where does the "unfair comparison" mentioned by your correspondent, Mr. W. E. Furneaux, exist? And why should "our finest petrol cars" be protected? Why should the best steam cars not be allowed to compete on level terms, horse-power for horse-power, against petrol or any other class of motor-car? Surely a car ought to be judged by its performances and not by sentiment.

I may say that I have driven an 8-10-h.p. four-cylinder car of a well-known English make for over a year, and a very good little car it has proved, and an excellent hill-climber, but I have almost decided to invest in a steam car next year. I live in a hilly country, and from what I have seen of steamers I would have an easier time on the latter.—Yours truly,

FAIR PLAY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to the correspondence *re* the particular formula which should be adopted for deciding the handicapping of hill climbs, speed trials, &c., it seems to me that too much attention should not be paid to the widely divergent formulæ in use by handicappers throughout the country, as clearly it is practically impossible to create a formula to suit every car.

Formulæ are largely a matter of individual opinion, and in some cases suit one car, in others another: thus, at Blackdown Hill climb, the first five places in the handicap were won by Daimlers. Other makes of cars win on other formulæ, and it seems a pity that so much attention should be given to a controversy which would appear to have been started by a certain manufacturer for the object of advertising his own car and deceiving others.

The question for the public is not so much the exact number of millimetres in the bore and stroke of any engine they may fancy, but rather whether, for a certain fixed sum, they can obtain good results. In other words, many of these competitions are run under a price classification, and if a man can obtain a car for, say, £800, which will make faster time over a certain course or hill than any other car at a similar price, I do not think he will trouble his head very much about the various bores and strokes of other cars on sale at that price.

If human nature remain as it was, a man is largely influenced by his pocket, and I have little doubt that prospective purchasers will not be misled by the red herring of cylinder capacity which is being drawn across their track by interested parties.

Prices being equal, what the public want and have always admired is the car which gets to the top first, or in the fastest time.—Yours truly,

ARTHUR SHRAPNEL.

### DRIVERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have for the past six years taken your valuable paper, and should like to say a few words on the drivers' question. For the last fifteen years I have had the repair and charge of machinery (both

steam and internal combustion), and am well acquainted with the construction of motor-cars, am a motor-cyclist, and have for some time had a desire for motor driving. A short time ago I heard of a gentleman having a new car costing over £1,000. I offered my service with first-class character, and was told, on applying, the coachman was to drive the car.

Now, Sir, what is the use of men of experience (leaving out of the question men with a month's knowledge) thinking of entering the motor line, when employers prefer to have men with no mechanical skill. Would some of those employers, and there are a lot of them in the country, trust their lives behind such men in charge of our express locomotives and Atlantic greyhounds?—Yours truly,

CROSSHEAD.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In answer to Mr. Richardson's letter re drivers, I am surprised at a gentleman with years of experience making such statements. Will he kindly state what wages were offered when he found it difficult to get drivers?

I wanted a berth last year, so was recommended to a gentleman, who asked me to bring references. After examining my first-class Board of Trade engineer's certificate, he offered 35s. per week. Of course, plenty of such gentlemen want engineers, no doubt.—Yours truly,

S. THORNTON.

SOME EMERGENCY TYRE HINTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—To suddenly find yourself with a punctured tyre on a country road, beyond reach of help and without the necessary repairing outfit, may mean lack of forethought, and even carelessness, but it is none the less an awkward situation, and your readers may be interested to learn a way out of such a difficulty which served me a short time since.

A Motor Bicycle Contest.

The Start of one of the Heats in the Touring Car Speed Trials.

THE SCHEVENINGEN AUTOMOBILE WEEK.

[De Auto.

Having found myself in the above unhappy plight without even the hope of meeting a friendly motorist to lend me his aid, I considered the wisest course to take off the tyre and run to the nearest village on the rim, for both cover and tube were new, and I did not relish the idea of spoiling either. While engaged in this operation I gave vent to my feelings by flinging my cap to the ground, and in its fall the sun reflecting on the clip fastening the top to the peak, which was of the type adopted for fastening gloves, caught my eye. Here was a little hint given me by providence, and I clutched at it with most happy results. I first set to work to find my puncture, and here again fortune favoured me, for it was a very small hole. Then removing the clip from my cap I succeeded, by stretching the tube, in getting the studded part inside, leaving the stud protruding. Then, clipping the top button firmly on, I joyfully replaced the tube and fixed the cover over it.

I had rejoiced too quickly, however, for after a fruitless search I discovered I had left my pump at home, and, as though in mockery, I hauled out the rubber tube connection. I hunted still further, looking in every possible and impossible place where the pump might have been left, but only succeeded in finding a small coil of fine copper wire. I remembered hearing of an invention by which a tyre could be inflated from one of the cylinders, while running the engine with the other; this recollection, although not practicable through the lack of the proper fitting on the engine, was nevertheless encouraging, as it gave me an idea. The only thing needed was a connection of tubing long enough to connect the engine to the tyre, and as I only had about one foot of rubber available, I depended upon the oil feed pipes to supplement the difference. I selected the copper pipe which supplies the petrol to the float chamber for my purpose, as being cleaner than the others, which carry oil, and, turning off the tap near the tank, I disconnected the pipe and attached a small piece of rubber at each end of it. The necessary improvised pipe being ready, the next thing was to secure one end firmly on the compression tap and the other to the valve on the tyre, then, by opening the two compression taps, the

pump was ready for use. All that now remained to complete the operation was to turn the starting handle of the car, which had the desired effect of inflating the tyre. Thus my improvised apparatus, though rather crude, repaid me for my trouble and enabled me to return home in good time.—Yours truly,

CHAS. P. SOUTHWOOD.

ACCUMULATOR CHARGING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to Mr. C. Collin, I must confess that I have been more than delighted with the results obtained from my Boron cells. I have a six-cell parallel set, with which I keep all my accumulators, numbering in all 14, and varying in size from 20 to 80 amp. hours, in first-class condition. They cost me upon an average about 4d. per charge per 40 amp. hour accumulator. I have also two lamps with reflectors for lighting my motor house, and which I find extremely useful for inspection purposes.—Yours truly,

CHARLES KNIGHT.

A STEAM CAR CHALLENGE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have returned from my vacation tour in France and find that considerable correspondence on the steam car subject has been going on, on some points of which I venture to express an opinion. Mr. S. F. Edge has written to the papers objecting to the fact that steam cars are not handicapped when running in competition with petrol cars for the reason that they are "used in these hill-climbing competitions with a steam pressure of 1,200 to 1,300 lbs." The only reason that I have ever produced a large pressure of steam is that it allows me to start away from standing position and within a matter of 100 yards approximate ordinary road conditions as far as the supply of

fire and water is concerned. The large pressure of steam which I gather in the  $\frac{3}{4}$  in. tubing of my generator is really a very small volume of steam indeed, and lasts me for a very short time. Fifty yards away from the starting line at any of the hill climbs which I have been in this year, my car has been running in just the same shape as it would be run along the open road as far as steam supply is concerned. The pressure under such circumstances is in the neighbourhood of 250 to 350 lbs.

One point about Mr. Edge's letter I would like to call attention to. He declares that it is obvious that such steam cars as have been recently competing in the hill-climbing competitions are "simply instruments used for short-distance sprints." I now have the honour to suggest that, if it is worthy of his consideration, we plan a hill climb between Mr. Cecil Edge's 60-h.p. Napier that was run at Shelsley Walsh, South Harting and Aston Hill (as I assume the same car was run in the three hill-climbs), and my 18-h.p. White steam car which was run in competition with the Napier car in those three events. I should, of course, run identically the same car that I ran, and would expect Mr. Edge to do likewise. I would like to stipulate that Mr. Edge would use no oxygen or other adjunct to petrol. I would be willing to put up £100 toward a purse of £200, Mr. Edge to put up the other £100. I believe that if we start in Porlock village we could find sufficient gradient to call it a hill climb for at least two and a half to three miles.

I would like to point out that many of my friends in the Press have been wrong with regard to the breakage to my engine at the Henry Edmonds hill climb. I came to the starting line with a high pressure of steam and let it in more suddenly than I should have done, which resulted in shearing a retaining pin in the low-pressure web. This, of course, made my low-pressure and my high-pressure cranks work against each other. As the hill climb was on Saturday afternoon, and I was starting in the same car on Monday morning for a Continental tour, I towed the car to London as the easiest way to do the repair efficiently

and quickly, so that I could start early on the Monday morning. This I did, and to my certain knowledge I gave no information to any Press correspondent with reference to the breakage. I quite appreciate the efforts of several friends to explain what they termed a "burst generator," but, unfortunately for the correctness of their reports, the generator was not in the least damaged; in fact, I have not had any generator trouble with the car, in spite of the high pressures which have been maintained through the various competitions I have run in. I have had one or two troubles this year, but they have all been engine breakages, and have all been due to my efforts to start the car more suddenly than wisdom might dictate.

I have just returned from France, where my odometer tells me that since the Henry Edmunds hill climb I have travelled with this same car 1,118 miles, sometimes at very high speeds, and including such trying roads as the Auvergne Gordon Bennett course, carrying a full load, without one single involuntary road stop except for tyres. A member of the committee of the Midland Club was in the car and can vouch for my statements. To cap the climax, I ran the car this morning from Southampton to London with five up without stopping the road wheels, which certainly shows that the car was in good condition.—Yours truly,

FREDERIC COLEMAN.

### THE SALTBURN MEET.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As my name has been mentioned in connection with the "Sheffield Daily Telegraph" and Yorkshire Automobile Club, I feel I must reply personally to the letter in your issue of the 21st ult., and notes thereon.

Messrs. Bryant and May's Argyll Delivery Van, which took part in a Procession on the 14th ult., at Ilford, organised for the purpose of collecting funds for the local Hospital.

When the cup was presented to the Yorkshire Automobile Club, it was understood to be for cars up to 24-h.p., and terms of competition and handicapping were left to be settled by the Y.A.C., and a formula for petrol cars (supplied by Mr. Basil Joy, of the A.C.G.B.I.) was sent us by Mr. Leng, in which no mention of steam or electric cars was made. Therefore, my committee were entirely justified in assuming that a competition for petrol cars was alone intended.

When the terms of handicapping were completed they were sent to one proprietors of the "Sheffield Daily Telegraph," who approved of them, and they were embodied in a prospectus which was issued to the public in due course by the Y.A.C. After the issue of the prospectus in May, 1905, Mr. C. D. Leng, who had been away for his holidays whilst the correspondence with the "Telegraph" was taking place, wrote asking for steam to be admitted, which was then entirely out of the question, as the public announcements had been made, and having regard to the fact that his directors had agreed to the terms of competition.

Whatever may have been Mr. Leng's intentions with regard to the cup, my committee had only documentary evidence upon which to base the event. The cup having once been competed for, it would have been unfair to the holder to have altered the terms of competition this year or next; therefore, rather than submit to Mr. Leng's request for steam to be allowed to compete, the Y.A.C. Committee had no option but to return the cup to the donors and substitute another. The value of the "S.D.T." cup is given in your article as being 50 guineas, which is grossly overstated. I may say that when I visited Sheffield on June 26th I was very courteously received by Mr. Leng, who asked me, as chairman of the Y.A.C., to give him my personal undertaking that the cup should in 1907 be competed for by petrol, steam, and electric cars, but I pointed out to him how impossible it was that I should give this undertaking

and bind a future committee of the Y.A.C. He then gave verbal permission for the cup to be run for on the old terms.

It is interesting to note that on the evening of my interview with him he writes me:—"The 24-h.p. touring car is already out of date, and for future competitions of the 'Sheffield Daily Telegraph' trophy I should like to have your assurance that your committee will extend event D, that it will include touring cars up to say 40-h.p., divided into classes, the chassis price to be, say, £500, £600, £700, £800, the winner of each class to meet in the final upon handicap terms. I would suggest that the race or competition be extended to five miles. This, I think, would be possible on the sands by running to a point and back again. I shall be glad to have a letter from you, as chairman of the Yorkshire Club, and I have no doubt that such an event would be very interesting."

On the 28th June I received another letter, in which Mr. Leng seeks to further extend the event, as I will show by an extract as follows:—"On Saturday you called and pointed out that the programme was printed and matters had gone so far that you hoped we would allow the cup to be run for as before. I agreed to this rather than upset your arrangements, but what I now want is a promise from you, as chairman, that in 1907 the 'Sheffield Telegraph' trophy will be offered for an open event such as we contemplated. If you have a line on your programme intimating that in future this event will be open to all makes of touring cars up to chassis price of, say, £900, there will be no hardship on the winner. It is extremely unlikely that anyone will win the cup twice in succession."

The matter was carefully considered by my committee, who arrived at the conclusion that the only possible way to meet the difficulty was to return the cup.

We feel deeply sorry that such a misunderstanding between the proprietors of the "Sheffield Daily Telegraph" and ourselves should have arisen, and can only regret that the terms of competition were not made plain to us before the offer of the cup was entertained. So far as I am concerned this matter is at an end. To me personally it has been very painful.—Yours truly,

F. H. HEPPER.

### HOUNSLOW: A WARNING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—On Saturday, about 10.15 p.m., on passing through Hounslow, at the beginning of Bath Road, a large brick was hurled from the pavement at my car, which, besides the driver, contained three people. The brick fortunately missed the driver and struck the wind shield behind him, completely smashed the plate glass, and passed through, just missing a lady occupant. The car was immediately stopped, but no one was to be found, and it is needless to say there was no policeman within call. I am sending this letter as a warning to fellow-motorists of the treatment they are likely to receive in passing through this district.—Yours truly,

H. MUHLENKAMP.

### VALVE SPRINGS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be glad if you could give me some information as to how to judge whether the inlet and exhaust valve springs have been weakened, and also the best way of testing the same. My engine has latterly not been pulling so well as usual, and a motoring friend has suggested that it may be due to weak valve springs.—Yours truly,

W. HERBERT.

[There is really no definite method of testing the spring of the valves; the only way is to try slightly stronger springs and test the same. If no better results are obtained, we would advise the replacement of the old ones, as too strong a spring only causes unnecessary wear on the cams and tappets.]

### LOSS OF POWER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be glad of any advice in the following matter. The engine of my four-cylinder car, which was recently overhauled, such as having valves ground and bearings tightened, has, however, since being assembled, lost all power. The compression is less than it was before the valves were ground in.—Yours truly,

W. T. HUDSON.

[We would advise the taking out of the valves and carefully wiping the same and also the seating, as sometimes in grinding and cleaning round the valves a little of the carbon deposit drops below the inlet valve, and upon being subjected to the suction of the piston it gets under the valve, causing loss of compression. No doubt if the engine be run for a short time the compression will again be found good.]

TYRE STOPPING MATERIAL.—An Irish motorist writes:—"Would some of your readers who repair cuts in their tyres give their experience of the various tyre stopping materials now on the market? I have tried several makes without great success."

NUMBER PLATE FOUND.—Mr. L. Marcus, 124, Shaftesbury Avenue, W., found a trade number plate near Slough on Saturday afternoon.

# The Report of the Royal Commission.

ELSEWHERE we refer to the legislation with regard to motor vehicles which preceded the appointment of the Royal Commission on Motor Cars whose report has just been issued. Having premised that the scope of the new Bill that will be introduced into Parliament should include traction engines, the subject is divided into ten divisions which are summarised below.

## SPEED AND DRIVING.

The present general speed limit of twenty miles an hour for light motor-cars should be abolished, speed being controlled by Section 1 of the Motor Car Act, 1903, which made it an offence to drive on a public highway negligently, recklessly, or at a speed or in a manner dangerous to the public.

In towns and villages and at dangerous corners, steep hills, and similar places where caution is required speed should be controlled by a twelve-mile speed limit where adopted by resolution of the local authorities. The existing power of the Local Government Board with regard to the prohibition of motor-car traffic is to be retained, as well as the present pattern of notice boards.

The twelve-mile limits should be indicated in small towns and rural districts by danger-boards and in London and large towns by notices in the "Gazette" and other advertisement.

The speed limit of heavy motor-cars weighing from two to three tons and having non-resilient tyres should be reduced to five miles an hour.

The duty of a motorist as to stopping when any damage or accident has occurred should be enlarged much on the lines suggested by Earl Russell, making it an offence for anyone thus involved who drives on without tendering his name and address.

The Commission does not recommend the compulsory provision of speedometers on cars.

## ROADS AND DUST.

Agreeing that the dust nuisance is prevalent, the Commission recognised that it was due to the action of pneumatic tyres on the road. Evidence had not shown that any particular form of construction will produce cars that will uniformly raise but little dust. Hence they fell back upon the necessity for improved road construction, and propose that the revenue derived from the taxation of motor-cars should be devoted to the improvement of roads. A central department should direct the allocation of the moneys raised by such taxation to the different local authorities and some additional powers and facilities should be given to local authorities for obtaining the removal of obstructions to the public view on rural highways in certain cases. Local authorities should also provide side paths as far as possible.

## HEAVY MOTOR CARS.

The Commissioners are of opinion that the total loaded axle weight of a trailer should not exceed four tons, that, at any rate as regards future construction, all iron or other rigid tyres of heavy motor-cars should have rounded edges (as permissibly provided in Article VI. of the Heavy Motor Car Order, 1904), that no heavy motor-car should exceed a maximum over-all length of 22 feet, and that all motor vehicles having an axle weight of eight tons should have a wheel base of not less than eight feet. Further, the provisions of the Locomotives Act, 1898, in regard to the closing of bridges to locomotives should be applied to heavy motor-cars.

## MOTOR CYCLES.

The Act of 1903 refers to motor-cycles, but contains no definition of the term. The Local Government Board in their circular of 20th November, 1903, suggested that a motor-cycle might be generally treated as meaning a motor-car designed to travel on not more than three wheels and weighing not more than 3 cwt. unladen. A definition to this effect should be embodied in any new Motor Car Act.

## REGISTRATION OF CARS.

Annual registration of motor-cars, with a yearly fee of five shillings for cars and one shilling for moto-cycles, should be enforced. A registration card should be always carried on the car.

Identification plates of a slightly larger size than those at present used should be supplied by the local authority only, and should bear their mark, and cars should only be registered by the authorities of the county or county borough where the owner has a permanent postal address.

The registering authority should have the power of weighing any car. The definition of the weight of a car laden or unladen should be amended.

Further facilities should be arranged for enabling members of the general public to ascertain the name and address of the owner of any motor-car.

## LICENSING OF DRIVERS.

Owners of motor-cars should be liable to penalty if on summary conviction they are shown to have abetted their drivers in committing certain offences connected with the driving of a motor-car, and the duties of owners as to giving information leading to the identification of their drivers should be enlarged.

The procedure with regard to the issue, renewal, inspection, and production of driving licences should be simplified and slightly amended.

While the institution of an official system of the examination of motor-car drivers is not recommended, favourable reference is made to voluntary examinations for the A.C.G.B.I., the passing of which is now required by the metropolitan police authorities for police constables acting as motor-car drivers.

## IDENTIFICATION.

More specific regulations should be made as to the position and illumination of identification marks.

The adoption of the recommendation with regard to the size and location of the identification plates will render it no longer permissible to have the marks painted on a car. All plates should have the letters of the registration authority in a separate line from those of the registered number—Thus:—

L.C.

000 instead of L.C. 000.

The new dimensions proposed are:—

	Motor-Cars.		Motor-Cycles.	
	New Dimen-sions.	Old Dimen-sions.	New Dimen-sions.	Old Dimen-sions.
	Inches.	Inches.	Inches.	Inches.
Height of letter and figures ... ..	4	3½	2½	1½
Breadth of stroke... ..	½	½	1½	1½
Width of letters or figures (except I.) ... ..	2½	2½	1½	1½
Space between adjoining letters or figures ... ..	½	½	½	½
Space between any letter or figure and the edge of the plate ... ..	1	½	½	½

The law as to manufacturers' marks should be simplified with a view of securing greater freedom for the motor-car industry. It is suggested that makers should keep a more careful record than they have hitherto done, and that there is no necessity to restrict too closely the use of such marks in the case of cars used in the course of trade. The marks should be larger than those now in use, and it is recommended that the fee of £3 a year paid at present for the right to use these plates should be altered to one of 5s. for every pair of special plates in the manufacturer's possession. The plates issued by an authority should only be used on cars issuing from establishments in the area of that authority, and not at branch establishments elsewhere.

## OFFENCES AND PENALTIES.

A special penalty should be imposed for being drunk when in charge of a motor-car.

The endorsement of licences should be at the discretion of the Court except for the more serious offences. The holder of an endorsed licence should be entitled to obtain a clean licence after two years, during which he has held a licence without further endorsement.

A right of appeal should lie when endorsement or a fine of over 20s. has been imposed.

When an owner or hirer or any one present in a motor-car can be shown to have knowingly abetted any offence committed by the driver under Section 1 of the Motor Car Act, 1903 (as it now stands or as it may be amended), he should be liable on conviction to be punished by fine or imprisonment as at present, to withdrawal of his licence if he hold one, and to suspension of his registration card if he is a motor-car owner.

## SPECIAL QUESTIONS.

The emission of smoke or visible vapour on a public highway in such a quantity as to cause annoyance or danger, and the causing of excessive noise or vibration not of a momentary description, should be an offence.

Two lamps should be carried on the right and left front respectively of all motor-cars other than motor-cycles. The Commission are opposed to the suggestion that all horse drawn traffic should carry tail lights, and point out that the only reason such is required on motor-cars is for the illumination of the number plates.

## TAXATION.

The taxes upon motor-cars should be increased, and should be raised by means of a consolidated scale of duties.

Trade motor-cars should pay one half the taxes charged on pleasure motor-cars.

The Commission were not persuaded by the proposals to alter the basis of taxation from weight to a combination of weight with horse power or cylinder capacity. The revised scale recommended is as follows:—

Motor-cycles to pay £1 a year.

Motor-cars, weight unladen not exceeding 12 cwt., to pay £2 2s. a year.

Motor-cars, weight unladen exceeding 12 cwt., but not exceeding 15 cwt., to pay £3 3s. a year.

Motor-cars, weight unladen exceeding 15 cwt., but not exceeding 25 cwt., to pay £5 6s. a year.

Motor-cars, weight unladen exceeding 25 cwt., to pay £8 8s. a year.

The report of which the foregoing is a synopsis is signed by Viscount Selby, the Marquis of Winchester, Sir D. Harrel, Sir W. B. Forwood, Sir E. R. Henry, Mr. W. J. Mure, and Mr. H. C. Monro, who join in expressing appreciation of the services of Captain Clive Bigham as secretary. To the report a reservation is made by Sir E. R. Henry and Mr. H. C. Monro, not so much that the law has failed as that in different counties the executive have not made equal use of it, and that in places the methods adopted for enforcing Section 9 have not been well devised. "Whether the general speed limit is made much or little use of, the interests of the general public appear to us to demand that it shall continue to be part of the law, so that it may be applicable when required, and we must rely upon public opinion and magisterial benches everywhere to see that it is enforced only under reasonable conditions."

To the Report are appended many valuable reports on the law and practice as to motor-cars in the principal foreign countries and on the administration, construction and maintenance of certain classes of roads on the Continent.

An 18-24-h.p. Peugeot Car, with special Touring Body.

## OPINIONS OF MOTORISTS.

Several well-known motorists have favoured us with their views on the Report, the consensus of opinion being remarkably favourable to the finding of the Commissioners. In this connection the views of the officials of provincial clubs are of particular interest, and we have pleasure in giving publicity to the following communications to the M.C.J.

## YORKSHIRE VIEWS.

Mr. Sidney S. Dixon, the hon. secretary of the Bradford Automobile Club, the local branch of the Yorkshire Automobile Club, writes:—The Report of the Royal Commission on Motor Cars is more favourable to motorists than I had anticipated it would be.

I rather take exception to their recommendation that heavy motor-cars weighing from two to three tons, and having non-resilient tyres, should be reduced to five miles an hour. In my own particular district there are over twenty of these vehicles now working, and it would be a very serious matter to the owners were their speed to be restricted to this limit. Of course we are all aware the police up to the present have left this type of vehicle alone, and have devoted all their attention to pleasure cars, but in the event of the Act being passed abolishing the speed limit, it seems to me very probable they would confine their attention to heavier vehicles, in which case the motor-wagons and buses would very seriously suffer.

That the revenue derived from the taxation of motor-cars should be devoted to the improvement of roads I am entirely in accordance with. I also approve that a central department should direct the allocation of such monies raised, with the proviso that the local authorities who have the spending of such a sum of money should utilise it in improving the roads which are used by motorists, and not on small bye-roads which are found in every city and which are usually found at any time of the year in course of repair.

With reference to the emission of smoke or visible vapour on a

public highway in such a quantity as to cause annoyance or danger, and the causing of excessive noise or vibration not of a momentary description, should be an offence, I think this should not apply to the trade, as we are all well aware that it is more or less essential that a new car should have more lubrication than one which has been running for some time; I have also noticed repeatedly on cars of certain makes that when they are making a start, especially if they are on a slight incline, there is bound to be some emission of smoke through burnt oil; this is not noticed on level roads, but on a very steep hill it is practically impossible to run without emitting some smoke. I do not approve of the increase of taxation upon motor-cars; on comparing them with other vehicles I think that they pay more than their ratio of taxes already. That the general speed limit of twenty miles an hour for light motor-cars be abolished is what we have been fighting for for some time, and I entirely approve of the suggestion that a twelve miles speed limit be adopted by local authorities where it is thought expedient in towns, villages, or at dangerous corners, but I think it ought also to be essential that where such a limit is enforced conspicuous notices should be posted on all roads converging towards such an area, as one can hardly be expected to refer to a gazette before passing through towns and villages whilst on tour.

Mr. Charles P. Wilson, hon. sec. of the Yorkshire Automobile Club, entirely approves of the report of the Royal Commission, especially the recommendation to abolish the speed limit, and he also thinks the proposed graduated tax on motor-cars for the road improvements is a step in the right direction.

## LANCASHIRE OPINION.

Mr. Arthur Birtwistle, hon. sec. of the North East Lancashire Automobile Club, writes:—I approve, on the whole, of the report of the Royal Commission. The suggested universal lighting must commend itself to all who legitimately use the roads after dark, whilst the recommendations to abolish the speed limit and the dire penalties for the accidental omission to carry one's licence and the extension of the rights of appeal must also commend themselves to all motorists.

The provision for the graduation of the tax on motor-cars is, I think, a move in the right direction, for the following reasons. In the first place, the suction from the pneumatic tyres of a heavy car must be much more than that from a light one; a heavy car, as a rule, also raises much more dust than a light one; in both ways the heavier car is, in my view, causing a larger deterioration of the road. In the second place, the larger cars are essentially pleasure cars, i.e., luxuries, and, speaking generally, the owners of such cars are in a position to pay an increased tax without feeling it, and I am of opinion that, so far from raising objections, such owners will favourably regard the proposal if the revenue thus derived is spent, not in any one particular district, but throughout the country generally.

Mr. Charles Smith, hon. secretary of the North London Automobile Club, entirely approves of the report of the Royal Commission, and thinks that it is the beginning of common sense as applied to motoring.

## ROAD REPORTS.

WARWICKSHIRE.—A motorist writes cautioning drivers against the road between Solihull and Hampton-in-Arden. At the bottom of the hill leading to Solihull he has noticed some new cut stones put into the wheel ruts. The stones were all over the road in patches of from 50 to 100 yards. This goes on until within 60 yards of the canal bridge in the Catherine-de-Barns Road, or for a distance of from one to one and a half miles of loose stones. The net result of his experience was two tyres cut to pieces and rendered useless, and the other two cut so badly as to be useless until repaired.

LANCASHIRE.—Mr. W. H. Schofield, the Lancashire County Surveyor, has been experimenting with regard to the cost of dealing with the dust nuisance on main and secondary roads. Summarising the information, the use of palliatives would entail an additional expenditure of approximately £40 per mile, and there are 472 miles of macadamised main roads. Arrangements have been made through Messrs. Needham and Co., of Manchester, for the laying of a quarter-mile length of tar macadam on the Blackburn and Manchester road in the Turton Urban District, with a view to testing its wearing qualities under that class of traffic. The grouting of granite macadam with a mixture of boiling pitch and sand has been tried successfully on the main roads in Turton.

FARNHAM.—In Farnham, Surrey, the urban council have carried out extensive experiments with tar dressing, which have proved very satisfactory, and at the rural council have been considering a suggestion that the whole of the roads in their district—180 miles—should be treated with a dust preventive, and it was pointed out that this would involve the council in an expenditure of £11,000. It was eventually decided to send a circular letter to all the councils in the county of Surrey asking if they would be willing to join in a conference, or would give expression to their opinions as to the best remedies to adopt to abate the dust.

WEST SUSSEX.—A new main roads scheme is now under discussion by the West Sussex County Council. The Roads and Bridges Committee of that authority has erected motor caution boards near three schools at Horsham, and has sanctioned some experiments by the County Surveyor on the main Brighton road between Henfield and Woodmancote. The Lower Shoreham Road, Kingston-by-Sea, is also to be tarred, the cost to be divided between the local authority and the County Council.

## CLUBS AND ASSOCIATIONS.

### SCOTTISH.

A MEETING of the General Council was held on the 23rd ult., Mr. H. M. Napier, chairman, presiding, when the admission of seventy-five members to the Club was duly confirmed.

The prosecution of motorists was considered, and, having regard to the generally accepted view, confirmed by legal opinion, that, in terms of the Motor Car Act, the Sheriff Court is the only court of competent jurisdiction in Scotland, it was agreed that the Club should test the matter by the appeal of a suitable case to the High Court of Justiciary.

Application for official appointment of hotels and repairers in Scotland, the responsibility for which, under the agreement with the A.C.G.B.I., now devolves upon the Scottish Club, were submitted and a special committee appointed to deal with the matter. The relations between the Scottish Club and the A.C.G.B.I. were considered, the agreement came to being referred to in our "Comments" on another page.

The agreements with the Automobile Club of Great Britain and Ireland and the Motor Union, as negotiated and adjusted by a sub-committee, copies of which were in the hands of the members of the Council, were submitted and approved.

We may add that the financial clauses in connection therewith provide for an annual grant to the Motor Union equal to 5s. per member on the roll of the Scottish Automobile Club, and in consideration of the work done by the Scottish Club as the administrative part of the Motor Union in Scotland, including legal defence, if any, the representation of motorists at inquiries under the Motor-Car Act, &c., the Motor Union are to pay to the Scottish Club a sum not less than 55 per cent. of the total capitation grants paid by the Scottish Automobile Club in each year.

Having regard to the wider powers and responsibilities devolving on the Club under the agreements above referred to, the General Council had under consideration the whole constitution of the club. They agreed that its usefulness and efficiency and influence would be increased and its claims on automobilists—more especially those in outlying parts of the country—strengthened, and its membership still more largely augmented, were its sectional character abolished, and its administrative work entirely conducted through one governing body and one secretarial department. They consequently have framed an amended constitution and rules which will be submitted for approval of a special general meeting of the Club to be held shortly.

### AUTO CYCLE.

THE Auto Cycle Club will have a hill-climb on the 8th prox. at Birdlip Hill. The machines entered must be of the maker's standard pattern, fully equipped for the road, fitted with motor-cycle tyres, steel mudguards, toolbag weighing not less than 7 lbs., stand, and touring saddle. The tank must contain at least one gallon of petrol. There will be six classes, as follows:—

- 1.—For machines with engines not exceeding 80 by 80 mm. Variable gears allowed.
- 2.—For machines with engines not exceeding 85 by 85 mm. Variable gears not allowed.
- 3.—For machines with twin-cylinder engines; size of each cylinder not to exceed 80 by 80 mm., or its equivalent.
- 4.—For machines with twin-cylinder engines of any size.
- 5.—Slow test. Variable gears eligible.
- 6.—For forecars, sidecars, and quadcars, carrying two passengers; machines to be fitted with variable gear. Size of each cylinder not to exceed 95 by 95 mm., or its equivalent volume swept out.

### LADIES'.

LAST year the members of the Ladies' Automobile Club spent an afternoon at Bear Wood, Wokingham, and again this year Mrs. Walter invited them to have their final summer meet at her home. About fifty of the members and their friends were made welcome at Bear Wood by Mr. and Mrs. Walter. Among those who accepted Mrs. Walter's invitation were:—Baron and Baroness Campbell von Laurentz, Mrs. Louis Fagan, Mrs. Campbell Farrer, Mrs. H. R. C. Harrison, Mrs. Hartung and Mr. Hartung, jun., Mr. and Mrs. Buttemer, Mrs. Bonham Carter, Miss Evans, Mrs. Herbert Lloyd, Mr. Peter Lloyd, Miss Edith Schiff, Major and Mrs. Turner, Mrs. Bovill, Mrs. Hargreaves, Mrs. Whitaker, Mrs. Mansell-Moullin, and the club secretary, Miss d'Esterre-Hughes.

### IRISH AUTOMOBILE CLUB.

It has been deemed advisable to hold the Motor-car Gymkhana on August 28th at St. Andrews College Recreation Grounds, Donnybrook, instead of Leopardstown Racecourse. These grounds are situate about 300 yards, on the left-hand side of the road, beyond the terminus of the Donnybrook tram, and within easy walking distance of the Royal Dublin Society's Show Grounds. The Lord Lieutenant has promised to be pre-

sent. A novel and interesting programme of events has been prepared.

### ESSEX.

THE programme of the Essex County Automobile Club for the rest of the year includes meals at Frinton and Colchester, an open hill climb on October 6th, and a non-stop run to Witham on September 15th. The annual dinner will be held on November 14th.

### KENT.

ON Saturday last the members of the Kent Automobile Club were most hospitably entertained by Mr. and Miss Willis at their residence, "The Phillipines," Brasted Chart. "The Phillipines" is situated on one of the highest points in Kent, and the views from the terrace are very beautiful. Some twenty cars were lined up on the wide terrace in front of the spacious lawns, on which the Blue Hungarian Band played throughout the afternoon. Mr. Willis had kindly left open for the inspection of his guests his laboratory, which is full of interesting things for those who were scientifically inclined. About eighty members and friends were present, among whom were Col. Edward Latter, Mrs. Lubbock, Mr. and Mrs. Austin, Dr. Madden, Mr. and Mrs. Gardner, Mr. and Mrs. Mann, Mr. Brewer, Mr. and Mrs. Symmonds, Mr. and Mrs. Killik, Mr. C. B. Gardner, Mr. A. M. Killik, Mr. and Mrs. Nash, Mr. and Mrs. Wyllie, Mr. Page, Mr. Stace, Mrs. Kenyon and the hon. secretary.

### NORTH EAST LANCASHIRE.

THE motor-car trials of the North East Lancashire Automobile Club last week took place on a kilometre length of the new road that leads from the Grammar School to the Bungalow, and the Pike at Rivington

A Motor-Car Picnic.

was marked out, and spectators lined the route as well as the moorland slopes. The fastest times in each class were as follows:—

- For cars listed at not more than £200.—Dr. J. V. Fox, 6-h.p. Belsize, 3 min. 36 2-5 sec.  
Not exceeding £300.—F. Pearce, 15-h.p. Vulcan, 3 min. 9 1-5 sec.  
Two-seated car, not exceeding £300.—E. A. Riley, 12-h.p. Belsize, 2 min. 30 1-5 sec.  
Not exceeding £500.—H. Noble, 18-24-h.p. Belsize, 2 min. 14 sec.  
Not exceeding £600.—A. H. Walker, 20-h.p. Darracq, 1 min. 36 3-5 sec.  
Not exceeding £700.—A. H. Walker, 30-h.p. Darracq, 1 min. 24 3-5 sec.  
Not exceeding £800.—W. D. Coddington, 30-40-h.p. Daimler, 1 min. 19 1-5 sec.  
Not exceeding £900.—G. Chapman, 30-40-h.p. Daimler, 1 min. 21 sec.  
Not exceeding £1,000.—J. E. Baxter, 40-50-h.p. Wolseley, 1 min. 12 sec.  
Over £1,000.—A. Birtwistle, 35-45-h.p. Daimler, 1 min. 7 3-5 sec.

### MANCHESTER.

ON Saturday last the Manchester Automobile Club had a run to Beeston Castle, situated half-way between Chester and Crewe. The castle dates from the early part of the reign of King Henry III., and is now a stately ruin. Some of the walls and several of the towers still remain nearly perfect. Beeston Hill, upon which the castle is built, is 530 feet high, and the view obtained from the summit over the Vale Royal of England amply repaid those members of the club who had taken the trouble to climb to the summit. The draw well was an object of interest as it was in perfect condition though dry. Up to 1842 it was nearly full of rubbish, and it had the reputation of being a hiding-place for hidden treasure, and in that year it was cleaned out, and found to be 366 feet deep, but nothing of value was obtained by

emptying it. Though several severe showers rather spoilt the enjoyment of those who were picnicing in the grounds, the run was pronounced a success and will no doubt be repeated another year.

### MIDLAND.

ONE hundred and twenty-five of the most enthusiastic automobilists that ever rode in cars sped through the lanes of Warwickshire on Saturday.

Owing to the kindness of Mr. Clayton, J.P., of Castle Bromwich, and the members of the Midland Automobile Club, these little cripples were given a joyous day. In the garden there was a sumptuous tea, which they ate to the accompaniment of a gramophone, and afterwards Mr. Punch ill-treated his acquaintances in the old and irresistibly amusing way.

### LINCOLNSHIRE.

As previously announced, there will be a hill climbing competition, by permission of Sir John Thorold, in his picturesque park at Syston, on Saturday, August 18th, open to members of the Lincolnshire Club only, under the closed competition rules of the A.C.G.B.I.

Mr. J. St. F. FAIR, of Chertsey, and Mr. J. Milner, of Broadclyst, Devon, have been elected life members of the Motor Union.

### JOINT CLUB MEET.

ONE of the largest musters of motorists, at least in that district, was held on Thursday last week at Bulwell Hall, near Nottingham, the charming residence of Mr. Charles Hardy, the president of the Nottingham Automobile Club. Mr. Hardy's own club and the Derby, Leicester, and Lincolnshire Clubs had been invited, and there were over a hundred cars, with about 350 passengers. After the reception the beautiful grounds were inspected, and then tea was served in a special marquee, the band of the Robin Hood Rifles playing choice selections. The visitors then drove through the park to a large field, where Mr. Frank Butler's balloon, "Dolce far Niente," was inflated. No less than 45,000 feet of gas had been used, and she was a pretty sight as she "rode at anchor," so to speak, being perfectly still. Mr. Butler had with him the Hon. C. S. Rolls and Mr. C. F. Pollock. Surrounded by a great crowd of motorists, and witnessed by thousands of people from the district, the balloon made a splendid ascent about 5.30, and went off towards Matlock and the Peak district. Soon after seven o'clock the party safely alighted on the moors about five miles from Buxton, and at a height of some 1,600 feet above sea level. The voyage was a most successful one, and the aeronauts had some glorious views of beautiful Derbyshire.

Amongst the members of visiting clubs who accepted invitations were Messrs. G. W. Reynolds, Leicester (16-h.p. Peugeot); F. H. Goddard, Lincoln; C. J. Allin, Derby (10 12-h.p. Humber); Dr. Hancock Steil, Grantham; Orson Wright, Leicester (22-h.p. Minerva); A. McAlpin, Leicester; W. B. Jevons, Market Rasen; Dr. Gilpin, Bourne; Mr. W. T. Gent, Gainsborough; H. E. Barron, Leicester (10-h.p. Peugeot); H. E. Harding, Leicester (8-h.p. Parr); Dr. Jagger, Lincoln; T. Mays, Bourne; W. A. Tomlinson, Bourne-mouth; R. W. Sale, Derby (8-h.p. Wolseley); G. H. Reading, Burton-on-Trent (10-h.p. Wolseley); Dr. W. G. Copestake, Derby; Captain Newsum, Lincoln; Captain Byron, Leicester; Dr. Sharp, Newark; and R. B. Gibson, Bourne (12-h.p. Richard-Brasier).

The members of the Notts Automobile Club who accepted the invitation of their president included Messrs. Jesse Boot, 16-h.p. Richard-Brasier; Dr. Gray, 10-12-h.p. Humber; P. L. Huskinson, 30-h.p. Daimler; A. R. Atkey, 16-h.p. Minerva; C. E. W. Lucas; A. Barlow, 16-h.p. Argyll; B. W. Winter, 20-30-h.p. Renault; J. W. Carson, 10-12-h.p. Humber; S. C. Hardy; Dr. P. Tressider; F. A. Boulton, 35-h.p. Daimler; A. F. Houfton, 16-20-h.p. Humber; J. D. Siddeley; R. C. Craven; Ross Browne, 18-28-h.p. Mercedes; R. M. Wright, 10-12-h.p. Humber; W. E. Danby, 10-h.p. Argyll; E. W. Wells, 30-h.p. Daimler; W. D. Wells; W. T. Cresswell, 16-20-h.p. Argyll; R. Cripps, 16-h.p. Argyll; W. M. Hutchinson, 30-h.p. Daimler; Booth Granger, 10-h.p. Gladiator; R. S. Clifford, jnn., 12-h.p. Richard-Brasier; Colonel R. L. Birkin, 16-h.p. Clement; H. Belcher, 12-16-h.p. Talbot.

### MOTOR SCHOOL EQUIPMENT.

THE following is a provisional list of equipment necessary for a driving school in order to obtain the A.C.G.B.I.'s Club's licence:—

- (1) A car that can be driven. (Not less than 10-12-h.p. two-cylinders).
- (2) A complete engine that can be run, mounted on a table or stand, so that it can be taken down and re-assembled without difficulty.
- (3) A set of change-speed gears.
- (4) A set of differential gears.
- (5) A separate float-feed carburettor.
- (6) A complete system of high-tension ignition, adapted for a two or four-cylinder car, consisting of accumulator, commutator, coils and plugs, and, if possible, model crank-shaft and pistons.
- (7) A magneto (high or low-tension).
- (8) Diagrams of wiring for accumulator, and for high-tension and low-tension magneto.
- (9) A centrifugal and gear pump.
- (10) Wall diagram of water circulation.
- (11) Some covers and tubes and a rim or, prefer-

ably, a wheel on a stand. (12) A set of diagrams illustrating the various systems of lubrication. (13) A charging board or diagram if there is no electric supply. (14) Examples of spring washers, and of the various ways of locking nuts. (15) Examples of Stauffer greasers. (16) Text-books as approved by the Club.

### HILL CLIMBING CONTEST.

#### HAZLEWOOD HILL.

ON Saturday last the hill-climbing competition for possession of the Derby and District Automobile Club Challenge Cup took place at the site again chosen being Hazlewood Hill. The competition was confined to the members of the club. The cars assembled at Hazlewood Railway Station, where they were weighed with their occupants and lined up at the foot of the hill, which is close to the station. The course is a very stiff incline and constitutes an admirable test of the hill-climbing capabilities of a car.

The results are to be forwarded to the A.C.G.B.I., who will, taking into consideration the horse-power of each car, the weight with passengers and other detail, award the cup to the driver who, in their opinion, made the most meritorious ascent, thus giving the smaller cars an equal chance with the larger ones. The Derby Club were also again giving a silver medal to the winner of the challenge cup, and a bronze medal for the second best performance. About 2.30 a start was made and some excellent ascents were seen.

Appended is a list of the competitors, their cars, and the times made in their best attempt:—

		Time. Min. sec. longer.
F. A. Bolton	35-h.p. Daimler...	x
A. Swinger	30-40-h.p. Daimler	38
C. T. Leech	18-22-h.p. Daimler	45 2-5
A. J. Clay	20-h.p. Ryknield	1 3-5
L. P. M-II	15-h.p. Darracq...	1 19
H. A. Johnson	22-28-h.p. Crossley	1 31 1-5
F. Hurdle	8-10-h.p. Humber	1 32 4-5
S. Downing	10-h.p. Alldays	1 37
H. Jefferson	8-10-h.p. Humber	2 35 2-5
G. F. Reading	10-h.p. Wolseley	2 40 4-5
C. J. Allin	8-10-h.p. Humber	2 45 3-5
N. Sayer	10-h.p. Wolseley	2 47 3-5
J. Richards	10-h.p. Wolseley	3 12 4-5
H. G. W. Dawson	7-8-h.p. Swift	4 15

The course was admirably kept by the county police assisted by the club officials, who were as follows:—Starter, Mr. P. E. Jeule; time-keeper, Mr. J. Allin; clerks of the course, Messrs. L. P. Mell, Dr. Copestake, C. T. Leech. As usual, the arrangements for expeditiously dispatching the cars and keeping the hill clear were greatly facilitated by use of the club's telephone. Amongst those present, in addition to competitors and their passengers, were Mr. Geo. B. Crompton, Miss Crompton and party, Rev. W. H. Turner, Mrs. Turner, Mr. and Mrs. G. B. Fletcher and party, Mrs. C. J. Allin, Miss Allin, Mrs. L. P. Mall, R. Jefferson, Miss Carnit, J. T. C. Eadie and Mrs. Eadie, W. Hartley, A. Ford, H. A. Johnson and others.

### NEW COMPANIES REGISTERED.

ACADEMY OF MOTORING.—Capital £10,000. Teachers of motoring. Agreement with Messrs. P. B. Adams, H. B. Pettitt, L. C. Bartholomew, and W. P. Adams. 85, New Bond Street, W.

ROSSE MOTOR-CAR AND CYCLE COMPANY.—Capital £5,000. Agreement with Messrs. T. Rhodes, E. Heaton, and P. Cox.

H. J. NICOLL AND CO.—Capital, £125,000. To acquire the business carried on by Messrs. H. Nicoll, D. Nicoll, and J. Nicoll, at 114, 116, 118, and 120, Regent Street, W., and elsewhere, and H. J. Nicoll and Co., and to carry on the business of motorists' tailors, &c.

BRITISH MOTOR-BOAT CLUB PROPRIETARY, LIVERPOOL BRANCH.—Liability, 2s. 6d. Signatories are to appoint the first committee.

MOORE, OF BRIGHTON.—£2,000. To acquire the business carried on at 21, Regency Square, and 1 and 2, Regency Mews, Brighton, as Henry Moore, and to carry on the business of motor-car, omnibus, and carriage manufacturers, &c. The first directors are Mr. Henry Moore (chairman and managing director) and Mr. Hugh S. Moore. Union Bank Chambers, North Street, Brighton.

LONDON AUTOMOBILE AGENCY.—Capital, £500. First directors Messrs. F. W. Bishop, G. F. Skudder, and N. P. Burch.

RESILIENT RIM COMPANY.—Capital, £10,000. To adopt agreements with B. B. Van Praagh and (2) with Mr. M. Braithwaite, and to carry on the business of coach and carriage builders, &c. 4, Suffolk Street, Pall Mall East, S.W.

BRITISH TAXI-MOTOR CAB COMPANY.—Capital, £150,000. To adopt an agreement with Mr. G. Garnier, and to carry on the business of motor-car proprietors, &c., Botolph Lane, E.C.

DE DION.—Capital, £100. To carry on, in the United Kingdom, France, or elsewhere, the business of manufacturers of and dealers in

motor-cars, cycles, and vehicles propelled by any kind of motive power, whether manufactured by De Dion, Routon et Cie or others.  
MOTOR CARRIERS.—Capital, £1,000.

### PUBLIC MOTOR SERVICES.

MESSRS. FAIRBANKS BROS., of Paddington, cab proprietors, sued the London Road-Car Company at Marylebone County Court for damages in respect of two accidents in which defendants' motor-buses had figured. Mr. Turrell (instructed by Mr. Nonweiler) was for the plaintiffs, and Mr. R. Drake for the defendants. Plaintiffs' counsel said that until recently his clients had had a curious agreement with the defendants, known as a "knock for knock" agreement, which provided that neither company was to bring an action against the other for injury to horses or vehicles—in other words, the parties were to have "knock for knock." Plaintiff said that the agreement had never paid with horse vehicles, and it would therefore be easy for the Court to understand that it would mean a dead loss when applied to motor-buses. After hearing the evidence, the jury found for the full amount of claim in regard to the first accident, but for the Road-Car Company in the second

Bryan, A.I.C.E.; at the Dollis Hill Garage, Cricklewood, where Mr J. H. Fooks-Bale is in charge, practical lessons in driving are given.

SOME weeks ago the motor-bus company at Southend were fined for plying for hire within the borough without a licence, and the vehicles have not been running since. At a special meeting of the town council this week, a recommendation to grant a licence under amended conditions to March 31st next is being considered. The previous licence was refused by the company on the ground that the terms were arbitrary and unreasonable.

A SERVICE of motor-omnibuses has commenced running this week between Clapham Junction and the Angel, Islington. The route is via Oakley Street, King's Road, Sloane Street, Piccadilly, &c.

REPLYING to questions by Mr. J. G. Weir in the House of Commons on Tuesday, the President of the Local Government Board said, so far as licences under the Motor Car Act to drivers of motor-cars are concerned, there is no power to require any test of eyesight before they are granted. So far, however, as relates to licences under the Metropolitan Public Carriage Act to the drivers of omnibuses and hackney carriages in the Metropolitan police district, the police authorities satisfy themselves as to the general soundness of the driver's sight before a licence is given.

Touring in the Dauphine District of France. The Palace of Justice, Grenoble.

case, where the defence raised was that plaintiff's cab-driver had unsuccessfully tried to cut in front of the motor-bus.

ON Monday morning some consternation was caused in Ludgate Hill, E.C., by the presence of a motor-bus upon the pavement, more especially as it had forced a horse and van thereon in its progress towards a shop window.

A SLIGHT accident occurred on Saturday to a party from Portsmouth, who were enjoying an outing on two motor-buses. While descending Butser Hill, three miles from Petersfield, the first bus met a heavy cart, which was passed safely. The flags flying behind, however, frightened the horse, which swerved into the road; and the second bus, to avoid collision, ran too close to the bank and into a telephone pole. The latter was broken, but the bus was stopped, and thus prevented from falling over the side of the road. Only slight damage was done, and after this was repaired the party proceeded to Petersfield.

ALL motor-bus drivers employed by the London General Omnibus Company receive about three months' practical training before being allowed in the streets with a vehicle in public service. At the depot in Torrens Street, Islington, instruction in theory is given by Mr. F.

### MOTOR-CAR ACCIDENTS.

ON the Great Bath Road, near Slough, a woman, endeavouring to cross the road in front of a motor-car, driven by Mr. J. Howard McFadden, jun., of Philadelphia, was caught by the vehicle and sustained such fearful injuries that her life is despaired of. On the previous evening, in Slough High Street, a little girl, named Moorshead, of Slough, was knocked down by a car driven by Mr. Frank Ballencont, of San Francisco, and owned by Mr. Carolan, who is also an American. She now lies in the infirmary in a very dangerous condition.

A BOY named Harry Timmis was knocked down by a motor-car at Broadheath, near Manchester. He was caught by the splash-board of the car and, suffering from a fractured skull and concussion of the brain, was taken to the Altrincham Hospital.

EARLY on Saturday morning two motor-cars were running along the Chorley Road, Westhoughton, near Bolton, when they came into collision, and both were overturned. Two of the occupants, Mr. James Randles and Mr. Robert Percy, of Nottingham, received serious cuts and bruises, but the others escaped with a shaking. The cars were but slightly damaged.

ON Monday last an alarming accident befell a party of motorists at Adams Hill, on the outskirts of Nottingham. Mr. H. Bircumshaw, Beeston, and his wife were being driven home by their chauffeur, John Allcock, accompanied by Mr. and Mrs. Hardstaff, when the car came into collision with a pony and trap. The latter was smashed, and its driver was thrown to the ground, alighting on his head. The car was overturned upon its occupants and greatly injured.

EARLY on Monday morning an accident, attended with fatal consequences, befell two well-known Dumfries gentlemen whilst out with a motor-cycle equipped with a basket seat in front. All went well till they were near Crocketford, ten miles from Dumfries, on their return journey. It was early morning and moonlight, and after rounding a corner of the road they suddenly dashed into a drove of cattle that was being taken to Castle Douglas market. Both gentlemen were thrown violently to the ground, and the machine was much damaged as the result of the collision with the alarmed animals. Mr. Barbour was thrown on his head, and died in a few minutes, without regaining consciousness, his skull being fractured. Mr. Blake received serious injuries about the head and face, but under medical attendance is progressing favourably.

A MOTOR-CAR belonging to Capt. Winterbottom swerved into a bank at the side of the road about five miles from Buxton. Mr. Hodgkinson, of the motor garage, Buxton, was soon on the spot with break-down tackle, and took the car to his premises, where it was found to be completely wrecked.

### A POINT FOR TRAVELLERS.

AMONGST some summonses taken out by the Inland Revenue at the Lambeth Police Court, recently, was one against a traveller for keeping a motor-car without a licence. It appeared that the defendant used the car for the purposes of his business and carried with him some samples of shredded wheat. A solicitor appearing for the defence urged that, being used solely for the purposes of trade, the car was exempt from the licence duty. Mr. Simpson, who represented the Excise, whilst admitting that there was no evidence that the car was not used entirely for business purposes, contended that it did not come within the exemption clause of the Act, inasmuch as it was not a vehicle constructed or adapted for use "and used" solely for the conveyance of any goods or burden in the course of trade or husbandry. This was a vehicle constructed and adapted for the carriage of persons rather than of goods.

Mr. Francis upheld the contention of the Excise, remarking that if the view set up by the defence were correct, one could conceive thousands of carriages, doctors' carriages and so forth, which could claim exemption. He imposed a penalty of £2 10s., that sum to include the licence duty, £2 2s.

### OBSTRUCTING A MOTORIST.

AT the Maidenhead County Bench an example has been made of a driver of a brake who obstructed a motor-car belonging to Mr. J. L. Keene, of Henley-on-Thames. When the obstruction occurred the latter at once reported the facts to the Motor Union, who thereupon instructed Mr. C. H. Dodd to prosecute. The offence occurred near Ascot. Mr. Keene, according to the evidence, was about to overtake the brake, which was then travelling slightly on the off-side of the road, the road being clear of other traffic. The driver ignored the horn, and although Mr. Keene also shouted to him, he deliberately drew to the off-side so as to block the passage of the car. Mr. Keene managed to pass with his off wheels in a ditch, but, in doing so, he came into collision with part of the horse's harness, which damaged the car. The Bench fined the defendant 10s. and 4s. 6d. costs.

### CASES AGAINST MOTORISTS.

THE adjourned hearing of two summonses against Josiah Coe, a driver in the employment of the London Motor Garage Company, took place at the West London Police Court, before Mr. Lane, on the 24th July last. Earl Russell, instructed by Messrs. Amery-Parkes, solicitors for the Automobile Association, appeared for the defendant in both cases. The first summons was for unlawfully driving a motor-car at a speed which was dangerous to the public along Holland Park Avenue on the 17th June. The second summons was under Article 4 of the Motor Car Use and Construction Order, 1904, for not giving audible and sufficient warning of the approach or position of the motor-car upon the same occasion. The first summons having been dismissed, the second case was then gone into. It was admitted that the defendant did not blow his horn. It was true that he was passing Royal Crescent, which turned into the main road, but as he did not see anything coming out, there was no need to sound it. Mr. Lane stated that it would be very stupid of him if he held that the driver of a motor-car had to sound his horn whenever passing a cross road, but that in this case he thought that, especially at the time the offence was alleged to have taken place and the amount of traffic which was on the road, it was necessary for the horn to be sounded, and that the driver made no attempt whatever even to slow up when passing Royal Crescent. He inflicted a fine of £3 and 2s. costs. After some argument the magistrate reduced the fine to £1 and 2s. costs to allow for the costs in the first case.

At the North Holland Police Court, Henry Mays, of Bourne, was

summoned for having driven a motor-car recklessly, and at a speed dangerous to the public, at Fishtoft, on the 14th ult.; and also with not having stopped on an accident happening to a cyclist. He pleaded not guilty. The Bench imposed a fine of £2 in the first case, and £3 in the second, with costs, and the solicitor's fee (£1 1s.).

MALCOLM HENRY STEIN, chauffeur, was indicted at the Old Bailey for the manslaughter of William Alves, who was with him in a motor-brougham when it crashed into a cab coming in the opposite direction. The passengers and the cabman were hurt, and Alves received such injuries from being thrown out of the brougham that he died a few hours afterwards. Stein was driving on the wrong side of the road. Giving evidence on his own behalf, he accounted for his dazed appearance by the effect of the accident. Let any man, he aided, drive a motor-car for ten or twelve hours in London, as he had done on that day, and his eyes would be swollen, as the doctor said his were. The jury found him not guilty and he was discharged.

GEORGE HANDESYDE, of 103, Ivy Road, Cricklewood, was remanded at Newport, on Saturday, charged with the manslaughter of Frank Fisher, by running him down with a motor-car the previous day. He was remanded on bail for a week.

ON Saturday, at Windsor, Charles Pecqueux, chauffeur to Mrs. Vanderbilt, was summoned on a charge of recklessly driving a motor-car on June 23rd at Ascot. Lord Lonsdale stated that on the Saturday morning in Ascot week he was in a motor-car about three-quarters of a mile or so from the grand stand on the London side, and going towards London, when he heard the sound of a motor-horn behind, and held up his hand as a warning to the car behind, because two gipsy vans were coming in the opposite direction. He heard the horn again, and again held up his hand, and so did Lord Lurgan, who was with him. Another van came in sight, so that there were three altogether. The witness steered to the left, and the car following passed his right side, and nearly took off his wheels. He shouted to the driver to look out for the children; he did not stop, and narrowly escaped running over some children. The dust was so great that he could not take the number of the car. Later it stuck on a hill by Lord Stanley's place, and the witness followed and took the number. Lord Lonsdale added that his own car was slightly damaged by the defendant's car, in which some ladies were riding. He had never seen more wanton, reckless, and dangerous driving. The Bench found the defendant guilty of reckless driving, inflicted a fine of £10, and ordered the licence to be endorsed.

### POLICE TRAPS.

SEVERAL danger points have been reported on the London-Eastbourne road.

THERE are traps on the main road from Windermere to Dunmail Raise.

AT Sheldon, on the Coventry road a police trap has been established.

YORKSHIRE motorists should beware of the police trap between Barnby Moor and Etherley.

ON the occasion of Goodwood races, the Automobile Association cyclist patrols were on duty on the following roads:—London, Godalming, Chiddingfold, Northchapel, Petworth to Goodwood, instead of the Haslemere and Midhurst route, as previously arranged; Goodwood via Old Shoreham Road to Brighton; Sutton to Reigate; and from Croydon through Crawley to Brighton.

THE police trap on the Chichester Road, Arundel, extends over a quarter of a mile, and has resulted in several captures during the last few days.

### TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

Photographers, both professional and amateur, are invited to send photographs of current events or of motoring scenes and incidents. The fee, if any, required for reproduction should be stated in each case; otherwise no liability will be accepted.

# THE Motor-Car Journal.

VOL. VIII.]

LONDON, SATURDAY, AUGUST 11, 1906.

[No. 388.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

## COMMENTS.

WE are not so certain as are those who write letters to the papers that the dust of the roads is wholly detrimental to the fruits of trees. Much has been said of late as to the destruction caused by the dust and the loss to farmers; but now comes an authoritative assurance in the columns of the "Devon and Exeter Gazette"

that the excellence of the apple crop in Somerset this year is owing to the dust which has been so plentiful and which has absolutely destroyed the blight which threatened the crops. For many years the crops in the county have been poor—certainly below what the growers had a right to anticipate; this year's yield, however, promises a record, and we are glad to learn, on the authority of a really reliable source, that the motor-car, by raising the dust, has contributed to such a result. When the growers adequately recognise that the use of the automobile will facilitate the conveyance of fruit to the market their prosperity should be complete.

### The Club's Certificate.

OFFICIAL recognition of the examination scheme of the A.C.G.B.I. is now coming from all quarters. The authorities of New Scotland Yard were the first to acknowledge its value by insisting that no one should drive a police motor-car without first obtaining the certificate of the Club. Now the General Purposes Committee of the Worthing Town Council is recommending that every person applying for a licence as a motor-car driver shall be required to submit a certificate of efficiency from the A.C.G.B.I., "or other association of equal authority and standing." Certainly the latter will be difficult to find. It would therefore appear that the time is not far distant when the possession of the Club's certificate will be as helpful to public service drivers in obtaining situations as it is to those in private service.

### Motor-'bus Racing.

GOODWOOD and other popular race meetings are to have rivals in the Strand and other thoroughfares in the West End of London, where the drivers of competing motor-'buses seem anxious to pass each other, and to give their passengers some of the excitement of the racecourse. It must be confessed that often the occupants of the outside seats are as keenly interested in the pursuit as the drivers; but whether their enthusiasm can be regarded as aiding and abetting the dangerous proceeding is a matter of legal nicety not yet determined. As to the liability of the driver there is "no manner of a shadow of a doubt," as has been proved in the cases referred to in our "Public Motor Services" on another page, and at Westminster, where a motor-omnibus driver was summoned for driving in a manner dangerous to the public. The solicitor who supported the summons, on behalf the police, said that the defendant, in order to pass an omnibus belonging to a rival company, drove the wrong side of a pedestrian refuge, thus endangering the lives of several persons crossing the road. The

magistrate said that this thing was continually being done, and walking about London largely as he did he saw a great deal of it. To pull round a refuge to gain an advantage over a rival omnibus was reckless driving, and of a most dangerous character. As a matter of law, he (the magistrate) was prepared to hold that any driver who drove the wrong side of a refuge must show that he did so for the safety of his passengers. If he could not do that, there would be a conviction in every case.

### The Selection of Routes.

THERE are some points of the Report of the Select Committee on London Cabs and Omnibuses which have an interest to those interested in the development of motor traffic in cities and towns. One sensible recommendation has reference to the routes of such vehicles, it being rightly suggested that these should be sanctioned by the authorities, which would thus be able to keep motor-buses to main avenues until they become quieter and less provoking to the inhabitants of fashionable squares and quiet streets. No objection is made to the present speed limit of twelve miles an hour for motor-buses plying for hire in the London streets, but it is advised that this should be rigorously adhered to, the police to take stringent action where it is being exceeded—a hint they are already acting upon, judging by the numerous appearances of motor-bus drivers in the London police-courts of late.

### An Efficient Silencer Defined.

ON the invitation of the Competitions Committee of the A.C.G.B.I., the Technical Committee of that body has been invited to state what, in its opinion, constitutes an efficient silencer in relation to sporting competitions and touring cars generally. The need for this has been generally felt at competitions during the season, and it will be interesting to see how far the definition is regarded by officials in the contests that remain to be decided. According to the Technical Committee of the Club, "apart from any question of back pressure, an efficient silencer is one which renders the emission of the exhaust gases from an engine inaudible under ordinary running conditions at the distance of 10 yards from the side of a car in an open road, and which is practically gas-tight everywhere except at the proper outlets."

### The Army Motor Reserve.

A ROYAL WARRANT promulgated before the holidays has given food for discussion in military circles, and, although many will regret the disbandment of the Motor Volunteer Corps, all will appreciate the recognition of the motor-car as an effective weapon of military service. An Army Motor Reserve of officers is to be established, commissions to be granted to members of the late Motor Volunteer Corps, and to such other persons as may possess the necessary qualifications. An officer of the Army Motor Reserve will have to be in possession of an efficient motor-car and be required to place his car and his services as driver at the disposal of the Army Council during not less than six days in each year. Retirement will be compulsory at the age of sixty. Officers of the Army Motor Reserve

employed at home will receive such rates of pay and allowances as may from time to time be determined, the rates at the outset being as follows:—30s. a day for not less than six hours for the use of the car, 3d. a mile petrol allowance, detention allowance of 12s. 6d. if necessarily detained for the night. Officers of the Army Motor Reserve called to Army service at a time of emergency will receive, in addition to the allowances of their regimental rank, pay at the following rates:—Lieutenant-colonel, 24s. a day; major, 19s. a day; captain, 15s. 6d. a day; lieutenant, 10s. a day; second lieutenant, 7s. 9d. a day. Officers will be required on being called to Army service at a time of emergency to give the Army Council the option of buying or hiring their cars at a price or rate to be assessed by a committee on which officers of the Army Motor Reserve shall sit.

#### Motor Volunteer Corps.

THE Motor Volunteers have had a short but eventful history. In 1901 the automobile assistance which Mr. Mark Mayhew, then an officer in the Imperial Yeomanry, was able to give to Sir Evelyn Wood and Sir Redvers Buller at the manoeuvres suggested the formation of an organised body of motorists prepared to serve their country if need be. Mr.

The 12-15-h.p. Arrol-Johnston Car which won the Gold Medal in Class 2 in the Scottish Reliability Trials.

Mayhew secured the co-operation of several well-known motorists in a project for the permanent establishment of a Motor Volunteer Corps and then approached the War Office. A committee was specially appointed to investigate the matter, and this reported favourably in November, 1902. In the following March the corps was officially gazetted, since when it has proved its service. Last year 124 duties were performed, occupying an aggregate of 1,321 days. The strength of the corps being reported at 159, this would give an average of about nine days' duty by each officer and member. The total distance travelled by motor-cars on duty was 87,941 miles, and by motor-cycles 10,338 miles.

#### A Novel Commissariat Van.

THERE is scarcely any limit to the value of the automobile in military operations, and in the Volunteer manoeuvres at Swanage on Bank Holiday a new demonstration of its value was given. This was due to the initiative of the 4th Hampshire. Captain Smith, who is in charge of the cyclist section, borrowed from the Bournemouth Corporation one of their motor-dustcarts, and employed it as a commissariat wagon, after, of course, it had been washed out. Under the present scheme of manoeuvres the cyclists are playing a prominent part, covering the country from Lulworth to Shaftesbury with a screen of cyclist scouts. They carry no more than is

essential, and from Wednesday will be engaged in such a fashion that they will sleep wherever they chance to be, and always under the stars. Captain Smith's suggestion that a good scheme would be to borrow a motor-dustcart and turn it into a supply base was patriotically supported by the Bournemouth Corporation. Lord Montagu is thus provided with a movable base. A portable cooking apparatus, food, and a Maxim gun are all on the wagon, which will follow the Hants cyclists five miles in the rear, and be readily accessible when wanted. The Hampshire men are making great use of motor-cycles, of which they have five.

#### The Automobile Association.

VERILY the Automobile Association is justifying its existence and demonstrating to the motoring community that it will still be a field of utility when "police controls"—how delightfully simple the phrase sounds in the Report of a Royal Commission!—no longer spoil the landscape. In the midst of holiday delights come a budget of route guides, contour maps, lists of helpful friends, warnings of suspected places, and other information likely to be of service to the motorist on the road. The London to Edinburgh route card will be useful to those going north, especially as the A.A. scout system, which has succeeded so well in the south, is to be worked in connection therewith until the 14th inst. A goodly number of roads have now been mapped out on the contour plan, with the names of agents printed near to the district for which they are responsible. When we remember that the Association was only founded last year, and that its re-union at the Agricultural Hall Exhibition and the annual dinner have been its chief public appearances, its success seems all the more remarkable. Unquestionably it has discovered a niche of its own in the automobile world.

#### Diplomatic Immunity.

WITHOUT wishing to disturb *l'entente cordiale* between the nations of the world, we would support those British M.P.'s who are being worried by victimised constituents into demanding some revision of the privileges of ambassadors and their suites. Two years ago a case which aroused some ire in America involved one of the British representatives in the United States; recently, the American Ambassador added another to the charges against motorists here, although handsomely purging himself of all suggestion of escaping the payment of fines; and now a question of diplomatic privilege is raised in a matter brought to the attention of Sir Edward Grey by Mr. Simon, M.P. A collision took place in May, in Golden Lane, E.C., between a motor-car (driven, it is alleged, negligently, and belonging to the Marquis de Jacome Correa, of the Portuguese Legation) and a Walthamstow cyclist, who was seriously injured. Both marquis and chauffeur are immune from proceedings in the English Courts, but the marquis, Mr. Simon points out, may waive this immunity as regards his chauffeur. Sir Edward Grey, however, replied that the facts have been brought to the notice of the Portuguese Minister, which is the only action that can be taken. That, however, is not very satisfactory to the cyclist, nor will motorists generally approve of any such immunity under which they, as a body, may be brought into disrepute. What is law for the host should be equally so for the guest—whether ambassador or ordinary visitor.

#### New Club.

IN accordance with our usual practice, the formation of new automobile clubs is given the bolder publicity of large type, and we have pleasure in recording the establishment of an organisation for the benefit of motorists in the Richmond district. This is to be known as the Richmond and District Motor Cycle Club, and, although its scope is thus apparently limited, the extension of membership to owners of small cars will give opportunity for motorists generally to associate together

for mutual help. A programme of meets and similar social events is being arranged, and meetings of a more serious order will be held in the winter, when discussions on matters of practical and technical importance will take place under the auspices of the new club, whose honorary secretary is Captain l'Estrange, 62, Bath Road, Bedford Park, W.

#### Cars at Race Meetings.

THAT railway experts are closely following the progress of the motor-car may be inferred from statistics which have been given by the chairmen at the company meetings held during the last few days. At the meeting of the London and South-Western Railway Company Sir Charles Scotter mentioned that on four days at Ascot this year the number of cars present were 420, 441, 747, and 404 respectively. He rightly concluded that a large proportion of these motorists would have travelled by the line in which he was interested, and would almost certainly have travelled first class. The same

considerable improvement in hull design was noted, although some of the sterns with V transoms did not commend themselves to the artistic eye. The examination by the judges of the machinery and appliances constituting the installation of the vessels of all classes showed a general improvement, not only in the arrangement of the main features, but also of the details, including those of the actuating mechanism, control gear and connections, and pipe arrangements. The engines of the petrol boats have generally participated in the great improvements made in these motors for other purposes. The kerosine engines showed in some cases marked improvement in their adaptation to their purpose, although in some others the objections to the ordinary form of vaporiser, the heaviness of impulse and want of balance of main moving parts, showed themselves almost as conspicuously as heretofore. The use of petrol for starting kerosine engines removes one of the marked objections to the heated vaporiser, but it introduces an objection which in great part destroys one of the main advantages of the kerosine engine. Where the ordinary design of the latter

The Lincolnshire Club's Meet at Asgarby Park. (See page 514.)

remark applied to Sandown and Kempton Park. No doubt all the railway companies serving the great racecourses will suffer from the advent of the motor-car, and be more and more forced to rely upon the cheaper fares for their prosperity. This has also been confessed by Lord Cottesloe at the meeting of the London, Brighton, and South Coast Company, who attributed to motor-cars a considerable adverse effect on their first-class traffic, and to the extension of the rail motor services the decrease in their second and third class returns. This latter, however, supplied compensation to the value of £4,965, for 358,580 passengers had been carried by that means in the past half-year.

#### The Motor-Boat Trials.

THE third annual reliability trials of the Motor Yacht Club were held this year under more favourable climatic conditions than obtained in 1905. Although entries were fewer in number than was the case last year, the vessels competing covered a wide range of type—from the small open launch to the sea-going cruising yacht and the cargo vessel. A

has been adhered to, even when petrol is so used, there remains in most cases much room for improvement on the lines of the best engine practice where petrol only is used. On another page we give the awards in the Trials.

#### Traps in Scotland.

THE prosecution of motorists in Dumbartonshire, and the arbitrary method of dealing with them by Sheriff Blair, has incensed the motoring community in the West of Scotland, and particularly in Helensburgh and Dumbarton districts. The Scottish Automobile Club intervened in a case last week, where one of their members was prosecuted for driving in Helensburgh at forty-seven miles per hour. Mr. Geo. H. Robb appeared for the Club, and although it was brought out in the defence that the car was impossible of such a speed, being a 15-h.p. car carrying five passengers with one cylinder out of action, the Sheriff, on the evidence of three policemen possessing one stop watch and all located at one end of a measured distance of nearly 1,200 yards, convicted, but imposed no penalty, deferring sentence for six months. The Club is still considering

the whole matter of the prosecutions in this court with a view to further action. Their intervention at this stage has been much appreciated by the members in that district.

#### Fair Play in Kintyre.

FORTUNATELY this recently developed vindictiveness is not universal throughout the northern part of Britain, and in the first motor-car prosecution in Kintyre, which has just occurred, the defence was successful. In this a chauffeur was charged with an alleged breach of the road regulations in having failed to stop his car at the request of a man in charge of two horses yoked to a cart. The defendant testified to the receipt of instructions from his employer, Mr. H. Sinclair Scott, to drive carefully—in fact, he got a bonus of half-a-crown a week from Mr. Scott for immunity from accident. After hearing lengthy evidence on both sides the Fiscal said in view of the evidence that had been led for the defence he did not think he was justified in pressing the case. It was quite clear that the car was not going at an undue rate of speed, and that it did actually stop before reaching the carts. In the whole circumstances he did not think he had proved his case, and could not ask for a conviction. Sheriff Wallace said that as the Fiscal had (in his opinion very properly) withdrawn the charge against the chauffeur, there was nothing for him to do except to say that he entirely approved of his having done so for the reason he had stated. The evidence for the prosecution was of such a conflicting character as to leave a doubt in his lordship's mind whether the driver of the cart had held up his hand at all; or even if he did hold up his hand, that he had held it in such a way that the driver of the motor-car must have seen it. While it was no justification for a motor-car driver to say he did not see a signal to stop, if the signal was not conveyed in such a way that a reasonably careful driver should see it there could be no liability on his part for not stopping. Such a sense of fairness is a credit to the administration of the law in Scotland.

#### A Midnight Run.

SOMETHING of a novelty is presented in the programme of the Southern Motor Club—a very active organisation of enthusiastic motorists. They are having a midnight run to Brighton, starting on Friday the 10th inst., at 10 p.m. Three-quarters of an hour later the party will assemble at the Swan and Sugar Loaf at Croydon, where a "roll call" will be made, and where—we quote from the official itinerary—"hotel closes at 11 p.m." After that nothing exciting need be expected till the arrival at the Old Ship, Brighton. The meeting places during the night will be at Mertham, Redhill, Crawley, and Bolney, and as the repair garages *en route* will be closed, a number of the members of the club will carry tow-ropes, and the Croydon "roll-call" will be repeated at each halt, so that none may be left on the road. In these hot days it is difficult to keep cool; we hope the southern motorists will escape the heat of the day, and all arrive in good spirits at London-by-the-Sea, whither, by the way, some members of the club journeyed on a Bank Holiday tour.

#### The Motor-Bus Accident.

ON Tuesday the jury which inquired into the cause of the death of the ten victims of the motor-bus accident at Handcross Hill concluded its sittings, returning a verdict which seems to summarise the conclusions of the experts and other witnesses at the inquiry. They found that the accident was caused by a breakage of the machinery brought on by the efforts of the driver to check the speed of the omnibus when he found it was beginning to go too fast, the machinery not being of sufficient strength to stand the strain. The driver is said to have committed an error of judgment in allowing the omnibus to attain so high a speed before taking means to check it. And then comes this important rider:—"We are strongly of opinion that this type of omnibus is unsuitable for

use on country roads." This is a view that has been previously expressed in these columns. The double-decked motor-bus is certainly not a picnic vehicle, and the natural tendency of people to leave the inside seats for the top cannot be restrained. For such long journeys as that to Brighton the motor char-a-banc provides a possible solution of the problem that should be considered by organisers of such trips.

#### The Glidden Tour.

AMERICAN motorists have been following the proceedings in the Glidden tour with great interest, and some exciting incidents occurred during the event, the route of which was fully described in our issue of the 14th ult. One of the most pleasant features of the run was the meeting of Canadian and American motorists, when the Automobile Club of the Dominion did all it could to make easy the passage of those from the United States. Mr. C. J. Glidden, the donor of the trophy, whose exploits have generally been associated with a British car, accompanied the competitors on a White steamer driven by Mr. Augustus Post.

#### London's New Number.

HAVING regard to the fact that the authority which assigns the letters of identification for counties and county boroughs is the Local Government Board, some surprise has been expressed by the announcement that the London County Council's new index mark is L.N. Such is entirely premature, and nothing but A. and L.C. is likely to distinguish Metropolitan vehicles during the present holiday season; so far, 18,500 motor-cars have been registered in the Metropolis, the first 10,000 being identified with the letter A.; the others have been numbered up to L.C. 8,500. As the L.C.C. will not sit again till the winter, the Motor Car Department called the attention of the Council to the fact that when 1,500 more cars have been registered a new letter will be required, and it was decided to apply to the Local Government Board for a new letter to be used when the 20,000 is reached. We believe the letters L.N. have been suggested, and agree that they would be suitable; they have, however, first to be sanctioned by the L.G.B., and then some weeks must elapse ere their adoption by the L.C.C.

#### In the Parks.

WITHIN the last three months forty-four motorists have been summoned and fined for exceeding the speed limit as defined for closing the park to motor traffic, but, he ominously added, "it depends on the conduct of motorists themselves whether some such step may not be necessary." Certainly, on the figures already made known to Parliament, there is nothing to warrant such procedure. The matter is one of considerable importance to metropolitan motorists, and we would suggest that the Motor Union should not overlook the regulations that may be imposed in parks when drawing up its full report on the views of the Royal Commission. This is one of the incidental subjects that may otherwise cause trouble and irritation after the opportunity for redress has gone.

At the last meeting of the Bridlington Rural District Council, the Rev. G. E. Park, vicar of North Burton, in referring to the traffic of motor-cars, said, "What we want to restrain, curb, and improve off the face of the earth is the prowling, pestilential, petrol-propelled, pachydermatous, phlebotomising pacher." Perhaps he will now inform the Council what to do with persons whose love of alliteration appears greater than their store of common sense.

## THE CREPET CHANGE-SPEED GEAR.

WE illustrate herewith a new change-speed gear for use on petrol cars designed by M. Crepet, a French engineer, which is being introduced into this country by Messrs. J. C. Lyell and Company, Westminster. The gear is of the type in which the pinions are always in mesh, the power being transmitted through the requisite pair by means of keys

Fig. 1.—General View of Crepet Change-Speed Gear.

on the side shaft, which latter has a to and fro motion controlled by the change-speed lever T and arm S.

Referring to the accompanying illustrations, Fig. 1 gives a view of a three-speed and reverse gear-box for cars of from 8 to 12-h.p. with the top half of the case removed, while Fig. 2 shows the details of the sliding side shaft. The clutch shaft A has formed solid with it the pinions C<sup>1</sup>, C<sup>2</sup>, C<sup>3</sup>, which are constantly in mesh with corresponding pinions N, O, P, normally running loose on the side shaft, but any one of which can be instantly locked into position by means of the keys W<sup>1</sup>, W<sup>2</sup>. A feature of the latter is that they are not joined to the shaft, but are formed solid with it. They are placed opposite each other on the shaft; their width is equal to half that of the pinions, while their section is such as to exactly fit the openings in the gear wheels, so that they exercise their work on the whole surface. Unlike its fellows, the pinion R is so fixed that, despite the lateral motion of the shaft, the two must rotate together. A short shaft B has fixed to it at one end the pinion D, and at the other a joint to which a cardan shaft can be attached to convey the power to the rear live axle; or in place of the joint a bevel pinion can be fitted to mesh with a corresponding wheel on the differential shaft in the case of chain-driven vehicles. The shafts A and B are unconnected with each other, except for a frictionless thimble joint, while between the pinions C<sup>3</sup> and D a ball ring is provided. For the forward speeds the power is transmitted through one of the pairs of pinions, C<sup>1</sup>N, C<sup>2</sup>O, or C<sup>3</sup>P, and then from the shaft Y to B through the gear wheels R D. The reverse motion is obtained by means of the pinion C<sup>1</sup>, which meshes, as to half its width, with a small pinion carried on a short spindle centrally below the shafts A Y (not shown in

the illustrations), the intermediary pinion being in its turn continuously in gear with the wheel M, which, like N, O, P, runs loosely on the shaft Y, but can be locked thereto by the keys W<sup>1</sup>, W<sup>2</sup>.

Having now described the general arrangement of the Crepet gear, we may proceed to refer to its special features—that is to say, the points of difference from those of a similar type already in use. In the first place, it will be noticed from Fig. 2 that ball rings are interpolated between each of the pinions on the sliding shaft Y, their object being to carry the friction on the faces of the gear wheels, and to prevent them getting wedged to each other by inclining on their plan of rotation. At one end a ball-bearing thrust, L<sup>1</sup>, is provided, and at the other a thrust piece, L<sup>2</sup>, by means of which the pinions support each other in perfect alignment, provision being made so that the adjustment can be performed outside the gear-box. Another advantage of the ball rings and thrusts is that not only can the shaft be easily moved to and fro to lock one or other of the pinions, but it can be taken out altogether without displacing a single gear wheel. The seat of the wheels, which is equal to half their thickness, has two openings at X<sup>1</sup> and X<sup>2</sup> at opposite sides of the diameter to receive the keys on the shaft Y. The hollow space on each side of the seat is equal to half the thickness of W<sup>1</sup> W<sup>2</sup>, so that when the latter enter one of the circular spaces the pinions all run loose. As these spaces exist in all the loose gear wheels on the shaft Y, there is a neutral point between each speed; thus the driver can stop and start at any of the speeds without passing through the first speed again, and can, in case of necessity, pass from one speed to another, or even stop, without declutching with the foot.

As will be gathered from the illustrations, the gear is both simple and ingenious, one of its strong points, apart from the fact of the pinions being always in mesh, being its compactness.

Fig. 2.—Details of Side Shaft of Crepet Change-Speed Gear.

and consequently relatively small size. It is being made in four sizes, for cars of from 8 to 12-h.p., from 12 to 18-h.p., these having three speeds and a reverse; from 18 to 24-h.p., and from 30 to 50-h.p., with four speeds in addition to the backward motion. In the largest type, which is specially intended for motor-bus work, the two shafts, instead of being located in the same horizontal plane, are arranged one above the other, the gear-box itself being made in three parts.

## CONTINENTAL NOTES.

## The Coupe du "Matin."

The reliability trial which is being organised by the "Matin" of Paris commenced at Versailles on Thursday, the 2nd inst., and will extend until the 28th inst., there being twenty-six daily runs, as outlined below. The only day on which the cars will rest is the 18th inst., which will be spent at Vichy. The following is the itinerary of the trial:—

		Kil.
Aug. 2,	Paris-Deauville ... ..	218
" 3,	Deauville-Granville ... ..	171
" 4,	Granville-Dinard ... ..	148
" 5,	Dinard-Brest ... ..	225
" 6,	Brest-Nantes ... ..	326
" 7,	Nantes-les Sables-d'Olonne ... ..	157
" 8,	Les Sables-d'Olonne-Royan ... ..	256
" 9,	Royan-Bordeaux ... ..	136
" 10,	Bordeaux-Biarritz ... ..	271
" 11,	Biarritz-Pau ... ..	170
" 12,	Pau-Bagnères-de-Luchon ... ..	137
" 13,	Bagnères-de-Luchon-Carcassonne ... ..	250

The Coupe du "Matin" Competition. The Scene at the Weighing in.

" 14,	Carcassonne-Avignon ... ..	270
" 15,	Avignon-Brionde ... ..	276
" 16,	Brionde-Clermont-Ferrand ... ..	159
" 17,	Clermont-Ferrand-Vichy ... ..	131
" 19,	Vichy-Lyons ... ..	202
" 20,	Lyons-Aix-les-Bains ... ..	185
" 21,	Aix-les-Bains-Evian-les-Bains ... ..	200
" 22,	Evian-les-Bains-Besancon ... ..	245
" 23,	Besancon-Gerardmer ... ..	317
" 24,	Gerardmer-Mezieres ... ..	340
" 25,	Mezieres-Amiens ... ..	256
" 26,	Amiens-Boulogne-sur-Mer ... ..	219
" 27,	Boulogne-sur-Mer-Le Havre ... ..	281
" 28,	Le Havre-Paris ... ..	211

The total distance to be covered is about 3,750 miles. Sixty-eight entries were received, and of these forty-nine started, they comprising the following:—Wheel section: Neron non-skid, fitted to a De Dietrich, two Vulcan non-skids (De Dion and Corre cars); Soleil spring wheel (Rochet-Schneider); two Garchey spring wheels (De Dion and Mieusset cars); and an E. L. spring wheel (Delàunay-Bélleville). Endurance class:—

Category 1: motor-bicycles, a Lurquin-Coudert and an Albatros; Category 2: motor tri-cars, two Contals; Category 3: single-cylinder cars, maximum bore 110 mm., two De Dions, a Cottéreau, a Darracq, an Alcyon, and three Lacoste-Battmann; Category 4: twin-cylinder cars, max. bore 130 mm., or four-cylinder ditto, 85 mm. bore, two Darracqs, a De Dion, a Thuault, three Cottéreau, and a Bastaert; Category 5: four-cylinder cars, max. bore 105 mm., two C.V.R.'s, three De Dions, a C.I.A., a Darracq, a Herald, a Panhard, a Clement-Bayard, and a Berliet; Category 6: four-cylinder cars, max. bore 125 mm., three Mercedes, two C.V.R.'s, a Gobron, a Clement, a Darracq, and a Clement-Bayard; Category 7: four-cylinder cars, max. bore 140 mm., two Siddeleys. Perre, on the Albatros motor-bicycle, met with an accident on the first day and had to be taken to hospital. The driver of the Thuault car (Category 4) also abandoned, owing to a broken wheel. Granville was the destination on the 3rd inst., this place being safely reached by thirty-seven of the competitors, while thirty-six arrived at Dinard on the 4th inst.

## The Lederlin Cup.

A hill-climbing competition for the Lederlin cup was held on Sunday last under the auspices of the Automobile Club Vosgien. The contest was over a winding course from near St. Maurice-sur-Moselle to a point close to the mountain known as the Ballon d'Alsace; the distance was 9 kilometres, and the difference of altitude between the starting and finishing points 2,059 ft. The best time of the day was made by Baron de Turekheim on a 60-h.p. De Dietrich (12 min. 46 sec.). The award was, however, made on a sealed handicap, under which the Lederlin cup fell to the lot of M. Goux, jun., who drove a 4-6-h.p. Lion (Peugeot) voiturette.

## The Circuit des Ardennes.

Many of the competitors in the Circuit des Ardennes race, which is to be held on the 13th inst., are already practising on the course. The Hotchkiss cars have been withdrawn from the contest, the reason being that the makers are engaged in

reducing the weight of the vehicles to allow use to be made of wheels with detachable rims ready for the Vanderbilt Cup race. The Luxembourg provincial Government authorities have decided to impose a tax of £8 per car on the machines taking part in the race.

#### Motor-Cabs in Paris.

The number of motor-cabs in Paris is steadily increasing. In addition to 500 which the Renault Company are building; the Clement-Bayard firm have an order in hand for a large number of 10-h.p. vehicles for the Compagnie des Petites Voitures, while it is reported that still another company is being formed with the object of putting 500 12-h.p. vehicles in service.

#### Touring in the French Alps.

The Syndicat d'Initiative de la Savoie, of Chambéry has just issued a series of itineraries to places of interest in the French Alps. The work, which is in two parts, should be indispensable to motorists contemplating a tour in that part of France, as very complete maps are given of each route, together with a profile of the gradients.

One of the two 32-h.p. Siddeley Cars at present taking part in La Coupe de Matin Contest in France. The vehicles are fitted with 32-h.p. four-cylinder engines, and have a wheel base of 10 ft. 4 in. The front wheels are shod with 920 mm. by 120 mm. tyres, and the back wheels with 935 by 135 mm. In all other respects they are of the Wolseley Company's standard type, except that the springs have been slightly strengthened.

#### Public Services in Germany.

The municipal authorities of Dortmund have agreed to take a number of shares in a company which is being formed to run a service of motor vehicles between that town and certain suburbs not provided with tramway communication. A sixteen-seated bus has lately been put on the road between Griesbach and Oppenau.

#### Miscellaneous Items.

The local authorities of Magny-Fouchard (Aube), France, have fixed 15 kilometres (9½ miles) per hour as the maximum speed allowed to motor-cars passing through the town.—A motor-bus service is to be started between the Hotel de Ville and the Porte Maillot, Paris, on the 15th inst.—Twenty-two entries have been received for the contest for the Coupe de Liedekerke, which is to be held in the Belgian Ardennes on the 14th inst. They comprise three each Metallurgique, Minerva, Aries, Miesusset, Darracq, Pipe, and Vivinus, and a Herald.—La Societe Mercedes Electrique is the name of a company which has just been formed in Paris with a capital of £264,000, to build cars on the Lohner-Porsche system.—The German Automobile Exhibition is to be held in the Zoological Gardens, Berlin, from November 24th to December 4th next.

## THE "WAGHORN" POLICE TRAP.

BY SIR ARCHIBALD, J. MACDONALD, BART., J.P.

**A** KNOCK at the door, and my driver promptly admitted to inform me of a "police trap" at Ninfield, in Sussex. We will start at once for the scene of operations, and I will take three other reliable witnesses, as well as my camera, and do what I can to stop both "police persecution" as well as "furious driving." Those were my orders.

We left Bexhill at two o'clock and ran to the quarter distance of the trap in quick time on my 40-h.p. De Dietrich, carefully piloted to the exact spot by one of the "victims" who had given me the information. There was a gate leading into a field of wheat, and over this I climbed, with my camera, to secure if possible, under difficult conditions, my first snapshot of the south end of the "trap." There he was, the "little boy blue," slowly sinking out of sight on seeing my camera into concealment of the green wheat, but the "click" of the shutter was quicker than his "legal limit movements."

Familiarity breeds contempt, so I proceeded to closer quarters and secured another picture at point blank range, which shows one of my assistants leaning over the hedge, looking at my victim, "in camera."

Having much more yet to see to, I returned to my car and drove slowly to the far end of the trap, to the north. Here I was able to "stalk," and photograph unseen, the two policemen at this end, but the thing that bothered me most was that there was no timing apparatus at either end of the trap.

It did not take two of my passengers long to find out that it was artfully concealed in the very centre of the "trap," and thither I proceeded.

I found "Wagflaghorn" in charge, with a professional electrician who presided over this "infernal machine," which was worked as follows. It consisted of an oblong box about 14 in. by 10 in. In the centre of the lid was a watch, and on each side of the watch were two electric press buttons. Note the method of procedure, which I carefully observed while sitting by the machine, while cars were actually running through the trap under supervision of my assistants.

Car enters trap from either end and police in charge press a button, which rings a bell in the aforesaid box, 220 yards distant, in centre of "trap." Electrician in charge, caught unexpectedly, standing some two yards away from the box, and possibly lighting a cigarette or pipe, rushes to box and presses No. 1 contact to stop the bell ringing, and then No. 2 contact to start the watch. How beautifully accurate!

Car passes centre of trap, 220 yards in a given time, then No. 3 contact button is pressed to stop the watch, and No. 4 is pressed, which rings a bell at the far end, either way, for the car to be stopped. That is all, but it is a very expensive, reprehensive, and, I fear, extensive and low-down trick to play on a straight and open country road, to the detriment of my "brothers of the road."

We must band together to defeat the knights of the hedge, alias hedge hogs, and the Automobile Association works its hardest merely to try and secure something more nearly related to equitable treatment than what we have hitherto been called upon to endure. I received every civility from the inspector in charge of the trap, and the same was mutual, but there was something cold about it somehow. He said to one of my assistants that I was obstructing him in the performance of his duties, but on hearing of this I personally challenged that statement, and successfully proved to him that as vice-chairman of the Automobile Association, and a J.P., I was there with the same object as he had ostensibly, to stop or prevent a breach of the law. He seemed satisfied, though very disappointed, and literally "packed up his traps" and withdrew.

So great has been the popularity of the motor house established for the convenience of members of the A.C.G.B.I. in Down Street, Piccadilly, W., that supplementary premises will shortly be acquired.

## SOME CURRENT TOPICS.

### The Prevention of Side Slip.

Many attempts have been made at one time and another to overcome the tendency of motor vehicles to skid or side-slip on greasy roads, but so far no practical result has been achieved. The rapidly-increasing number of motor-buses in the public service renders the solution of the problem more urgent than ever, so that we welcomed the opportunity afforded us of inspecting the arrangement which is being introduced by the Allen Company, of Westminster, and of which a demonstration was given last week in the grounds of the Motor Academy at Notting Hill, W. The Allen system comprises two parts—brakes on the front wheels, and what is known as a steering control. The former consists of contracting bands working on drums connected to the hubs of the front wheels; they are operated by a pedal, and are so arranged that the pressure is

slip which sometimes occur when no brakes are applied, such as "running" side-slip, &c. By grasping both the movable and fixed steering wheels, even with one hand, the back of the car cannot move sideways except by dragging the front of the vehicle around with it, and thus the side-moving force is counteracted by that which is drawing the front of the car in the line of original momentum, and the greater the weight in the front of the car, the greater the force of forward momentum to which the steering control anchors.

### Tests on Grease.

With the object of demonstrating the claims made for the joint system of front wheel brakes and steering control a 10-h.p. Cadillac fitted with both was driven over a stretch of asphalt which had been covered with a slimy mixture of gear oil and grease. As to the "skiddy" nature of the track there was no doubt, as when the car was driven over it and the ordinary brake applied it skidded in a most exciting fashion, the vehicle swinging round until the driver was facing the opposite direction. On another run over the grease only the front wheel brakes were applied, and although the car again side-slipped the skid was not so marked as on the previous occasion. Finally, several runs were made to

A Motor Meet at Chateau-Thierry, France.

applied equally on each of the drums, no matter at what angle the steering wheels are at the moment the brakes are applied. Not only so, but the front wheels are free to move, under the action of the steering wheel, even when the brakes are on. The connection between the pedal and brake drums is by means of wire cable, the ends of which are attached to a sort of double horizontal pulley fixed on an extension of the steering pivots, so that the brakes operate on the same centres as the wheels themselves.

### The Allen Steering Control.

As regards the steering control, this is an exceedingly simple arrangement. The usual steering wheel rotates above and almost in contact with a fluted brass ring, held rigidly by a connection with the steering column. To steer the car, only the usual wheel is turned, but by gripping both this and the brass under-wheel at the moment of applying the brakes the steering wheels are held absolutely rigid in relation to the body of the car at whatever angle they happen to be turned, thus rendering front-wheel braking as safe and practical as rear-wheel brakes. Besides being a necessary adjunct to the brake system, the steering control is intended to prevent those forms of side-

show the efficiency of the joint arrangement. A good speed was got up, and once on the greasy track the driver applied the front wheel brakes and held both the movable and fixed steering wheels, the vehicle sliding along in a straight line without any sign of a side skid. Not only was the capacity of the combined system in preventing the rear part of the car swinging round unexpectedly clearly shown, but it was pointed out that where a car gets out of hand, either on descending a steep hill or other occasion, and the rear portion commences to sway from side to side, the latter can be checked by one hand by means of the steering control, leaving the driver's other hand free to manipulate the emergency brake in addition to the ordinary foot-operated one. Altogether the Allen arrangement appears to be a step in the right direction, and on this account is worthy of the attention not only of manufacturers of motor-vehicles, but also of the engineers of public-service concerns.

ON a site given by Lord Carrington, at High Wycombe, a Church lads' brigade drill-hall, to cost £1,500, is to be built to perpetuate the memory of the Rev. R. Oakley, the motor-cycling curate who met his death last year in a test race of 100 miles.

THE Albion Motor Car Company, Ltd., of Scotstoun, are building a 16-h.p. 24 cwt. delivery van for the Kelso Laundry Company, of Kelso.

THE Academy of Motoring, Limited, have opened a new garage at 1, Chester Street, Grosvenor Place, W., where they have accommodation for garaging about thirty cars.

WHEN in Worthing recently we found the Central Motor Garage in Chapel Road very conveniently located. Not only is a good supply of petrol, oils and greases kept on hand but facilities are available for the charging of accumulators.

THE motor races to be held on the Skegness sands on the 8th prox., under the auspices of the Notts Automobile Club, include an event for racing cars.

MR. A. A. GODIN has issued an album of photographs

of well-known motorists who have testified to their appreciation of the well-known Ducellier motor-lamps.

MR. GLADSTONE has suggested to Sir William Collins, M.P., a conference at the Home Office on the question of motor-ambulances for London.

THE London and South Western Railway Company have just put a 24-h.p. single-deck motor-bus in service between Totton and Lyndhurst.

THE committee of the Technical Institute, Salford, propose to hold a course of automobile lectures next winter. They are now seeking a suitable teacher.

MESSRS. SINGER AND CO., LTD., have lately completed a 9-h.p. tri-car to the order of the Egyptian Government for use as an inspection machine in the desert.

FROM Messrs. Rebour, of Puteaux (Seine), France, comes a copy of the catalogue of Rebour cars. These are made in four sizes—10-12-h.p., 18-22-h.p., 25-30-h.p., and 40-50-h.p., and are largely on Mercedes lines.

MESSRS. R. REYNOLD JACKSON AND CO., LTD., in sending the photograph reproduced herewith, write us as follows:—

"We have recently geared our cars about 15 per cent. higher on each speed, and as we could not find a hill that a 9-h.p. Jackson could not take, with four passengers up, we were interested to see what could be done in the way of hauling other vehicles up a fairly stiff incline, so a day or two ago we took out an ordinary stock car, and mounted Ladbroke Grove Hill, W., with ease,

The 9-10-h.p. Swift Car which secured the Gold Medal in Class 1 in the recent Scottish Reliability Trials.

THE Toronto Automobile Club is considering a movement to organise all the automobilists of the Province of Ontario into a provincial association, the object of which is to secure more favourable legislation, and to look after the common interest and welfare of motorists.

WE learn that the partnership hitherto existing between Messrs. P. R. Lamb, C. H. Lamb, and A. R. Garnett has been dissolved by mutual consent, and that the business of Messrs. Lamb Bros. and Garnett, agents for the National cars, will in future be carried on by Mr. A. R. Garnett.

THE Daimler Motor Company, Ltd., have just issued an interesting and instructive paper model of a Daimler car, consisting of a number of coloured plates, arranged one above the other, showing the "anatomy" of the vehicle. All the various parts are numbered, so that by reference to the index its proper denomination may be ascertained.

A FEW days ago we visited the works of Messrs. Drummond Brothers, Ltd., at Ryde's Hill, near Guildford, and found them very complete and up-to-date in every respect, the equipment comprising a foundry for the production of their own castings. The firm are devoting special attention to the manufacture of small lathes and shaping machines suitable for use in motor-repairing establishments and in private garages.

IN connection with the discussion on the location of motor-car brakes the Belsize London Agency, Ltd., draw our attention to the fact that in the Belsize cars both foot and hand brakes act directly upon the back wheels, the foot brake acting internally and the hand brake externally upon an extra large drum. In the new 1907 models a modification is being made, the hand brake operating upon a drum attached to the driving shaft at the rear of the gear-box, while the foot brake, which bears by far the greater portion of the work, still operates as before directly on the rear wheels.

taking two victoria carriages, weighing 10 cwt. each, with three persons up, the weights of the passengers being 11, 12, and 14 stone respectively. After this, we just managed to reach the top of the hill with the same two victoria carriages and also a horse dogcart, four carriages in all, and the driver. The total weight in this hauling performance was 2 tons 3 cwt., made up as follows:—Driver, 11 stone; motor-car, 15 cwt.; first carriage, 10 cwt.; second carriage, 10 cwt.; and third carriage, 6 cwt."

ORIGINALITY marks the design of the new poster which Messrs. Grose, Ltd., have brought out to acquaint the public with the fact that their non-skid bands were first in the field, and retain a wide measure of popularity with motorists.

MR. J. C. MARTIN has opened a motor garage in the High Street, Lewes.

MESSRS. DENNIS BROS., LTD., Guildford, have recently completed six 20-h.p. 2-ton delivery vans to the order of Messrs. Carter, Paterson and Co., Ltd.

A COMPETITION is to be held with a view to finding a solution of the emission of vapour nuisance—or, at least, a mitigation of the present inconvenience.

WE illustrate herewith two accessories for use in connection with ignition accumulators, which have lately been put on the market by Messrs. Ward and Goldstone, of Strangeways, Manchester. In Fig. 1 is shown the "Indispenso" accumulator charging adapter and polarity indicator. With this device motorists are enabled to charge their accumulators at home or on tour, from any continuous current supply. The adapter A is placed in the lampholder of any bracket or pendant, and the

Fig. 1.

lamp is placed in the holder attached to the device. The plug B is then inserted in the socket holes of the adapter. To find the polarity the two connecting hooks are to be placed together, when the blue point of the needle in the indicator will point to the positive wire; the wires are then broken apart, and the positive wire connected to the + terminal of the accumulator and the other to the - terminal, when charging will commence. Fig. 2 shows the "Multum" generator, for charging accumulators at a minimum cost. They are supplied

Fig. 2.

to work off any direct current electric lighting circuits, and to work from 100 volts to 250 volts down to 10 volts at 8 amperes. They are of English construction, fitted with ring oiling lubricators. The commutators are built up very massively, and the machine can be left running and charging accumulators for any length of time. A switchboard consisting of voltmeter, ammeter, switch and varying resistance, is also being supplied for use in connection with the generator.

A SAFETY brake for motor vehicles is being put on the market by Messrs. Ellis and Taylor, engineers, Southend-on-Sea. The arrangement is such that it automatically stops the engine and applies the brake on a runaway bus or other vehicle. It can also be used by the driver in emergency by slight foot pressure, or by the conductor or other person at the rear of the vehicle by a gentle bell pull.

A NEW motor garage adjoining the Portland Hotel, Queen's Road, Chesterfield, has been opened by Mr. C. J. Czaikowsky.

THE Notts County Council has decided to put up danger signs at each of the three main approaches to Radcliffe-on-Trent.

THE Mexican Ministry of the Interior has just acquired two motor-cars for the use, respectively, of the Inspector-General of Police and of the Fire Brigade.

COUNCILLOR ROBINSON, of Pontefract, has proposed at a meeting of the local council to leave all the roads rough and unrolled as a cure for scorching motor-cars. The proposal was defeated.

MESSRS. DAVID BRIDGE AND CO., of Castleton, near Manchester, in addition to friction clutches, are devoting considerable attention to rubber manufacturing and vulcanising machinery.

MR. GRAHAM NOTLEY, of the Waterloo Motor Works, Chicheley Street, Lambeth, S.E., the British agent for Ader cars, is, we learn, now able to afford intending purchasers a trial run on one of these vehicles.

FROM the A.C.G.B.I. comes a reprint of the paper on "The Field of the Electric Tramway and Motor Omnibus," read by Mr. E. Manville to the members of the club last winter. The statistics he then placed before them are of interest to all concerned in the development of public services.

MR. MACAULEY MORT writes that he has now completed 12,500 miles on his Crossley car, and that it is going as well as ever. The fact that Mr. Mort has been able to keep this car running without the aid of a chauffeur is an excellent testimony to the reliability and simplicity of the vehicle.

MESSRS. J. W. BROOKE AND CO., LTD., have lately completed a searchlight plant to the order of the 1st Tyneside Battalion of Royal Engineer Volunteers for coast defence work. The vehicle is driven by a four-cylinder 15-20-h.p. Brooke engine, and carries a 45-h.p. motor, driving a dynamo, together with searchlight, switchboards and controlling apparatus. The machine in full working order, and with a crew of eight men, can attain a speed of fifteen miles per hour.

AN interesting result of the decision to remove the internal revenue tax on denaturised alcohol is that the U.S. Department of Agriculture has determined to institute a series of experiments for the purpose of obtaining all the information that can be secured regarding the use of alcohol as fuel for internal-combustion engines. Professor Charles E. Lucke has been retained by the Department to direct the investigation, and the work will be carried on at the Columbia University laboratories.

Now that the official results of the Scottish reliability trials have been published attention may be called to the fact that the Pope Tribune Car was not entered by the Service Company, Limited, who are the British agents. The driver had not handled one of these cars for more than about 100 miles before the commencement of the trials, and, however expert a driver may be, this is not sufficient to give the practical experience of a particular car which would enable it to make the best show on any of the points for which marks were given. Allowing for the special circumstances, the performance of the car was a very creditable one.

THE Argyll Company have this week submitted a new vehicle to a road trial from Glasgow to London. The car in question is the first of the Argyll cabs, which are fitted with 14-16-h.p. four-cylinder engines located under the driver's seat. The body has comfortable seating accommodation for four inside passengers, with large luggage capacity on the roof; the over-all length of the vehicle is 10 ft., the wheel base 6 ft. 6 in., and the width 5 ft. 4 in., while it can turn in a circle of 30 ft. diameter. Glasgow was left on Monday morning with a full load, the passengers including Mr. Alex. Govan, of the Argyll Company, and Mr. E. H. Watson, of Argylls, London, Ltd. The journey as far as Kendal, which included the climb over Shap Fell, was made without any gear changes having to be resorted to. As we go to press we learn by telegram that the run from Kendal to Leeds was accomplished without trouble of any kind, the petrol consumption averaging fifteen miles to the gallon.

## CORRESPONDENCE

[Letters to the Editor should be addressed to the offices,  
87-89, Charing Cross Road, W.C.]

### SCOTTISH RELIABILITY TRIALS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—According to the official report, the results published as regards the car which has been awarded the gold medal and our own 24-h.p. Mass car are as below:—

#### MARKS GAINED.

	Hill climbs.	Petrol consumption.	Reliability.	Total.
Gold Medal Car...	67.1	98.8	800	958.9
Mass Car...	98.4	65.7	786	950.1
			Total difference £...	8.8.1

Nine marks were deducted because the car was turned over in an endeavour to avoid a serious collision with other cars stuck on an inefficiently controlled and extremely dangerous hill, viz., Bridge of Avon.

By this report you will see that the car which has been awarded

taking part in the Irish Automobile Club's Open Hill Climb at Ballinacorney, near Dublin, a steep hill of some two miles in length. The car obtained the cup and first place in Class II. under circumstances almost unique in the history of sporting motor events, and which may be of sufficient interest to your readers to secure the insertion of these lines in your valued journal.

The car had arrived within five miles of the course when the engine stopped, and careful examination disclosed the fact that the petrol feed pipe inside the petrol tank at rear had become loose, thus allowing the air pressure to escape and preventing any outflow of petrol to the carburettor. In about an hour the competition was to commence, and prompt measures had to be adopted. The locality was in the depth of the Wicklow Hills, far away from any assistance, but ingenuity overcame all obstacles. Some old rubber connections and copper piping to the acetylene lamps were taken off the car and connected to the inlet pipe to the carburettor. The pipe from the petrol tank had to be cut to allow the rubber connections to be made. An empty tin of petrol was then filled from the tank by using the rubber pump connection as a syphon. The old rubber and metal pipings were then placed to couple up the carburettor to the petrol tin, which was held in my arms as steadily as the Irish roads would allow. This secured a gravity syphon feed, and enabled us to reach the course almost as the last car had started. The petrol was being jerked out of the tin by oscillation, and the old pipes were leaking; but in this condition the car started, and secured first place in its class and the Goff cup. Mr. Hugh P. MacConnell, who was

Mr. C. J. Glidden on the White Steam Car driven by Mr. Augustus Post in the Glidden Tour. (See page 504).

the gold medal scored 958.9 marks, whereas our car, according to their reports, scored 950.1. The Mass car was, as already said, turned over by the driver in his efforts to avoid a very serious collision with a number of small cars which were stuck on the Bridge of Avon hill, which hill was not properly controlled by the committee. For this overturning, although it was booked as a traffic stop by the observer at the time, it not being a mechanical stop in any sense or term of the word, the committee have deducted nine marks for reasons best known to themselves. If you add these nine marks to the total given above, you will observe that the 24-h.p. Mass car is entitled to the gold medal, and not the other car. We wish everybody, of course, to clearly understand that we do not depreciate the performance of the other car in any way whatever; we simply state the figures as given by the committee.

We think it only right to draw your attention and the attention of the public to these facts, as the results published by the Scottish Trials Committee are likely to be very misleading as to the performances of the two cars mentioned. We have formally protested to the committee against the nine marks being deducted from our score and are awaiting their reply before taking any further action in the matter.—Yours truly,

THE LANCASTER MOTOR GARAGE.

### AN EMERGENCY PETROL TANK.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I had the pleasure of accompanying the owner of a 24-40-h.p. Bianchi car on a nine hours' non-stop run from London to Holyhead, and

at the wheel throughout, deserves great credit for the result of this novel event and well-earned victory.—Yours truly,

A. R. LANGTON.

### A STEAM CAR CHALLENGE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the challenge made to me in your last issue to match a six-cylinder Napier car against a steam car, I shall be pleased to do this under proper auspices and in a legal manner, and I think the simplest and best way is for your correspondent to let the contest be decided in the Graphic trophy, if the permission of the Automobile Club could be obtained, as I should not like to be concerned in an illegal race on the road in this country; but I should be quite prepared to send my six-cylinder Napier over to a foreign country where such a competition could be arranged without harm to the cause of automobilism. I should expect the steam car to run under standard touring conditions exactly as it is set out in its own price list it should run.

To give an example of the way the public can be deceived in these hill-climbing results let us compare the price list of your correspondent's car with what actually does take place in practice.

The engine is supposed to be a compound engine with a 3 in. bore high pressure cylinder and 5 in. bore low pressure cylinder, stroke 3½ in. At steam pressure of 400 lbs., which is certainly not below the ordinary working pressure, the engine, if used as a compound engine indicates about 23-h.p. at 400 revolutions, and at the same pressure and same revolutions worked as a simple engine, which is the way it has been

worked in the recent hill climbing competitions, it indicates 50-h.p., or more than double, and while the steam pressure is up to 1,200 lbs., which is somewhere about the pressure that your correspondent starts his hill climbs with, the indicated horse-power at 400 revolutions would be in the neighbourhood of 150-h.p. Does one in a hundred of the ordinary public know that this so-called 18-h.p. steam car can actually indicate at the start of its hill climbs 150-h.p.? I agree that your correspondent admits that in some of the competitions for which he has entered this undue steam pressure for which the engine was not calculated caused it to break, but surely this is the best possible proof that the car was not being used under normal conditions such as the ordinary user would be expected to run his car under, and it is these abnormal conditions that I object to in competitions for *bona fide* touring cars.

I think the car in question is quite an excellent one; I give your correspondent every credit for taking advantage of the rules as they stand, as he has every right to do; but a vehicle which enables one to store up power and use it practically like an explosive in a gun for starting purposes is not running under *bona fide* touring conditions, and especially when this stored-up power once out of three times causes part of the vehicle to break up.

I thank your correspondent for his very sporting offer and I wish him every success in his steam propaganda, as I think by open competition of steam and petrol cars the good and bad points of each will be properly known and understood and each side will strive harder to incorporate in his particular form of motor-car the good points of the other, so that every benefit will accrue to the user by constant and serious competition between every class of self-propelled vehicle, and I think the thanks of the whole motor manufacturing world are due to Mr. Coleman for so ably coming forward and showing what steam is capable of even. But, as I have pointed out, I do not consider them ordinary touring conditions, and I think it would be only right of Mr. Coleman to state clearly that his 18-h.p. engine when used as a compound, as set out in his price list, is nothing of the sort, but at least a 50-h.p. when used as he uses it in his

The 20-32-h.p. Special Darracq which secured the Gold Medal in Class 4 in the recent Scottish Reliability Trials.

hill climbing competitions even at normal steam pressure, but that on starting he can indicate something like 150-h.p., and it certainly seems to me that if he is entitled to do this he should not object to competitors in similar events using oxygen to enable them to have an abnormal petrol engine which is no more a touring vehicle than his own is under the conditions he runs.—Yours truly,

S. F. EDGE.

[The challenge of Mr. Frederic Coleman was for a run up Porlock Hill; possibly the A.C.G.B.I. could arrange matters with the local authorities, as has been done at several other competitions.]

### ACCUMULATOR CHARGING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Replying to Mr. C. Collins's inquiry *re* Boron cells in the *M.C.J.* of the 28th ult., we have at present twenty-four of these cells in use; with these we daily charge 40, 50, 60, and 80 amp. hour accumulators. We find the charges by these cells last much longer than when accumulators are charged by dynamos, and have recently adopted this system entirely. The inspection lamps for inspecting plates whilst forming are maintained by these cells and give excellent results.—Yours truly,

SELENIUM ACCUMULATOR CO.

### THE HORSE POWER OF PETROL MOTORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the many letters on the above subject, I venture to think it is in the various methods of testing employed by different makers the explanation of the startling differences in the horse-power ratings of petrol motors would appear to lie. Taking all in all, it is safe to say that where a maker's catalogue states that his motors have developed a certain power under brake test, they have actually done so and that his statement is a mere record of fact. But it is one thing to have a motor show a tremendous amount of power, considering

its dimensions, when tested under brake, and quite another matter for it to develop the same power under a continued efficiency test. From its very nature the duration of a brake test must be comparatively short; its length is measured by minutes and often by seconds, and forcing a motor to develop an amount of power far beyond its normal output for such a short time presents no insuperable obstacles. If, however, the engine were coupled to a dynamo and run steadily for a period of several hours, in accordance with the usual practice of conducting efficiency tests, the readings would at no time show that any such wonderful amount of power was being developed. The motor that rose to 20-h.p. under the momentary brake test will find its level under the continued grind of the efficiency test and may work out as low as 12-h.p.—Yours truly,

R. SANDERSON.

### THE REPORT OF THE ROYAL COMMISSION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I quite agree with you that on the whole the Report of the Royal Commission on Motor Cars is to be regarded as satisfactory. The only point which in my mind needs amendment is that relating to the taxation, as, if the suggested scale is adopted, it will cause many a would-be motorist of moderate means to think twice ere making the plunge. The introduction of a scale of taxes according to weight is, I admit, a step in the right direction, but I consider that an increase should be made in the limits in the first two classes, especially as the unladen weight of the cars is to include all parts, equipment, stores, fuel, water, or accumulators necessary or ordinarily used with the car when working. If this is carried out, the majority of small car owners will find themselves in the £5 5s. class. Looking at the scale as it stands, I think that the limits should be increased so that all cars up to 15 cwt. should be in the £2 2s. class, and vehicles from 15 to 20 cwt. £3 3s., the others remaining as suggested by the Commission. I should be glad to hear the views of other small car users on the subject.—Yours truly,

W. BENTLEY.

### TYRE STOPPING MATERIALS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to your correspondent's inquiry as to tyre stopping materials, I have found Gamage's "Philkut" satisfactory, but I do not content myself with "simply filling the cut." Not only should all dirt be removed from the cut, and the surfaces cleaned with a rat-tail file, but the surface of the tyre for about  $\frac{1}{2}$  in. around the cut should also be filed clean. The cut should be filled with solution from the bottom, and the excess of solution can then be smoothed down on the surface so as to form a patch about 1-12th in. thick over the line of the cut, gradually thinning off for  $\frac{1}{2}$  in. on each side. I have found such patches last well on the tyres of my 6-h.p. De Dion.—Yours truly,

H. STANLEY BALLANCE, M.D.

### HILL-CLIMBING CONTESTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We read with amusement Mr. W. E. Furneaux's letter in your issue of July 21st, with regard to hill climbing contests, thinking that his little pleasantries were rather a refreshing change from the dogmatic effusions that are generally written on the subject. But surely some of your readers have done your correspondent the injustice of taking him too literally at his word. We fear that in what appears to be an effort to give the A.C.G.B.I. a dig in the ribs, Mr. Furneaux has unintentionally pulled the leg of Mr. E. O. Roper as well as "Fair Play."

For our part we think that Mr. Shrapnell exactly puts before the public what they ought to insist upon. The tireless Mr. Edge and others derive ceaseless joy from the making of formulae and the juggling with weird figures which some of us understand, but many do not. We all, however, understand the value of £100, £500, £1,000—save perhaps the extremely lucky ones among us—and we quite appreciate the difference between carrying two passengers and five, and it appears to us that when all competitions base their classification according to catalogue price only, and work their handicaps on this basis in conjunction with weight of passengers, then only will Daimlers, Napiers, Whites and Stanleys, petrol or steam, be all under fair conditions, and have no grounds for urging that their competitors receive any preferential treatment.—Yours truly,

W. GALLOWAY AND CO.

### DRIVERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It was with much pleasure I read Mr. Percy Richardson's letter. It would indeed be a great boon, both to owners and drivers, if a recognised school could be started. There is not the least doubt there are hundreds seeking first situations, but without any success, owing to owners being afraid to trust them. I myself have for the last five months been trying to get a first place.

I have had five months' training at a garage, during which time I had practical experience in repairs as well as plenty of driving lessons,

But for all this I am always told that I have not sufficient experience, although the firm with which I trained are prepared to give me a recommendation. I am now beginning to think my money has been thrown away, and would strongly recommend anyone who contemplates becoming a driver to think twice before he parts with his money, until some plan is adopted by which proficiency can be assured, and a man make certain that he is not wasting his time and money.—Yours truly;

DISAPPOINTED.

### WHY IS A SILENCER NECESSARY?

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be glad if you or any reader of the *M.C.J.* could inform me why petrol engines require silencers, and why the stroke is not slightly lengthened or the bore slightly increased in diameter until the explosive force of the charge is reduced to atmosphere before the exhaust opens, which would seem to utilise more of the expansive force of the charge and doing away with the noise.—Yours truly,

ENQUIRER.

[We are afraid that "Enquirer" would have a great difficulty in increasing his cylinder dimensions (bore and stroke) so as to reduce the explosive force to atmosphere before opening the exhaust valves. In the first instance the turning movement of the crank would be excessive in comparison with the speed, and secondly, the bore and stroke being increased the volume of gas in ratio would be greater, so practically the only effect would be increase of horse-power. Of course there might be a means of fitting an appliance so as to give a measured quantity of gas, but without doubt this would not be as simple as using a silencer.]

### POPPING IN THE CARBURETTOR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The engine of my car has developed a popping noise in the carburettor. I should be glad if you could tell me the cause, and how to find the faulty cylinder, as my engine has four cylinders, mechanically operated valves, high tension and magneto ignitions. The popping is intermittent; it stops for a few miles and then pops for a few strokes.—Yours truly,

T. E. MULLERSON.

[We should imagine our correspondent's trouble to be due to a faulty inlet valve or perhaps a weak spring on the same. If new springs were tried and valves ground in, a remedy would no doubt be effected. The only means of ascertaining which cylinder is faulty is to try each one individually, releasing the compression on the other three, and by this means finding if there is any back pressure at the air intake of the carburettor.]

### BRAKES FOR MOTOR-BUSES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was interested in the remarks on this subject in the last issue of the *M.C.J.* In my opinion the foot brake should be that acting on the rear road wheels. Undoubtedly the main brake should be that actuated by a pedal, as the driver's hands are then left free for steering purposes, and with it connected up to the rear wheels the vehicle can be properly controlled even should anything happen to the transmission mechanism. Not only so, but as at present arranged the strain of continually starting and stopping the bus is taken by the driving gear, subjecting it to undue wear. It is on these grounds that I suggest the present arrangement be entirely reversed—that the hand-operated brake should be that acting on the transmission and used for emergency purposes only, and that what may be termed the running brake be connected with the rear road wheels and actuated by a pedal.—Yours truly,

R. HENDERSON.

### CHANGE-SPEED GEARS FOR MOTOR-BUSES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to the recent discussion on motor-buses, it appears that the chief trouble lies in the gear-box. Nearly every petrol vehicle is fitted with a change-speed gear of the system known as the train balladeur, in which the outer rims of two rapidly revolving cog-wheels travelling at different speeds are suddenly brought into mesh. It is impossible to conceive how a device so utterly barbarous and unmechanical and against all common sense has so long survived. The gear-box appears to have received but little attention from the inventor and to be at the present time practically in the same state as when the motor-car was first introduced into Great Britain.

With the train balladeur system, however carefully the levers are manipulated, every change of speed or direction must result in a considerable amount of noise and shock to all parts of the car. These continued shocks are bound to soon cause the iron and steel to crystallise and become liable at any time to suddenly snap—possibly causing a terrible fatal accident. The sensible and practical type of gear is the "always in mesh," sometimes called the central key system, in which the change is effected by locking keys sliding into place at the centre of the cog-wheels—where the speed of rotation is least—and is done without the slightest trace of noise or jar. This considerably increases the life of the gears and greatly reduces the cost of upkeep of the car.

With the ordinary gear, should the slightest hesitation or clumsiness be shown in changing speed, only the corners of the teeth on the outer circumference of the cog-wheel—where the speed of rotation is fastest—are brought into mesh, rapidly wearing them away and causing a loud, harsh, grating sound so familiar to all who have had any experience with motor vehicles. With the central key system, on the other hand, should the keys not go home at the first revolution, the keys are resting on a smooth surface at the centre of the pinion, where the speed of rotation is slowest. A neutral is also provided between each speed, so that, should the clutch jam and refuse to come out, the car can be stopped by moving the lever into the next notch, this having the same effect as declutching.—Yours truly,

CONSULTING ENGINEER.

### DRIVING ON TOP GEAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—For many motorists there seems to be a fascination about the use of the top-speed gear in a car equipped with the usual range of change-speed gears. That a vehicle is capable of ascending certain familiar hills on top speed is sufficient to give it a high place in their estimation. Why this feat, as it may be called, should give the car pre-

The Albert Brown Trophy presented to the Motor Cycling Club by Mr. Albert Brown for a Competition amongst Members of the Club for all-British built cars.

eminence they might not be able to say in a convincing way. There are, undoubtedly, advantages in the top-speed capacity, such as noiselessness when the drive is direct, with no change-speed gears in mesh, and for the automobilist who finds no delight in car manipulation there is a pleasant freedom from gear changing. There is, however, another side to be considered. Were weight and cost negligible quantities in motor construction every car could have an engine big enough to dispense with the change-speed gear altogether. Commercially they have to be considered, and the use of the gear-box permits of the necessary economies in these directions. Consequently, if the gear-box is a good thing to carry, it certainly should be a good thing to use.

When a hill is to be climbed that cannot be rushed, failure to change speed means a slowing down of the motor, the result being increase of stresses, which, though they may not cause bending or fracture, certainly do not prolong the life of the working parts of the engine. All things considered, there is no question that an intelligent use of the change-speed gears is necessary for efficient operation.—Yours truly,

L. R. RAINBIRD.

SOLS PETROS.—A firm that has received an order for a barrel of "Sols Petros" is anxious to discover from whence they can obtain supplies.

WE are asked to state that the Napier car which competed in the recent contest for the De Caters Challenge Cup at Boulogne was the 60-h.p. belonging to Prince de Chimay, and that the vehicle met with an accident owing to a side-slip.

A JACK was left upon the road about three miles on the London side of Redhill, by Mr. A. C. Wright, 3, St. Mary's Grove, Gunnersbury, W., on Bank Holiday. Should any reader have found the same the owner will be glad to hear from him.

## CLUBS AND ASSOCIATIONS.

### LINCOLNSHIRE.

MR. GEORGE GODSON'S annual invitation to the members of the Lincolnshire Automobile Club to meet at Asgarby was fulfilled on Thursday of last week, and the event proved even more popular than its predecessors. The competitions took the form of a gymkhana, and amongst the motorists who put in an appearance were Sir Hickman Bacon, Wolseley; Mr. C. W. Pennell, 20-h.p. Martini; Mr. W. A. Tomlinson, 10-12-h.p. Humber; Dr. Cragg, Baby Peugeot; Mr. A. A. Padley, 16-20-h.p. Humber; Dr. Miller, 7-9-h.p. Peugeot; Dr. Mason, 7-9-h.p. Peugeot; Major Goddard, 16-20-h.p. Clement-Talbot; Dr. W. J. Gilpin, 12-h.p. Georges Richard; Captain R. Gleed, Baby Peugeot; Dr. White, 6-h.p. Wolseley; Dr. P. Sharp, 12-h.p. Richardson; Dr. Moxam, Baby Peugeot; Mr. Coombes, 24-h.p. Georges Richard; Rev. M. C. Wilkins, 10-h.p. Argyll; Dr. Benson, motor-cycle; Major J. A. Cole, 16-20-h.p. Humber; Mr. A. W. Holloway, 8-11-h.p. Peugeot; Rev. T. A. Stoodley, 8-10-h.p. De Dion; Mr. B. Gibson, 10-h.p. Richard-Brasier; Dr. W. Jagger, 8-10-h.p. Cadillac; Mr. Parish, Rover, and Dr. Pim; altogether the company numbered nearly 200. Tea and other refreshments were served in a capacious marquee erected in the Parkfield. This function over, some interesting sports were

A French Motor 'Bus Service.—A Snapshot at Villerville, near Honfleur.

commenced. There were about seventeen entries in a speed judging competition. In this event Mr. W. Swain officiated as checker and Mr. Godson took the times. The winner was Dr. Gilpin, of Bourne. His speed was set at 16 miles an hour, and his actual travelling pace was only 10 sec. out in covering a course of 4 1-5 miles; Dr. Cragg, of Billingsboro', and Mr. W. A. Tomlinson, of Sleaford, were equally second, their results being only 15 sec. more than the actual time allowance.

A balancing competition which afterwards took place was won by Mr. W. A. Tomlinson, who was only 34 sec. in getting his balance. Mr. C. W. Pennell, J.P., of Lincoln, judged this contest, and Mr. J. Caswell, of Langrick, took the times. Mr. Godson presented souvenirs to those winning the competitions.

The Lincolnshire Automobile Club's Committee met at Sleaford on Thursday, the 2nd inst., to settle final details for the proposed hill climb in Syton Park. Amongst those present were Sir Hickman Bacon, the club president, and Major J. A. Cole, the chairman of the Administrative Committee. The programme as arranged shows that there will be three events, viz., Class A, for cars not exceeding 10-h.p.; Class B, for cars not exceeding 20-h.p.; and Class C, for cars exceeding 20-h.p. Special prizes will be competed for, including the Newsom Challenge Cup and the Lincoln members' prize for the actual fastest time.

### NORTH LONDON.

FAVOUR'D with beautiful weather, the members of the North London Automobile Club enjoyed the sixth outing of the season. The rendezvous chosen was their country head-quarters at the Red Lion Hotel, Hatfield. Although the majority of the members were taking their holidays, the muster was very good. After tea the party drove about a mile and a half further on to witness and partake in the sparking plug contest. Competitors had to start their engines

on a given line, stop at place marked, take out a sparking plug and insert one handed to them by an official, restart engine and drive to a given point.

The following are the names and times of the first three:—

		Min.	sec.
F. Horton	6 1/2-h.p. Darracq	1	44-2-5
Bransom Griffiths	10-12-h.p. Humber	1	46-4-5
H. Johnson	16-h.p. Horbick	1	51

Mr. Max Graddon was the starter and Mr. J. T. Barber timekeeper.

### PETERBOROUGH.

THIS club brought off a 200 miles reliability trial on the 2nd inst. The competitors started from Peterborough, and the first 100 miles of the run was to Hitchin, returning to Peterborough. The second half of the journey was through Lincolnshire, the route being via Market Deeping, Bourne, Folkingham and Sleaford to Lincoln and back, finishing at Peterborough. The following eight accomplished the distance in eleven hours and thus qualified for gold medals, viz.:—T. Woodman, F. S. Southwell, R. S. Parres, J. Matthews, A. Adams, E. W. Clark, W. Smith and P. R. Heighton. The hon. secretary (Mr. J. Matthews) ably carried out all the arrangements for the trial, assisted by a committee consisting of Messrs. F. S. Southwell, T. Woodman, and F. T. Heighton.

### SUSSEX.

A GYMKHANA was held on Saturday at Eastbourne under the auspices of the Sussex County Automobile Club. The following is a list of events:—Bending Race (1st prize, cup presented by the club; 2nd, club's silver medal).—1, Mr. J. P. Cockerell's 14-h.p. Germain, time, 1 min. 17 1-5 sec.; 2, Mr. V. Lucas's 6-h.p. De Dion, time, 1 min. 24 sec.

Slow Race (1st prize, cup presented by the club; 2nd, club's silver medal).—1, Mr. H. Colgate's 10-h.p. Lanchester; 2, Mr. J. W. Amps's 14-h.p. Daimler.

Lady Passenger Race (1st prize, cup presented by the club; 2nd, club's silver medal).—1, Mr. H. Musker's 35-h.p. Daimler; 2, Mr. V. Lucas's 6-h.p. De Dion.

Tilting the Ring (1st prize, presented by the club; 2nd, club's silver medal).—1, Mr. J. W. Amps's 14-h.p. Daimler; 2, Mr. M. F. Mieville's 40-h.p. Peugeot.

"Bomb" Race (1st prize, presented by the club; 2nd, club's silver medal).—1, Mr. V. Lucas's 6-h.p. De Dion; 2, Mr. H. Musker's 35-h.p. Daimler.

Musical Chairs.—1, Mr. H. Musker's 35-h.p. Daimler; 2, Mr. H. Colgate's 10-h.p. Lanchester. During the day the band of the 2nd Sussex R.G.A. (Volunteers) rendered musical selections. At the conclusion of the gymkhana Mrs. J. P. Cockerell handed the prizes to the winners. The following were the officials:—Messrs. J. P. Cockerell, H. S. W. Eyre, and A. Scrase-Dickens, clerks of the course; starter, Mr. C. F. Frowd; judges, Captain J. G. R. Homfray, Mr. J. Cannington, and Mr. E. E. Miller; marshals, Captain F. D. Lyon, Mr. P. Penraddocke, and Mr. F. H. Nye; timekeepers, Messrs. Bruford; secretary, Mr. M. F. Mieville.

### SHROPSHIRE.

At the representative gathering of Shropshire motorists, at which it was decided to form an automobile club for Shropshire, the following were elected on the committee:—Major Heber Percy, Dr. Stawell, Messrs. Howard McLean, J. Cavan, J. R. Greatorex, Donaldson Hudson, Major F. Forester, C. T. Dugdale, E. C. Peele, E. M. Wakeman, R. Wingfield, C. E. Jenkins, Dr. Russ Wood, and Captain Forester.

### AN IRISH HILL CLIMB.

THE second hill climb of the season under the auspices of the Irish Automobile Club for the season was held on Saturday. The programme was divided into five classes according to the price of the chassis, including tyres, a special prize consisting of a silver cup being awarded to the owner of the winning car in each class and a silver medal of special design to the second. The contest took place on Ballinaslaught Hill, close to Newtownmountkennedy, co. Wicklow, the distance from start to finish being about one mile seven hundred yards; despatched sharp on time and the others following at a four minutes' interval. The best performance of the day was that of the 35-45-h.p. Daimler in Class E, the time returned being 2 min. 24 1-5 sec.

The following are the details:—

CLASS A.—Cars chassis price under £200.			
No.	Driver.	Car.	Min. sec.
1.	F. Wilkinson	8-h.p. Stanley Steamer	5 54 3-5
2.	A. M. Inglis	10-h.p. Adams-Hewitt	6 22 2-5
3.	R. J. McCreedy	10-h.p. Adams-Hewitt	6 44 3-5
4.	A. W. Inglis	10-h.p. Adams-Hewitt	6 55 3-5
5.	Chambers and Co.	8-h.p. Chambers	7 16 2-5

CLASS B.—Cars chassis price under £350.			
No.	Driver.	Car.	Min. sec.
1.	F. Wilkinson	10-h.p. Stanley Steamer	4 40 1-5
2.	Dr. Glenn	10-h.p. Coventry Hunter	5 56 1-5
3.	E. White	10-h.p. Unic	5 58 1-5
4.	G. Swift	10-h.p. Prosper Lambert	6 28 2-5
5.	J. C. Herdman	10-h.p. Darracq	7 8 2-5
6.	H. Bland	10-h.p. Boyer	7 36 3-5

CLASS C.—Cars chassis price under £500.

1. F. Wilkinson...	20-h.p. Stanley Steamer...	2	30
2. A. Rawlinson...	20-35-h.p. Darracq...	3	10 4-5
3. W. R. McTaggart...	16-20-h.p. Argyll...	4	23 1-5
4. G. E. Mills...	12-16-h.p. Clement-Talbot...	4	33 4-5
5. G. Jacob...	15-20-h.p. Darracq...	4	49 3-5
6. G. T. Robinson...	12-16-h.p. Clement-Talbot...	5	14 4-5
7. E. M. Sterling...	15-20-h.p. Unic...	5	20 2-5
8. W. D. Sainsbery...	18-h.p. Argyll...	6	0 2-5
9. Sir W. D. Goff, Bart.	18-h.p. Clement...	6	49
10. J. Robinson...	12-16-h.p. Clement-Talbot...	5	57

CLASS D.—Cars chassis price under £800.

1. Straker and McConnell	40-h.p. Bianchi...	3	37 3-5
2. E. M. Sterling...	36-h.p. Richard-Brasier...	3	43 4-5
3. T. Henshaw...	28-h.p. Daimler...	3	44 3-5

CLASS E.—Cars chassis price over £800.

1. F. A. Bolton...	35-45-h.p. Daimler...	2	24 1-5
--------------------	-----------------------	---	--------

(Dixon and Hutchinson), Teddington (Wolseley), Napier Major (Napier and Sons), St. Helena (Woodnut and Co.), Gazeka (Gardner).

The judges recommend the following awards be made:—

CLASS A.—A gold medal to Messrs. John I. Thornycroft and Co. for Veradaise; a silver medal to the Maudslay Motor Company for Maudslay; a bronze medal to the Wolseley Tool and Motor Car Co. for Eileen.

CLASS B.—A silver medal to Mr. A. J. Fentiman, for Javelin; a bronze medal to Messrs. Camper and Nicholson for Squirt.

SEAGOING VESSELS not under M. M. A. classification, a gold medal to Messrs. Perman and Co. for Wasp; a silver medal to Messrs. John I. Thornycroft and Co. for Firefly.

CRUISERS.—A gold medal to Mr. S. F. Edge for Napier Major; a silver medal to Messrs. Dixon Bros. and Hutchinson for Penguin.

The special award for the best all-British vessel and equipment in each class were won by Veradaise in class A, Javelin in class B, Firefly in the sea-going class, and Napier Major in the cruiser class.

The special prize for vessels using ordinary paraffin of not less than 73 degrees flash point has been won by Messrs. Thellusson and Co. for

Touring in Bohemia. The Bridge over the Elbe at Tetschen.

(Allgemeine Automobil Zeitung.)

ASTON HILL CLIMB.

FOLLOWING our recent announcement with reference to the above competition, Captain Masui has received an official notification from the hon. secretary of the Hertfordshire County Automobile Club, in which he states that the result has been finally come to as follows:—

- First, 14-22-h.p. Germain driven by H. Ramois.
- Second, 10-h.p. Alldays and Onions.
- Third, 60-h.p. Napier driven by C. Edge.

MOTOR-BOAT TRIALS.

THE third annual reliability trials of motor vessels, under the auspices of the Motor Yacht Club of Great Britain and Ireland, was held in Southampton Water at the latter end of last week.

The following were the starters:—Maudslay (Maudslay Co.), Nantilus (Thornycroft), Manapouri (Vosper), Veradaise (Thornycroft), Dion Bouton (De Dion), Eileen (Wolseley), Brooke (Brooke), Gladys (Vosper), Squirt (Fairbanks), Champuk (Thornycroft), Iris (Legros and Knowles), Hebe (Dixon and Hutchinson), Javelin (Blake), Nogi (Parsons), Firefly (Thornycroft), Wasp (Goedhoop, junior), Penguin

Nantilus in class A, Messrs. John I. Thornycroft and Co. for Firefly in the sea-going class, and Messrs. Woodnut and Co. for St. Helena in the cruiser class.

The Autocar challenge cup is awarded this year to Messrs. John I. Thornycroft and Co. for Veradaise, as she is considered by the judges to have made the most meritorious performance irrespective of class.

The silver gilt cup presented by Mr. Montague Grahame White to the mechanic who keeps his engine and vessel cleanest throughout the trials has been awarded to the mechanic of Napier Major.

ROAD REPORTS.

CREMPOID.—On page 366 of our report of the Scottish Reliability Trial, in the *M.C.J.* for June 16th, mention was made of the new dust layer Crempoid as having been noticed at Luss. We now learn from the patentees, Messrs. A. J. Craig and N. Kemp, of Galashiels, that the hotel proprietor there could not keep his windows or doors open on account of the dust from passing motor-cars. He treated the road in front of his hotel for about sixty yards with a 10 per cent. solution of Crempoid, followed in three days by a 5 per cent. solution. This put a skin on the roads that rendered the road dustless for about a fortnight.

and now he finds that a 2½ per cent. solution lasts him two to three weeks. More extended experiments with the same substance in connection with road making are about to be made.

**SURREY.**—The Surrey County Council has received the report of the county surveyor of the result of the experiments—conducted at a cost of £2,000—to grapple with the motor dust nuisance. On the whole, he said, they had not been satisfactory. Tarmac, aconia, and tarring the roads had been tried. The last appeared to be the best and most economical method.

**CLAPHAM AND WANDSWORTH.**—The carriage way in Cedars Road, Clapham, is being dressed with tar as an experiment. The Wandsworth Borough Council has also decided to similarly treat that part of Trinity Road, Wandsworth, which is not paved with wood or tar macadam.

**HAMPSHIRE.**—In the outlying districts of Southampton serious complaints are made of the dusty roads. Of two suggestions laid before the Highway Committee of the South Stoneham District, one from the West End District Council urges that the expense of watering the roads should be borne wholly or in part by motorists who create the nuisance. The second was an offer from Colonel Frank Willan, J.P., to supply sufficient calcium chloride with which to cover 200 yards of roadway. This offer was accepted, with thanks, and the district surveyor was directed to report upon the experiment to be made.

**LINCOLNSHIRE.**—Some little time ago the Lincolnshire Automobile Club approached the Lindsey County Council as to a road of about five miles in length which the Council had decided to close. The road runs under the sea-hills from Chapel St. Leonards to Sutton-on-Sea, and besides being very little more than a rough track, is so narrow that when two vehicles meet one must get into the fields to allow the other to pass, and there are several gates across it. The club did not wish to use the road, but desired to obviate the precedent of a road closed in the county. They therefore asked the Council to allow them to deal with the matter, and the result is that four notice boards erected by the club have proved so effective that the Council has decided not to proceed with its application to close the road. The notices read:—"This road is unfit for motor-cars, and drivers are urgently requested not to use it. Erected by the Lincolnshire Automobile Club," and they are erected at the four approaches to this dangerous and undesirable road.

**STAFFORDSHIRE.**—Several roads in the neighbourhood of Stafford, Leek, Newcastle-under-Lyme and Uttoxeter are under repair, as well as the Lichfield and Burton road, near the former city, and that part of the Lichfield and Walsall road through Rushall village.

**WORTHING.**—The tar coating of the county roads around Worthing seems to be going on on a somewhat general scale. Along the lower road between the Worthing boundary and Lancing the surface is being so coated. The main road through Finton is also to be treated with tar, if a contribution of £8 can be secured from the parish.

**WITHAM.**—Mr. H. Bawtree drew attention at the last meeting of the Witham Council to the experiments which had been carried out by the Woodbridge Council with calcium chloride solution for street watering. He moved that the Council purchase four tons of calcium chloride at 30s. a ton, and that it be used on certain portions of the roads as an experiment. This was seconded and carried unanimously.

**SKIPTON.**—The Council are laying down a length of tar macadam from the station to the Canal Bridge.

### PUBLIC MOTOR SERVICES.

At the meeting of the Great Eastern Railway Company, on Tuesday week, Lord Claud Hamilton said one complaint he had to make was regarding a company which ran motor-omnibuses in London, and which characterised its vehicles as "The Great Eastern" buses. The omission of the word "railway" put that company within the law; but it was none the less inconvenient to the railway company, as they had suffered a great deal from various complaints received from people who considered the accommodation and the service of these buses to be inadequate. As regarded their own motor services in the country, they had not proved remunerative, though they believed that indirectly they were probably run without any loss.

In view of the justifiable outcry with regard to the exhaust from motor-omnibuses, the Expert and Technical Committee of the A.C.G.B.I. intends to make some experiments with a motor-bus fitted with a vertical exhaust delivery carried above the level of the outside seats.

The statutory meeting of the Darracq-Serpollet Omnibus Company, Ltd., has taken place. Mr. J. S. Smith-Winby, the chairman, said the share capital consisted of 200,000 preferred ordinary shares of £1 each, and 300,000 ordinary shares of £1 each. The former were issued at a premium of 1s. per share, and were largely over-subscribed by the shareholders of the Darracq Company. These shares represented the working capital of the new company, and the ordinary shares, which were deferred as to capital and dividend, represented the consideration paid for the acquisition of the business. Two types of omnibuses are to be constructed, one of 25-h.p. for light single-deck omnibuses, such as for some time had been running satisfactorily in France, and a second heavier type of 40-h.p. with double-decks and capable of carrying thirty-six passengers. Two omnibuses of this type will be seen this month in London.

At the Marlborough Street (London) Police Court, on the 3rd inst., Mr. Kennedy had six drivers of motor-buses before him charged with reckless and dangerous driving. Mr. Elliot F. Barker prosecuted on

behalf of the Commissioner of Police, and said that the Commissioner viewed these offences of motor-omnibus drivers very seriously, and special police officers had been detailed off to watch them. Several of the vehicles were driven on the wrong side of the road, a most dangerous proceeding. The attention of drivers was drawn to a recent case in which the Lord Chancellor said it was the duty of persons driving motor-cars or other vehicles on the public highway to remember that nervous, decrepit, deaf, and blind persons and children were just as much entitled to use the highway as the drivers, and if any of the drivers thought fit so to drive that there was a chance of serious consequences through a mistake in judgment or miscalculation, and those consequences were not averted, they would have to pay for it in damages.

SEVERAL motor-bus cases were heard in the London courts on Tuesday. In one, at the Marylebone County Court, a greengrocer was awarded £20 damages against the Road Car Company, one of whose motor-buses had struck his vehicle, doing damage. At three police courts drivers of such vehicles were fined for recklessness, and in the Coroner's Court at Kensington an inquest was held on the body of Mrs. Underwood, who was knocked down by a motor-bus. The jury, in returning a verdict of "Accidental death," added a rider that they exonerated the driver from blame, considering "that the deceased herself contributed to the accident by the careless manner in which she attempted to cross the road."

### THE DU PRE CHALLENGE CUP.

LEICESTERSHIRE, NOTTS, AND DERBY AND DISTRICT AUTOMOBILE CLUBS.

THE final results of the competition for the Du Pre Challenge Cup, held at Hazlewood Hill, reported in our issue of June 30th, together with the order of merit as decided by the A.C.G.B.I., have now been made known. The winner of the cup is Mr. H. E. Barron. In the following table membership of the Leicestershire, Notts, and Derby and District Clubs is denoted by the letters L., N., and D., respectively.

Member.	Club.	Maker.	Mark.	Figure of Merit.
F. A. Bolton ...	L. N. & D.	35-h.p. Daimler ...	4	179.8
W.M. Hutchinson ...	N.	30-40-h.p. Daimler ...	4	181.2
E. W. Wells ...	N.	30-40-h.p. Daimler ...	4	175.0
J. A. Doran ...	L. & N.	22-h.p. Minerva ...	4	208.1
J. A. Doran ...	L. & N.	30-h.p. Rolls-Royce ...	4	171.5
M. Ross Browne ...	L. N. & D.	25-36-h.p. Brasier ...	4	184.5
C. T. Leech ...	D.	18-22-h.p. Daimler ...	2	175.4
Two-seater				
Capt. W. Byron ...	L. & D.	20-h.p. Rolls-Royce ...	4	181.2
R. Cripps ...	N.	24-30-h.p. Argyll ...	4	175.9
G. A. Strutt ...	D.	16-20-h.p. Humber ...	4	189.3
E. Arnott ...	N.	22-h.p. Minerva ...	4	185.8
R. G. Hogarth ...	N.	12-16-h.p. Clement-Talbot ...	5	210.5
J. A. Hooper ...	L.	16-20-h.p. Humber ...	4	174.6
T. C. Pullinger ...	N.	16-20-h.p. Humber ...	4	169.9
L. P. Mell ...	D.	15-h.p. Darracq ...	4	192.1
A. J. Clay ...	D.	20-h.p. Ryknield ...	2	173.5
& 3 cwt. ballast				
H. J. Marsden ...	L.	20-32-h.p. Darracq ...	4	161.2
Capt. W. Byron ...	L & D.	16-h.p. Minerva ...	4	180.0
Dr. H. W. Boreham ...	L.	10-h.p. Darracq ...	4	186.4
H. E. Barron ...	L.	10-h.p. Peugeot ...	4	236.5
G. F. Reading ...	D.	10-h.p. Wolsley ...	4	174.0
C. J. Allin ...	D.	8-10-h.p. Humber ...	4	180.2
R. Sutton Clifford, jun. ...	L. N. & D.	12-h.p. Richard-Brasier ...	4	179.5
C. H. Smith ...	D.	8-h.p. Rover ...	2	160.7
J. T. Eady ...	L.	8-h.p. Clyde ...	4	201.8
H. W. Dawson ...	D.	7-8-h.p. Swift ...	2	174.9

### POLICE TRAPS.

MESSRS. S. DE SAUMAREZ BROCK AND Co. inform us that a trap is worked on Sundays on the main road between Mitcham and Croydon. The traps along the London Road, Norbury, to Thornton Heath are also still being worked on Sundays.

THE Lancaster-Carlisle road is being carefully watched by the police, and at Carnforth and Milnthorpe particular care should be taken by motorists.

ON the Salisbury road, in the parish of Upton Lovel, near Warminster, a police trap has been the means of securing several alleged speedy motorists.

THE utmost care in driving through Helensburgh and thence to Shandon and Luss, as well as from Bowling to Helensburgh, is necessary, in consequence of recent police activity against motorists.

# MACHINE TOOLS FOR MOTOR-CAR BUILDERS.

MESSRS. WEBSTER AND BENNETT, LTD., Coventry, have recently considerably improved the design of their profile milling machine for finishing cams for motor-car engines. The tool is provided with cabinet bases, a trough for lubricant, tray for the workman in front of the fixed headstock, and a rack for spanners at the end. The centres are 7½ in. high, the bed is 6 ft. long, and the floor space occupied is 6 ft. 8 in. by 3 ft. 1 in. The bed has been made both wider and deeper to withstand twisting strains, and is 11½ in. by 10½ in. in cross section. The whole of the machine has been thickened up in section and now weighs about one ton. Moreover, it is driven by a 3 in. belt with a single pulley 12 in. diam. placed at the back, and running at 300 revs. per minute. The machine, which is consequently well suited for motor drives, will deal with 2 5-8 in. motor shafts, which can be admitted up to 4 ft. long. Any number of cams can, of course, be milled, one at a time, but there are usually either eight or twelve cams to the shaft. Almost any cam can be completed in ten minutes. The horizontal cutter spindle is driven through a train of cut spur gears, hardened and running in oil. In fact, the whole of the gearing runs in oil. The cutter is, of course, at the front of the cutter head, overhanging on the left-hand side. The shaft is usually held in a three-jaw self-centring chuck which is slowly revolved by feed motion driven from the cutter head. At the back it carries the copy or former, against which bears a roller carried by the cutter head and kept up to position by a spiral spring. This displaces the weight formerly used and is adjustable by nut at the back. The cam shaft is passed through the hollow spindle held in the chuck, and also gripped at the other end in the nose of the dividing head. This head is clamped to the bed by an eccentric device with handle. The dividing plate gives four positions, according to the number of cylinders. The loose headstock dividing lever is held by spring for all positions, both in and out of the notches. The former or copy plate roller is adjustable by screw to 1/1000 in. When the total drop of the cam leaves too much metal for finishing at one cut, the depth of the first cut can be regulated by means of a hand wheel and screw. Then for the finish the path of the cutter is controlled by the copy plate. For removing the job the same hand wheel is also used to push back the cutter slide, which in the improved machine now has a gibbed strip. The standard machine has two cam shapes, but can be arranged for three. The cutter head, of course, slides to and from the front of the machine on a projection at the back of the bed, its position being governed by the copy plate. The feed motion is driven by a two-speed cone pulley at the back of the cutter head, a belt being taken round guide and tension rollers by which it is kept tight at every position of the cutter slide. The feed is then obtained by double worm and worm-wheel reduction with friction clutch actuated by hand wheel at the end of the machine. The feed is about one revolution in three minutes, so that for setting, roughing, and finishing one cam ten minutes is ample time. One advantage of the machine is that the cams can be correctly formed solid on the shaft, although motor-cars are successfully running with cams that are simply held in place. However, the solid cams can be made smaller and therefore lighter. The machine, with suitable formers, can also be used for milling the edges of nuts, glands and similar jobs, and for brasswork of all kinds. In a machine of this kind a motor shaft with eight cams of steel has been completed in 80 minutes, and a similar steel shaft with four bevelled cams in 50 minutes.

## OBSTRUCTING MOTORISTS.

RICHARD GROVES, brake driver, was summoned at Ongar for persistently obstructing the highway at Ongar. Dr. W. M. Tapp said defendant was driving a char-a-banc full of beanfeasters, and for about two miles refused to let him pass in his motor-car. Fined 10s. inclusive. Alfred Pardoe, brake driver, Highgate, summoned for a similar offence at Stanford Rivers, was fined 10s. and costs 5s. 4d. Defendant obstructed Mr. R. H. Stephens, of Chigwell, in his motor-car.

## A SPARKING PLUG CASE.

At the Marlborough Street Police Court, before Mr. Kennedy, on Thursday, the 2nd inst., Mr. M. C. Friend, Ship Yard, Wardour Street, London, W., was charged with having in his possession for sale and exposing for sale a quantity of sparking plugs to which a false trade description, viz., "Pogon Brevete," was applied. The prosecution was instituted by Messrs. H. M. Hobson, Limited. Mr. Harold Morris appeared for the prosecution and Mr. A. F. Clements, solicitor, for the defence. The defence raised was that Mr. Friend had bought the plugs in question innocently from a Mr. E. Perregaux.

After a lengthy hearing of the case, extending over three days, the magistrate, in giving his decision, dismissed the summonses, stating that the case was one of considerable difficulty; if it had been merely a civil action he might have given judgment for the prosecutors, but as it was a criminal matter he did not feel justified in convicting. On the application of the defendant for costs, the learned magistrate stated that it was not a sufficiently clear case for him to award the defendant costs, and that the trade in spurious plugs was a great hardship to the prosecutors. The magistrate further made an order that one hundred spurious plugs seized under a search warrant at Ship Yard should be forfeited to the prosecutors, Messrs. H. H. Hobson, Limited.

## NEW COMPANIES REGISTERED.

MOTOR ENGINE AND MANUFACTURING COMPANY.—Capital, £2,000. Agreement with British Duplex Motor Engine Syndicate, Ltd.

RICHMOND LAUNDRY, MOTOR GARAGE AND ENGINEERING COMPANY.—Capital, £5,000. First directors, Messrs. C. H. Mason and W. Cherry. Castle Wynd, Richmond, Yorkshire.

RUSHMORE LAMPS.—Capital, £3,000. To acquire the business carried on at 49, Rupert Street, London, as Stewart and Tyler, and to carry on the business of manufacturers of and dealers in searchlights and motor lamps, &c. The first directors are Messrs. G. S. S. Monck, S. F. Tyler, and W. L. Stewart.

## CASES AGAINST MOTORISTS.

A FINE of £5 has been imposed at Brighton on a chauffeur named Thompson, employed by Sir Archibald Macdonald, for driving a motor-car in East Street at a speed dangerous to the public. The police and other witnesses estimated the speed at eighteen or twenty miles an hour, but defendant, his employer, and others suggested that it did not exceed eight miles, Sir Archibald stating that the speedometer, which disregarded anything below ten miles an hour, had registered nothing when passing along the street in question.

CHARLES STURLEY has been charged at the Thames Police Court with

Touring in Italy. The Church of St. Catherine, Pisa.

being drunk while in charge of a motor-car. Defendant was seen in Franklin Street in charge of a car, which he tried to start, but was unable to do so on account of his condition. Mr. Biron said had defendant been actually driving he would have been sent to prison. As it was he would be fined 40s. and 7s. 6d. costs, or in default one month's imprisonment.

At Highgate, Clarence De Vanstey Glentworth was fined £5 and costs for driving a motor-car at Finchley at thirty-eight miles an hour, and 20s. and costs for not having a rear identification plate easily distinguishable.

"You will have to pay or go to prison. People who keep these infernal things can afford to pay fines," said Col. Cones, at Bristol, to William Hayer, a chauffeur, of Peckham, who was fined £5 and costs for driving a motor-car at excessive speed.

HERBERT VALLANCE, surgeon, of School Hill, Lewes, was fined £5 and 15s. costs at Lewes for driving a car in a manner dangerous to the public in that town on the 23rd July. Mr. Lawson Lewis conducted the case for the prosecution, and the evidence went to show that at about one o'clock on the day in question defendant drove his motor-car from the direction of Southover up Station Street in the dangerous manner complained of. Approaching the junction of the cross road at the foot of the hill, in the opposite direction, were two cabs and a brewer's dray, and it was alleged that defendant drove in a dangerous manner between the heads of the horses. The latter had to be pulled up suddenly to avoid a collision. Defendant, on oath, argued that it was only the speed at which he passed the crossing that prevented an

accident, and he could not have restarted his car at the foot of the hill if he had pulled up. As it was, no accident occurred.

For driving a motor-car without a lamp burning to illuminate the rear identification plate, Frederick Lanchester has been fined 10s. and costs at the Sparkhill Police Court. The defendant said the lamp was burning when he left Knowle, but it must have been blown out. It was impossible to keep a lamp alight by Act of Parliament. If he had heard the officer call to him he would have stopped at once, but the roar of the traffic was very great at the time.

THE Hon. Geoffrey Howard, M.P., has been charged at Penkridge Police Court with driving his motor-car to the common danger, and also with driving recklessly. On June 2nd, it was stated, a measured quarter of a mile was set on the Watling Street Road at Weston-super-Lizard, through which Mr. Howard's car passed in 29.2.5 sec., or at a rate of thirty miles an hour. The defendant, in the witness-box, said that he could not say whether he or his chauffeur was driving at the place. It was three weeks before he received any intimation of the offence. Neither the police-sergeant nor constable could say who was driving, and the Bench dismissed the case for want of evidence.

THE Scarborough magistrates have heard a charge against Charles Ives, of Nutley, Rawdon, Bradford, of having driven a motor-car along the Scarborough Valley Park Road at a dangerous speed. Evidence for the prosecution was that the defendant drove along the road at a speed of fully twenty-five miles an hour, and that he ran over two dogs and failed to stop until he had gone a considerable distance. The defendant said he did not stop immediately because he was afraid that the dogs were "a bit cut," which might have shocked his wife very much. The defendant was fined £2 and the costs.

AT the Arundel Borough Bench, last week, John Jarvis, Portsmouth, was summoned for driving a motor-car at a rate above the legal limit on the 26th ult. Major Clay said he considered the car was not travelling more than fifteen miles an hour, and it had broken down at Winchester. Mr. Herbert Clay, who said he had done a deal of horse driving, was of opinion that the car did not travel more than fifteen miles an hour. The Bench convicted and imposed a fine of £3 and 16s. costs.

COLONEL CHARLES CHALMERS was fined £3 at Haddington for driving a motor-car within the borough at a speed more than ten miles an hour. Colonel Chalmers explained that he was in East Lothian on Volunteer business, and asked that as it was an unpaid public service, the case might be treated differently from ordinary cases. The Bench, however, declined to consider this plea.

AT the Doncaster West Riding Police Court a motorist, Henry Stobart, Etherley, was summoned for having driven a motor-car at a speed dangerous to the public, at Rossington, on the 6th ult. He was ordered to pay the costs. For having failed to produce their drivers' licences, Douglas Lee, motor driver, Wombwell; John William Simpson, motor driver, Ackworth; Algernon Beechey Kingsford, schoolmaster, Pontefract; John Coulson, collier, Harlington; and Thomas Howard, barman, Masbro', were mulcted in sums varying from 5s. and costs to £1 including costs.

WHEN the usual long list of summonses against motorists for exceeding the speed limit was begun at Guildford Sessions, on Saturday, a solicitor appealed to the Bench to take into consideration the opinion of the Royal Commission that the speed limit should be abolished. Sir William Chance, the chairman, replied that the magistrates had to deal with the law as it existed now, and the Bench inflicted the usual substantial penalties in all cases.

AT Warminster a batch of motorists have been summoned for exceeding the speed limit on the Salisbury road. The speed varied from twenty-six to thirty-two miles an hour. Fines of £2 and costs each were imposed.

CAPTAIN C. T. B. WOOD, of Queen Street, Mayfair, was summoned for exceeding the twenty mile limit on the Portsmouth road at Cobham on July 22nd, and he was further summoned for failing to produce his licence when requested to do so by the police. Defendant, it was stated, was driving at the rate of thirty miles an hour, and when asked for his licence said he had left it at home. A fine of £3 and 8s. 6d. costs was imposed for exceeding the limit, and the other summons was dismissed on payment of 8s. 6d. costs. The following were also summoned on the same occasion:—William Wickens, thirty miles an hour at Surbiton, fines £2 and 8s. 6d. costs; William Harold Spencer, thirty-two miles an hour at Queen's road, Hersham, fined £2 and 10s. 6d. costs; and Clive Bowring, thirty miles an hour at Portsmouth Road, Walton, £2 and 8s. 6d. costs.

AT Bow Street, Quenton Grogan, a chauffeur, of Sunningdale, East Molesey, was charged with driving a motor-car to the common danger, and with obstructing a police-constable whilst in the execution of his duty. It was given in evidence that the prisoner drove a motor-car on the wrong side of a street refuge at the junction of Agar Street and the Strand, W.C. Police-constable 70 E took his name and address with the view of reporting him for a summons, and he afterwards got down from his car and said, "I have had to produce my licence, and I want to see your warrant." He kept walking round the officer and repeating this, and as a crowd collected and he refused to go away he was arrested. He was fined 40s.

AT the Lancaster County Police Court on Saturday Dr. H. Faulkner was charged with riding an unregistered motor-bicycle at Carnforth. It was shown that the bicycle had been registered in Cumberland, but had not been transferred. The case was dismissed on payment of costs.

JOHN GREENLAND, of Carnforth, was charged at the Lancaster

County Police Court with being drunk in charge of a motor-car at Carnforth on July 25th. It was shown that the car in which the defendant was driving about Carnforth with eight passengers met with an accident, and some of the occupants were thrown out and injured. The police said that when he was apprehended after the accident he was drunk. This was denied by several witnesses. The Bench gave the defendant the benefit of the doubt.

## MOTOR-CAR ACCIDENTS.

A MOTOR-CAR was being driven along Putney Bridge Road at about eight miles an hour, when it suddenly mounted the pavement and knocked down George Thomas Hill, a four-year-old boy, inflicting fatal injuries. At the inquest the verdict was "Accidental death," and the coroner, Mr. Troutbeck, remarked that from the public point of view this was a serious case. There should be a very careful examination of the car in order to have a better idea as to why the failure occurred. The fact that a motor-car might suddenly mount the pavement in the streets of London was very serious. There must be a cause for it, and it must be investigated by competent engineers.

MR. LUXMORE DREW has held an inquiry at Fulham with reference to the death of Alfred Diller, aged 12, who was killed by being run over by a motor-car, at the junction of Wandsworth Bridge Road and New King's Road. Lady Barttelot said that the driver and owner of the car, Mr. Harold J. Teschemaker, was taking her home from Goodwood at the time of the accident. They pulled on to the off-side to pass a line of omnibuses. Suddenly the boy darted in front of the car, hesitated, and then doubled back, with the result that he was knocked down. Mr. Teschemaker also gave evidence to the same effect. He was going at a slow speed because his petrol was running out, and he knew the danger of the road at that spot. The jury returned a verdict of "Accidental death."

THE North Essex coroner on Tuesday held an inquest at Finchingfield respecting the death of a cyclist named Frederick Whiffen, who collided with a 40-h.p. motor-car while descending a hill, and was killed on the spot. The evidence went to show that the deceased man, seeing no chance of passing on his proper side, had to cross over, when he struck the car. The owner of the car, Captain Robert Ogilby, admitted that he did not know the road, and had not sounded his horn. The jury considered him very negligent in not doing so.

## PETROLEUM AS A PLAGUE DISINFECTANT.

[BOMBAY, Wednesday.—Dr. Turner, Officer of Health for Bombay, has successfully demonstrated the extraordinary efficacy of crude petroleum as a plague disinfectant. It is believed that his experiments will materially advance the prospects of extirpating the plague.—Renter.]

When you're strolling in the country and inhaling of an air

Which is fragrant with the perfume of the rose—

Should the vile stench of some motor, as it shoots past, make you swear,

You must never once attempt to hold your nose,

For the evil smell that's wafted on the summer air sublime

Is with disinfecting properties surcharged

That will help you to avoid both Bubonic and Typhoid.

To inhale it with a diaphragm enlarged.

If you want a germ-killer that is sure—

Something cheap that will effect a perfect cure—

Just inhale the petrol gases

Of some motor as it passes,

For their stench could disinfect a common sewer.

—G. M. S. in the "Edinburgh Dispatch."

## TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

Photographers, both professional and amateur, are invited to send photographs of current events or of motoring scenes and incidents. The fee, if any, required for reproduction should be stated in each case; otherwise, no liability will be accepted.

# THE Motor-Car Journal.

## A PRIZE COMPETITION.

### FOR THE BEST AUTOMOBILE "LIMERICK."

OUR readers are familiar with the form of the "Limerick," the best known example of which probably is as follows:—

There was a young lady of Riga,  
Who went for a ride on a tiger,  
They finished the ride  
With the lady inside,  
And a smile on the face of the tiger.

We shall be pleased to offer a prize of one guinea for the best original Limerick, and two second prizes of half a guinea each. The theme is to have reference to a motor-car, motorist, club or association concerned with automobilism, and the matter must be original and not ill-natured.

The Limericks must be sent to the office of *The Motor-Car Journal* not later than first post on Saturday the 25th inst., on postcards, with the author's name and address clearly written.

The winning examples will be published in the same issue

of the *M.C.J.* in which the announcement of the award is made; and it is also our intention to publish a selection from the unsuccessful competitors. The Editor's decision will be final.

We give further examples of the Limerick as follows—not as patterns to imitate or deter, but merely as suggestions:—

A Commission by law was decreed  
Before which car-owners could plead,  
They said their full say,  
Waited many a day;  
And now! Good bye to the limit of speed.

There was a young policeman in blue,  
Who never had much work to do,  
But 'stead of a nap  
He worked a nice "trap,"  
Through which speedy motorists flew.

Duray's just won the big race,  
Sixty-six miles an hour was his pace;  
In the Grand Prix he struggled,  
And with tyres was troubled,  
But at last he has secured the first place.

## COMMENTS.

IN the early days of motoring stories of stray dogs being killed and the subsequent demands of alleged owners for compensation were plentiful. The practice grew awhile, and then seemed to cease. Latterly there has been quite an epidemic of dog killing, and many obviously fair-minded people have deplored the loss of favourite animals and the apparent callousness of some motor-car drivers. Motorists themselves have been among the complainants, and really ordinary courtesy should demand that drivers of cars who have been so unfortunate as to run over dogs should stop when requested. Major A. W. Collings, writing from Limpley Stoke, records that he was on the Glastonbury road, near Bridgwater, the other day, when a motor-car was driven over a dog with deliberate intent. Without adopting his suspicion of *malice prepense*, we do condemn the conduct of the passengers in the automobile, who are said to have turned round, and, when they saw the animal was killed, drove right ahead. Such action is reprehensible.

### The Army Motor Reserve.

We gladly give currency to the appeal made by Lieut.-Col. Mark Mayhew to owners of motor-cars that they should become associated with the Army Motor Reserve, the formation of which was notified in our last issue. Already the main features of this new branch of the regular army have been outlined, wherein it was shown, as Lieut.-Col. Mayhew rightly points out, that it is really only a reconstruction of the corps. Nothing is being destroyed, and the first motor corps ever formed in any army is now placed on a sounder basis, with the object of still further increasing its great usefulness. The constantly growing demands on the resources of the corps have rendered it essential that an effort should be made to augment

its numerical strength. There are a great number of motorists in the United Kingdom who have ample time at their disposal, and who, we feel sure, will readily respond to an appeal to render some service to their country. The headquarters of the Reserve are at 29, Sackville Street, Piccadilly, W.

### Improvement in Drivers.

Now that the evidence which was heard by the Royal Commission on Motor Cars has been published, some of the arguments and statements that led that judicial body to the conclusions at which they arrived are available for public discussion, and will doubtless be reiterated during the next few months. One or two important questions of automobilism are brought to the front, particularly in the evidence of Captain James, the Chief Constable of Northumberland. It is gratifying to know that he is of an opinion that the manners and ability of the hired chauffeur are now on the up-grade. In the early days of the motor-car movement, the driver of a motor-car was generally a mechanic straight from the workshop, who had no knowledge of traffic exigencies or the ordinary rules of the highway. Now motor-car drivers recognise that there are certain unwritten rules of the road which are required to be observed by all who wish to earn the good opinion of those who use them, whether on motor-cars or horse-drawn vehicles.

### The Value of the Industry.

ACCORDING to the Report of the Royal Commission, the capital invested in the automobile industry towards the end of last year was five millions sterling, and 17,000 men found employment therein. Since then the development of the motor-bus alone has enlarged those figures, while the activities of every maker of importance have rendered the estimate considerably lagging behind the actual figures. And if these statistics only refer to the car itself, what is to be said

of the subsidiary trades that have shared in the automobile prosperity? Tailors, certain branches of the leather business, lamp firms, and scores of accessory providers, have all benefited by the circulation of money that has followed the revolution lately effected in locomotion. That impending legislation is not likely to set back the tide of their success is a very satisfactory feature of the outlook. And then, in an incidental way, many other industries have been encouraged by the impetus given to the revival of hotels, and the necessity for improvements of the road. In fact, the automobile is responsible, more than is immediately recognisable, for some of the prevailing national prosperity.

#### Patrolling the Roads.

THE most ambitious task yet undertaken by the Automobile Association has excited great interest and attracted a rush of applicants for membership, which is already over 1,500. To cover 400 miles of road with cyclist patrols in order that motorists may drive to Scotland in comparative immunity from police interference involved careful thought and much tedious preparation. The "Office" car tackled this problem on the Thursday afternoon, when the secretary altered the

Inspecting the Automobile Association's Patrols on the North Road.

dispositions, and engaged extra scouts to the end that excessive speed on the part of unwary drivers could not pass unnoticed or unrestrained by the peaceful patrol. Through Nottinghamshire it was found that a broad-minded Chief Constable prefers his men to walk upright and on the road in view of the public they should, can, and do protect, and discourages the trapping system entirely; but in Yorkshire the scene was changed, and hurried re-organisation of patrols was again required. This done, the Pipe car turned for the South, a few score miles from Scotland, to meet Mr. Gibbons' 50-h.p. Itala, with Colonel Bosworth on board. This took place at the Doncaster Motor Garage, where Mr. Jackson had kept "open house" as a centre for receipt of telegraphed reports from several honorary inspectors. Colonel Bosworth took command, completed his inspection and reached Edinburgh on Sunday evening. His arrival there synchronised with the return to town of the secretary in his travelling office, which had passed through ten counties and over 700 miles of road in four days without mishap to the car, occupants or other road users. There are loud appeals for similar road patrolling during Doncaster race week, the motor traffic there being enormous. The A.A. scout, working peacefully on the road in full view of everybody, will be more useful than the local constable, the glory of whose trapping shines so brightly upon him that he must needs seek the shelter of a thick hedge.

#### Town Carriage Competition.

QUITE distinct from the ordinary touring vehicle is the class of automobile required for the purpose of Society in town. Hence the interest that will attach to the new Trial which the A.C.G.B.I. will hold on October 15th in order to encourage the production of well-studied cars and coach work for covered or semi-covered vehicles. There will be two classes arranged according to price, £600 being the boundary line; Class A being for those below that figure, and Class B for those beyond it. On page 535 we give the points which will be taken into consideration in making the award, and each of them will be judged separately, the vehicles being placed in order of merit under each head. A route of thirty miles will be selected for the purpose of the trial, and only a moderate speed will be expected. The cost of running will not enter into the calculations of the judges.

#### Dangerous Corners.

ANTICIPATING the operation of the suggestion of the Royal Commission that high hedges at sharp corners should be lowered, and that efforts should be made to ease the risks of motorists approaching unknown turns by improving the corners, the Roads and Bridges Committee of the East Sussex County Council has been giving the matter serious attention. More than that, some of the public-spirited landowners within the area of their jurisdiction have come to their assistance, and have consented to action being taken without legislative enactment being necessary. Colonel Rawson, for example, has given orders for the Bolney cross roads, which is one of the most dangerous crossways in the county, to be improved at his own expense. Owners of land adjoining the cross roads at Slaugham, Pitished, Berwick, Boddingham, and Muddleswood are also to be invited to consent to the corners being cut off the banks and hedges being lowered in the interests of public safety generally.

#### Courtesy.

ANOTHER aspect of the question of consideration for users of the road occurs to us in connection with the International Tourist Trophy race in the Isle of Man next month. The last date for receiving entries is the 27th inst., and most of the competitors have already familiarised themselves with the roads, of which, by the way, good reports are to hand. Hospitable Mona is a Sabbatarian island, and permission for the contest to be decided within the little island was accorded on the understanding that Sunday practising should not be indulged in—an undertaking which is likely to be enforced, as is also the speed limit of fourteen miles an hour to cars visiting the island.

#### Trials in Ireland.

WE understand that the trials which the Irish Automobile Club contemplate for next year have been provisionally fixed for June 28th, 29th, 30th, and July 1st. This early announcement may prevent a clashing of the event with the Scottish contest, as unfortunately happened this year, with the result that the trial in the Emerald Isle was somewhat obscured by the larger event in Scotland. Although no definite route has yet been fixed upon, a course of nearly 600 miles for the four days, including a speed test and some hill climbs, has been discussed. This will have to be arranged not only to secure a suitable route, but also to allow for suitable accommodation for those taking part in the event, and, unless this is well looked after, will be found an even greater difficulty than was the case in the Highlands of Scotland. It is suggested that for the first day the objective should be Portrush *via* Newry and Antrim. A circular route to Magilligan's Point and Cookstown and back to Dublin has been thought of for the second, and on the third day an interesting run by the Wicklow Hills through Avoca and Enniscorthy to Waterford will revive memories of

the tour which followed the Gordon Bennett race in Ireland three years ago. From thence the contestants will go back to Dublin via Carlow and Kilkenny. The Irish Automobile Club is taking the matter into very serious consideration, and, whatever is the result of their deliberations, it is hoped that British manufacturers will give them every encouragement, and so make their trial a real success.

#### Railway Interest.

MENTION of the Irish Trials is appropriate in view of the statement made by the Hon. R. H. Nugent at the meeting of the Midland and Great Western Railway Company of Ireland last week, that the company has decided to open a motor garage at each of its hotels, and, although not inclined to regard with favour the motor-car as a competitor in their traffic receipts, is determined to cater for motorists in order to compensate in some little measure for the loss otherwise sustained. The railway companies continue to develop the working of motor-buses, and although the North-Eastern

receipts. Last half-year, for instance, the Great Western Railway Company carried 612,873 passengers by motor-car on the road.

#### Motor-Car Imports and Exports.

THAT the shrinkage in the imports of foreign motor-cars into this country which occurred in May last was a temporary one, due to the labour troubles on the Continent, is indicated by the returns for July, which show that the trade has once more resumed its normal condition. During last month no less than 582 cars, valued at £262,621, were imported into this country; parts were responsible for a further sum of £154,193, giving a combined total of £416,814, which compares with only £349,706 in July, 1905. As regards the imports during the first seven months of the current year, these have amounted to 3,799 cars, worth £1,561,883, and parts to the extent of £1,165,012, the aggregate of £2,726,895 contrasting with only £2,114,630 in the first seven months of last year, or an increase of roundly £612,000. Turning now to the exports

A Peugeot Car among the Natives in Cochin China.

Railway Co. is not making much money from their automobile traffic, the Rt. Hon. Lloyd Wharton, the chairman, has declared that the directors think it is the right policy, as it is by this means that the company is able to obtain compensation for the decrease of traffic receipts. There are now in active N.E.R. service seven motor-buses, sixteen motor wagons, and nine motor char-a-bancs. The Cambrian Railway Company has just made a successful start with a couple of motor-omnibuses between Pwllheli and Nevin, but they will doubtless find the steep gradients in their district a matter of some anxiety. At the Falmouth Chamber of Commerce it has been mentioned that the Great Western Railway Company intends to establish a motor-car service when they can obtain the necessary vehicles; and in Bedfordshire a meeting was held last week to discuss a proposal of the Midland Railway to run a regular motor service to collect milk and market garden produce from the villages. The point that must strike every observer is that each half-year brings with it growing evidence to the railway companies of the value of the motor-vehicle in compensating them for decrease in traffic

of British motor-cars and parts, these, during July, amounted to £54,131, an increase of £22,522. For the first seven months of 1906 the shipments comprised 577 cars, valued at £205,768, and parts estimated at £152,471, the total of £358,239 representing an increase of £162,460.

#### Change in Procedure.

THERE is added interest just now in observing the character of the cases against motorists in the police-courts, and that of the Hon. Geoffrey Howard, M.P., at Penkridge the other day, affords an illustration of a change in procedure suggested by the Royal Commission which is calculated to act more harshly upon the owner of the car than the present regulation. Three weeks after he passed through Weston-under-Lizard the motoring M.P. received a summons charging him with driving to the common danger. He attended the court, and testified that at that length of time from the occurrence he could not say who was driving—his chauffeur or himself. Neither could the police officers who were in charge of the trap

in which he was caught. Therefore the case was dismissed for want of identification. Now, should the recommendations of the Royal Commission become law, a dismissal in such circumstances would be impossible, for the owner as well as the chauffeur would be held liable to conviction, and so, we suppose, either or both might be convicted.

#### Another Association.

DURING the last few weeks we have received several circulars relating to a Dustless Road Association being formed in Birmingham. It is to be hoped that with the multitude of counsellors confusion will not result; the Roads Improvement Association and other organisations are already doing good work, and the proposed association, of which Mr. C. F. Vaughan, of Birmingham, is the hon. secretary, might well become a branch of the older association.

#### Off Side.

It is absolutely impossible for us to chronicle all the cases against motor-'bus drivers which have been heard in the metropolitan courts since our last issue. Space, too, precludes the publication of half the strictures of magistrates against the drivers of 'buses whose delight in going on the wrong side of the roadway is being tempered with fines and threatenings from the authorities. Some magistrates have declared their intention of invoking old Acts of Parliament and sending offenders to prison; others have been inflicting maximum fines; all have been determined in their attitude. Certainly few will quarrel with their stern warning, and as all the modern tendency is in favour of fast travel, all will agree that safety must not be sacrificed in the desire for speed.

#### Automobile Handbooks.

OUR bookshelves are being rapidly filled with volumes of more or less practical value with regard to the motor-car. This week's accessions are all of the commendable kind, headed by Mr. R. J. Meekedy's "Encyclopædia of Motoring," which has grown out of the "Dictionary of Motoring," published in the earlier days of the industry. The idea of the work has been to bring together in convenient form, easily accessible for reference, definitions of all the technical terms associated with motorism, and thus provide a guide both for the novice and the expert. It is a volume to be commended. From Messrs. Iliffe and Sons, Ltd., come two useful books, one being a "Handbook or Guide to the Motor-Car," the other a series of "Useful Hints and Tips for Automobilists."

#### The 'Bus Driver.

MUCH of the romance is going out of the lives of the people with the growing encroachment of mechanical things on the business and the pleasures of this workaday world. There was a splendour and a vim about the old stage coach, with its spanking horses and its halo of excitement, that is absent from its successor that runs on rails, and we are not wholly disposed to believe that even the motor-car will adequately restore the gaiety of those pre-Victorian days. And now the motor-cab is to enter into competition with the jaunting car, and the ancient 'bus driver, with his shiny silk hat, who was wont to form an intermediate link of conversation between all sorts and conditions of men, is to be relegated to the limbo of forgotten worthies. He will be but a memory, and, like many of the characters of Dickens, a relic of the past; or, to be more correct, the passing. The old-fashioned 'bus driver was proud of his horses, of his loquacity, and of his seat of eminence amid the common traffic of the town. But the new driver knows no such elevated view; he more often looks to the ground than the sky, and his place is a secluded spot between the passengers and the engine, right out of sight and sound, so far as the passengers

are concerned. No new race is coming along that will continue the old conditions that have given the 'bus driver a popular place in the public esteem.

#### "Trust Hotels."

WE have received a list of the hotels under the management of the Trust Companies, recently formed as a result of Earl Grey's propaganda on behalf of his scheme of "disinterested management." In addition to being merely a list of such places in the Home Counties, some of the historical notes will be of interest to Southern motorists. In Surrey there are seven hotels under the management of the County Public House Trust Company, and these include that at Burford Bridge, which was a favourite resort of Nelson, and where Keats wrote his "Endymion." Grayswood, Ockley, and Wisley have hotels belonging to this trust, all being provided with motor garages and petrol stores. At Puttenham, between Guildford and Farnham, on the main Hog's Back road, is another inn with ample accommodation for motorists; in fact, this seems to be one of the features of these Trust establishments, viz., that they cater for motorists and have plenty of accommodation for motor-cars.

#### In the Cape Colony.

WHILE Imperial legislators are digesting the proposals of the Royal Commission as a first step towards future regulation in Great Britain, the members of the Cape House of Assembly have been dealing with proposals definitely made as the basis of new legislation in that colony. The Bill before them provides that every motor-car shall be registered with the Council of the division in which the owner of the car resides, and every Council shall assign a separate number to each car. A mark indicating the registered number of the car and the Council with which the car is registered must be affixed to the car. A fee of £1 will be charged by the Council for the registration of cars and 5s. for the registration of motor-cycles. The question of a speed limit is left open, but the punishment for exceeding the limits of reason, as defined by either police or public, is a fine not exceeding £10 for the first offence and not exceeding £20 for the second or subsequent offences.

MR. S. MERCER has purchased the sole rights in the Ailsa Craig Motors, and will carry on the manufacture of the same at his new works at Strand-on-the-Green, Chiswick, under the style of the Ailsa Craig Motor Company.

THE speed indicator entered by Mr. R. B. Kirby in the Automobile Club's speedometer trials, and for which he was awarded a special gold medal for excellence of design, accuracy, and workmanship, was one of Messrs. S. Smith and Sons' pattern with certain improvements designed by him. The judges placed this indicator first in order of merit, but the Automobile Club Committee properly ruled that, as the "Kirby" was an experimental instrument, they could not, therefore, give an award on the same basis as the other indicators. The improvements on the present indicators carried out by Mr. Kirby will be embodied in all Messrs. S. Smith and Son's instruments.

CALLING in at the depot of the Farman Automobile Company, Ltd., in Long Acre, W.C., the other day, we had an opportunity of inspecting the chassis of the 28-h.p. Zusta car, which had just arrived, and for which they hold the British agency. An illustration and brief description of the vehicle, which is of Italian construction, was given in the *M.C.J.* of May 19th last, but we may add that while, generally speaking, the design of the new car follows the lines adopted in the well-known Mercedes type, there are many points of interest comprised in it, the adjustment of the rear brakes being particularly neat. The flywheel, the arms of which are made to act as a fan, is of extra large size, while the change-speed gear is of the type giving a direct drive on top speed through a separate pair of bevel pinions to the differential shaft.

## THE CIRCUIT DES ARDENNES RACE.

BASTOGNE, Sunday.

Great excitement prevails here in anticipation of the annual Circuit des Ardennes race, which is to be held to-morrow. The weighing-in operation took place to-day in the goods yard of the local railway station, the scene being an animated one. Thirty entries were received for the event, but the Panhards, Hotchkiss, the Gobron, and two of the Gregoires were withdrawn, leaving a total of twenty-one. Of these, all but two duly put in an appearance, the absentees being Foxhall Keene (Mercedes) and Pilette (Gregoire). The latter went out for an early spin this morning, and met with a nasty skid near Longlier. The car collided with a wall and was damaged, while Pilette sustained a broken arm and other injuries. In the 1905 event there were fourteen competitors (thirteen heavy cars and one light racer), and in the 1904 race twenty-eight.

With one exception, all the competing cars took part in the recent Grand Prix race. The exception is the Corre, of which illustration is given on page 525, and which will be driven

the contest. No soldiers being available for the guarding of the course, railings have been erected at all the dangerous points and an excellent medical service has been arranged, a doctor being stationed at every ten kilometres. The start will take place at 7 a.m., the competitors being despatched at two minutes' intervals. The appended table shows the order in which the competitors will be despatched, this having been decided by ballot:—

Order of Startg.	Driver.	Car.	Order of Startg.	Driver.	Car.
1.	d'Hespel	60-h.p. Corre.	13.	Hanriot	125-h.p. Darracq.
2.	Hemery	125-h.p. Darracq.	14.	Garcet	125-h.p. Clement-B.
3.	A. Clement	125-h.p. Clement-B.	15.	Salzee	120-h.p. Mercedes.
4.	Jenatzy	120-h.p. Mercedes.	16.	Pierry	110-h.p. Brasier.
5.	Barillier	110-h.p. Brasier.	17.	Gabriel	120-h.p. De Dietrich.
*6.	Pilette	70-h.p. Gregoire.	18.	Demogeot	125-h.p. Darracq.
7.	Duray	120-h.p. De Dietrich.	*19.	Foxhall Keene	120-h.p. Mercedes.
8.	Wagner	125-h.p. Darracq.	20.	Bablot	110-h.p. Brasier.
9.	Villemain	125-h.p. Clement-B.	21.	Sorel	120-h.p. De Dietrich.
10.	Mariaux	120-h.p. Mercedes.			
11.	Baras	110-h.p. Brasier.			
12.	Rouglie	120-h.p. De Dietrich.			

\* Non-starters.

Duray, the Winner of the Race, at the wheel of his De Dietrich Car.

by Count d'Hespel. This is the first racer built by the Corre Co., and is fitted with an engine having four cylinders 150 mm. bore by 150 mm. stroke, constructed by Messrs. Farcot Freres. Although nominally rated at 60-h.p., it will, of course, develop a much greater power. Three speeds forward and a reverse are provided, the transmission being by a cardan shaft and bevel gear on to a live axle. As a result of the experience gained in the Grand Prix race, it is not surprising to find that the majority of the competing cars are provided with *jantes amovibles*, or detachable rims, they being fitted to the Clement-Bayard, Mercedes, Brasier, De Dietrich, and Corre vehicles.

The circuit over which the contest is to be held measures 86.7 kilometres (53½ miles), and as it has to be covered seven times, the total distance is, roundly, 600 kilometres, or 375 miles. The starting point is at Bastogne, where a grand stand has been erected, and the chief places on the route are Longlier, Habay-la-Neuve, Corne du Bois des Pendus, and Martelange. There are no controls or neutralisations, so that it will be possible for the competitors to cover the whole 600 kilometres without a stop. A maximum of seven hours is allowed for the race, any competitor occupying more than that time being held to be out of

## THE RACE.

BASTOGNE, Monday.

The start of the great race duly took place this morning, Count d'Hespel, on his Corre, being the first to be despatched. The only change from the programme was that Burton took the wheel of the Mercedes (No. 10) in place of Mariaux, who was unwell. Hemery (No. 2) was the first to complete the first round, but his pace was not so fast as the majority of the competitors. The best time for the lap was made by Wagner (No. 8), who covered it in 45 min. 29 sec., Salzer (No. 15) being second in 47 min. 15 sec. Altogether seventeen finished the round, the missing ones being Count d'Hespel, who broke a pinion on his Corre car, and Baras (Brasier), who abandoned owing to rim troubles. The second lap was interesting, as it witnessed a struggle for the 100-kilometre record. This fell to Wagner (Darracq), his time being 52 min. 49 sec., as against a previous best, held by himself, of 55 min. 18 sec. Duray made the fastest time in the second circuit, 46 min. 18 sec., a performance which brought him into first place, from which, as the result proved, he was never displaced. Those who retired at this point were Burton

(Mercedes), owing to change-speed lever troubles; Pierry (Brasier), pump troubles; and Demogeot (Darracq), owing to a broken dumb iron. The fastest lap of the day was the third one, which was covered by Jenatzky in 44 min. 37 sec. Duray still led, but only by a minute, Hanriot being close on his heels. The number of competitors was reduced to thirteen, Hemery having retired on account of pump and clutch difficulties. The fourth and fifth rounds saw no change in the first three places, held respectively by Duray, Hanriot, and Clement. In the sixth round the latter had trouble, falling back to seventh place, while the chances of the Brasier team were further cut down by the retirement of Bablot, whose change-speed gear somehow went wrong. In the last round Hanriot made a big effort to overhaul Duray, as will be seen by the fact that he reduced the latter's lead from four to less than two minutes. The fight for the third place between Barillier and Rougier was also exciting, the De Dietrich driver gaining the place by only 16 sec. The appended table shows the total times of the twelve competitors who finished:—

Order.	Driver.	Car.	Time.
			H. M. S.
1	...	Duray	5 38 39
2	...	Hanriot	5 40 21

The Scene at the Weighing-in at Bastogne.

3	...	Rougier	...	De Dietrich	...	5 50 11
4	...	Barillier	...	Brasier	...	5 50 27
5	...	Gabriel	...	De Dietrich	...	5 52 14
6	...	Clement	...	Clement-B.	...	6 2 55
7	...	Sorel	...	De Dietrich	...	6 4 38
8	...	Wagner	...	Darracq	...	6 14 46
9	...	Salzer	...	Mercedes	...	6 14 50
10	...	Jenatzky	...	Mercedes	...	6 15 9
11	...	Villemain	...	Clement-B.	...	6 32 40
12	...	Garret	...	Clement-B.	...	6 51 37

Duray's average speed works out at 106 kilometres or 66½ miles per hour. In last year's event, which was won by Hemery on a Darracq, the winner's time was 5 hr. 58 min. 32 sec., or an average of a little over 63 miles per hour; while in 1904 the contest was won by Heath on a Panhard, in 6 hr. 30 min., or about 57 miles per hour. The event was a victory for the De Dietrich firm, for not only did Duray win, but all the four cars entered finished the contest, securing first, third, fifth and seventh places. The Clement-Bayard team of three machines also went through the race successfully.

A MOTOR torpedo-boat built by Messrs. Yarrow has been inspected by the King in the Solent.

## USEFUL NOTES.

THERE is sometimes a doubt, in the case of a new car, as to which is early or late firing. It should always be remembered that when the contact-breaker is moving in the direction the cam-shaft turns it is moving to "late-firing."

WHEN new cars are brought away for the first time from the works there are usually several little troubles, but by far the most common one is dirt in the carburettor, and as soon as irregular running commences it is as well to take the cover off the carburettor and see if there is any dirt.

A CHATTERING brake is a great nuisance, and often puzzles many people. There are two things which cause a brake to chatter: (1) Badly fitting on drum, and touching unevenly when on; (2) loose connections where it is anchored. The remedy in both cases is obvious.

THE bearings—in plain bearing cars—of the countershaft bracket of a chain-driven car usually show wear as soon as any part, and it is a good tip before replacing them to turn them

round. It is obvious that, owing to the pull of the chain, the wear comes in one place, and consequently by simply turning the bush round it has a new lease of life.

SOME motorists run the sprockets of their chain-driven cars with scant attention, and find eventually that wear has taken place, and that all the teeth are pointing one way, just like a ratchet wheel. It should be noted that, bad as they are, they need not be scrapped, as by changing them over another 1,000 miles, at least, can be got out of them.

SOME clutches, particularly those with broad leathers, are always fierce, in spite of continual dressing. There is, however, a positive cure that is worth knowing. The clutch must be removed, and small flat springs about three inches long should be fixed under the leather in front, i.e., at the nose of the clutch. Three or four of these are required, according to the size of the clutch. These springs can easily be arranged so that they are secured in their centre by one of the clutch leather rivets. The idea of the arrangement is that the springs push the leather up slightly in front, and so allow the nose of the clutch to engage first.

## CONTINENTAL NOTES.

## A Cripple's Motor-Car.

Filled with a desire to enter the ranks of motorists, an ingenious watchmaker of the name of Utikal, of Krelov, near Olmutz, Moravia, who is unfortunately lame on both his legs, has recently built for himself the little car illustrated herewith. The motive power is supplied by a Laurin-Klement 1½-h.p. air-cooled engine, which drives through gearing on to a counter-shaft, and thence by a belt on to a pulley connected with one of

the rear wheels. To start the engine, and also to assist it in climbing hills, the driver is provided with a double-crank handle which operates the chain drive seen in the picture. Steering is effected by means of a tiller, while a hand lever at the side works a jockey pulley, by means of which the belt is slackened and the engine put out of gear. The whole machine weighs less than 1 cwt., and Herr Utikal not only uses it locally but also undertakes long journeys on his novel little car.

## A German Light Car Trial.

The German Motor Cyclists' Union of Munich is organising a reliability trial for light cars for the 23rd, 24th, and 25th inst. The vehicles will be divided into classes on a price basis as follows:—Category 1, from £180 to £250; Category 2, £130 to £175; Category 3, cars up to £125; and Category 4, motor tri-cars and side-cars. On the first day the run will be from Gotha to Luneburg, over a 319 kilometre course; on the 24th inst., from Luneburg to Bielefeld, via Hanover, 244 kilometres; and on the 25th inst. from Bielefeld to Cologne, via Essen, 242 kilometres. The total distance to be covered is thus about 500 miles. On the second day the maximum speed of the competing vehicles is to be timed over a measured distance.

## The Coupe de "Matin."

The reliability trial for the Coupe du "Matin," which started on the 2nd inst., is still in progress. With the arrival at Biarritz on the 10th inst., which completed the ninth stage and the 1,918th kilometre of the tour, the competitors had been reduced from forty-nine to thirty. Unfortunately but little interest is being taken in the event. So far as can be learned there were, on the arrival at Biarritz, sixteen cars without penalisation, and fourteen with a greater or less number of points against them. The two Siddeleys, in the category for four-cylinder cars, max. bore 140 mm., had lost 24 min. and 2 hr. 40 min. respectively. On the 11th the run was to Pau, 170 kilometres, on the 12th to Bagneres-de-Luchon, 137 kilometres, and on Monday, the 13th inst., to Carcassonne.

## The Liedekerke Cup Contest.

The contest for the Coupe de Liedekerke, organised by the Automobile Club of Belgium, was held on Tuesday on the Ardennes Circuit, five laps of which had to be made, giving a total of, roundly, 268 miles. The contest is open for fully-equipped touring cars having a maximum cylinder capacity of 3½ litres—equal to about 24-h.p. While Belgian car builders were conspicuous by their absence in the Circuit des Ardennes race, they were well to the front in the Liedekerke contest, as will be seen from the following table, which shows the competitors and their order of starting:—

Order of Starting.	Car.	Driver.
1 ...	Metallurgique	Wilhelm.
2 ...	Germain I.	Baron de Caters.
3 ...	Minerva I.	Barbasson.
4 ...	Aries I.	Baron Petiet.
5 ...	Pipe I.	Hautvast.
6 ...	Vivinus I.	Fischer.
7 ...	Metallurgique II.	Baron Reinhardt.
8 ...	Germain II.	Ohlendorf.
9 ...	Minerva II.	Porlier.
10 ...	Aries II.	Coquar I.
11 ...	Pipe II.	Jenatz.
12 ...	Vivinus II.	Kuhling.
13 ...	Metallurgique III.	Bruckhardt.
14 ...	Germain III.	Perpere.
15 ...	Minerva III.	Jacobs.
17 ...	Pipe III.	Kinet.
18 ...	Vivinus III.	Baron P. de Crawhez.

The start was fixed to take place at 4 a.m., the competitors being despatched at minute intervals.

As we go to press we learn that the race was won by one of the Metallurgique cars, which are of the standard 24-28 h.p. type, in 5 h. 27 min., the average speed working out at about 49 miles per hour. Last year the event was a victory for Hautvast, on a Pipe, in 6 h. 51 min. 12 sec., an average of nearly 39 miles.

The Circuit des Ardennes Race. Count d'Hespel on the new Corre Racer.

## Miscellaneous Items.

The trophy known as the Coppa d'Oro, which was won by the Fiat Company in the great Italian reliability contest in the spring, no longer exists, it having been destroyed in the recent fire at the Milan Exhibition.—Some experiments with motor-cars in the collection of letters are about to be made by the postal authorities at Gratz, Bohemia.—The special prize presented by the King of Italy in the Motor Omnibus Competition which has been in progress at Milan for two months, and which terminated on the 31st ult., has been awarded to the Darracq-Serpollet steam omnibus.

## SOME CURRENT TOPICS.

### The Dust Nuisance and the Construction of Roads.

At the final meeting of the Engineering Section of the British Association at York last week an interesting paper was read by Mr. Douglas Mackenzie on "Waterproof Roads as a Solution of the Dust Problem." The author contended that there was only one solution of the problem which was satisfactory and permanent, and that was to have a road made of proper dustless material. The foundations of roads should be so strengthened as to be immovable even by the heaviest traffic. Then the surface, which ought to be perfectly smooth as well as waterproof, would be less likely to crumble. The result of this would be a reduction of the highway rate, because of the lengthened life of such properly made roads. Painting by distilled tar, which had been recommended as a solution, was at the best only a palliative. It was desirable to have very

miles one can run on a gallon, and whether the vehicle is performing as well as usual. Sudden changes of condition in the car, evident losses of power, manifested in decreased speed and hill climbing power, are readily noticed as they occur and may usually be traced to their sources by characteristic symptoms. On the other hand, the gradual deterioration in the condition of a motor-vehicle which comes about through extensive use may be hardly noticeable from day to day, but may amount to a very material difference in the quality of its running during a period of several months. The loss of power may have been so gradual during the period that the increased consumption from day to day has been imperceptible, but, in point of fact, the additional amount of petrol required may be very considerable. Very often a motorist is quite impressed with the speed and power of his new car, but after a little while he becomes used to it, its capabilities seem more ordinary to him, and he often thinks it is not doing as good work as it originally did.

### Keep a Record.

If, however, he knows exactly what was his mileage and fuel consumption during a certain trip at the beginning of the season, he has a measure of the car's performance with which he can at any time compare its later condition, if he drives the

Motoring in France—The famous Champs-Élysées, Paris.

exhaustive tests made in continuous lengths of road and under identical conditions as to traffic. This would afford data as to the cost and life of road materials, and in that way the best material would be determined. Arrangements had been almost completed for such a trial to be made on one of the roads of the county council near London. In the districts where roads had been painted with tar the greasy mud which arose from the tar paint was far worse for side slips than anything else which motors had had to encounter, and it had a deleterious effect on cars and carriages. It also treaded into the house and ruined mats and carpets, while household linen acquired a colour which no washing would remove. The cause of that was that the tar adhered to the dust which was already on the road, and in due time, under the influence of the weather, particles of the tar in the dust found their way into the houses.

### Fuel Consumption as a Criterion of a Car's Condition.

The expense entailed for petrol is so small a factor in the total cost of running a petrol car that, as a rule, motorists do not keep a very close record of the rate at which it is consumed in regular use. Nevertheless fuel consumption furnishes a valuable indication of the condition of a car, for it will show the number of

vehicle over the same route under as nearly as possible the same conditions. If the later test shows a greater consumption of petrol he may be sure that the car is in some way not so well "tuned up" as it was at the time of the first run. In this connection the table of the results of the Scottish Reliability Trials, given in the *M.C.J.* of August 4th, will be found to afford some useful information, one column showing the fuel consumption in miles per gallon of the competing cars during the test, which extended over a distance of, roundly, 670 miles. Motorists owning vehicles of any of the types which took part in the competition thus have a means of comparing their fuel consumption, and of ascertaining whether they are obtaining economical results from their own particular machine. At the same time, the very hilly nature of the course followed in the trials in Scotland must not be overlooked, so that in the case of a car used in a fairly level district it should show even a better mileage than that obtained in the event referred to above.

MESSRS. FRANK LITTLE AND Co., 19-21, Westgate Road, Newcastle-on-Tyne, are anxious to communicate with manufacturers of two and three-ton three or four-cylinder motor lorry chassis, designed to meet their special requirements.

MR. H. SEYMOUR, of Norfolk Lodge, Cobbs Hill, near Bexhill-on-Sea, sends a prospectus of a motor-racing track suggested at that seaside resort.

A RULE has been made by those responsible for the management of the King's motor-cars that no vehicle is to remain unused for any length of time, so that the risk of breakdown through inattention to details may be obviated.

THE Weights and Measures Committee of the East Sussex County Council is about to hire a motor-car for the use of its officers, by way of experiment.

MESSRS. THORNYCROFT AND CO. have instructed "The Motor House" to dispose of their stock of 1905 and other models, as they are desirous of making room for their new patterns.

A MOTOR-CAR—a double-cylinder Darracq—valued at £375, belonging to Mr. Hodge, of The Homestead, Bishop's Avenue, East Finchley, has been stolen from a private garage in Baronsmere Road. Mr. Hodge has offered a reward of £50 for the discovery of the thief.

THE operation of cutting wheat at night with a motor lighted by acetylene lamps has been performed on Mr. G. Pope's farm at Biggleswade. A good crop was cut by the Ivel agricultural motor, which hauled two binders at one time and cut thirty-two acres in rather over thirteen hours.

THE Portsmouth road has, now that police traps have been nearly abolished by the scouts of the Automobile Association, many attractions for motorists, who will be interested in the handbook by Mr. C. G. Harper just published by Messrs. Anthony Treherne and Company as a companion volume to that on the Brighton road, recently noticed in our columns.

MR. CHANDOS ELLETON, of Porro Hall, Knott End, was motoring towards Lancaster when the car ran into a swarm of bees. The chauffeur being stung, took his hands from the steering-wheel in order to knock the bees from his face, the result being that the car swerved upon the footpath and collided with a lamp-post. The car was damaged, but the occupants escaped injury.

THE "Mentor" is a classified vocabulary of "words and verbs" in the French language, by Mr. G. B. Wilmot, who acknowledges that the book "explains nothing." Otherwise we should have asked whether "Verbes at the infinitive" is good or bad English, and whether "pardessus" is really the French for "top hat," as the author suggests. Messrs. W. Cuthbertson and Co., of Edinburgh, are the publishers of the little volume, which will require some revision for the next edition.

THE 14-h.p. Pope Tribune car, for which the Civil Service Motor and Cycle Agency, Ltd., are the British agents, is being fitted with an ingenious design of automatic oiler. The device, being mechanically operated off the engine, does not require any attention on the part of the driver, and it is so made that the flow of oil can be exactly regulated to the requirements of the different bearings, so that the possibility of over-lubrication is entirely avoided. The faster the engine and bearings are running the greater the flow of oil, and when the engine stops the supply of oil also ceases. Furthermore, as the oil is absolutely forced into the bearings, there is no danger of insufficient lubrication.

AN extraordinary attack by five men on Captain C. J. Lynch, of Parkgarraffe House, Monkstown (Ireland), who, with Mrs. Lynch, her sister, and a chauffeur, was motoring near Macroom on Tuesday, is reported. The attack occurred while Captain Lynch was changing the accumulator, and he and the chauffeur were badly beaten. Mrs. Lynch and her sister pulled off some of the assailants, and Captain Lynch rushed to the motor-car and got his revolver, when four of his assailants ran into a house. Three policemen were brought by the chauffeur in the motor-car from Macroom, while Captain Lynch kept guard over the house. Three of the men were arrested, the others having escaped.

## HERE AND THERE.

THE Duke of Connaught was riding in a car hired from the Monmouth Motor Car Company on the occasion of his recent accident.

WE regret to hear of the sudden death of Mr. Graham Notley, of the Waterloo Motor Works, Chicheley Street, London, S.E. The business is, we learn, to be carried on as a limited liability concern, under the management of Mr. Colin Defries.

MR. PERCY LINDLEY'S beautifully illustrated "Summer Holidays" is a cheerful guide to the places of pleasant resort reached by the service of the Great Eastern Railway Company. It is thus a companion to those who tour in the eastern counties, and will be appreciated by a wide circle of readers.

WE are now able to give an illustration of the new Argyll cab which, as stated in our last issue, has just been subjected to a run from Glasgow to London. The vehicle, which has a wheel base of 6 ft. 6 in. and a track of 4 ft. 4 in., is fitted with a 14-16-h.p. Argyll four-cylinder engine, the cylinders being 90 mm. bore by 120 mm. stroke. The cab is geared to twenty-two miles per hour, and on the way from Glasgow an average speed of eighteen miles per hour was maintained. As will be seen from the illustration, the driver's seat is arranged above the

engine; the seat and floor boards can be readily removed to permit of free access to all the mechanism. The cab itself is comfortably seated for four persons and can carry five without inconvenience, while in addition the roof is arranged for luggage. A feature of the upholstery is that the whole of the trimming can be removed to permit the body to be readily cleaned and disinfected, a necessary point in connection with public service vehicles. The cab has been submitted to a London Syndicate, which proposes to test it, and, if found successful, will place a large fleet of these vehicles in service on the London streets.

AT their new depot at 161, Castelnau, Barnes, Messrs. Boon and Porter, in addition to garage work, are now able to carry out all classes of repairs to motor-cars, a number of special machine tools, electrically-driven, having been installed for the purpose. The premises are opened day and night, and a large stock of petrol, greases, motor accessories, and tyres is being kept on hand.

A NEW motor horn or alarm has lately been put on the market by Cairn's Patents, Ltd., of Alderman's House, London, E.C. It is arranged to be operated by means of the foot, and consists of a small pump or bellows located under the footboard and actuated by a small push button; it is so arranged that it can be connected up to any ordinary horn, or is supplied complete; one of its great advantages is that it leaves the driver's hands entirely free.

THE New Century Company has opened a repairing depot for motor-cars at 8, Greville Street, Holborn, E.C.

IN our last issue we briefly referred to a self-acting safety brake for motor-buses which is being introduced by Messrs. Ellis and Taylor, engineers, Southend-on-Sea. We are now able to give an illustration of the arrangement, from which it will be seen that the brake is adapted to act automatically on the tyres of the rear road wheels of a runaway bus or other vehicle. It can also be used by the driver in emergency by slight foot pressure, or by the conductor or other person at the rear of the vehicle by a gentle bell pull, the engine being at the same time stopped by the automatic switching off of the ignition.

Although the device can be arranged to suit any type of vehicle, the illustration shows the design adopted for use on motor-buses in which the transmission is by a cardan shaft. It will be seen that an eccentric A mounted on the latter actuates a pump B, which compresses air into the cylinder C. Between the latter and the plunger, by means of which the brakes are applied, is a tap E that can be opened through the lever D either by pedal by the driver, by a bell push by the conductor, or automatically by a centrifugal governor on the shaft. The governor is so arranged that it can be set to come into action at any speed.

AT the meeting of the London Road Car Company, on Tuesday, Mr. J. H. Moore, the chairman, referred to the smell of the motor-bus as "a new one, to which we had not yet become inured."

AT the concluding meeting of the Engineering Section of the British Association's gathering at York, Mr. Douglas Mackenzie read a paper in condemnation of the usual methods of road making.

A MOTOR ambulance fitted with a 12-14-h.p. Cottureau motor has been supplied by Messrs. Wilson and Stockall, of Bury, to the Purdysburn Fever Hospital at Belfast. It has accommodation for two recumbent patients. The ambulance is fitted with Gaulois tyres.

THE advance in the price of petrol which has lately occurred suggests the necessity of the organisations interested in the automobile movement taking counsel with their members as to the future of the industry. Compared with the rates ruling two years ago the present prices show a considerable increase.

ON Thursday last week the Rykniel Motor Company, Ltd., of Burton-on-Trent, gave a demonstration in Leeds of the braking capacity of their 40-50-h.p. motor-bus, both on the level and on hills. A large party left the Queen's Hotel in the vehicle recently delivered to the Silsden Motor Omnibus Co., Ltd., for a run through some of the heaviest traffic to be found in Leeds, and the ease of manipulation, the rapidity of picking up speeds, and the power of the brakes created a most favourable impression. After lunch, an excursion into the country was made. The route lay along the Headingley Road, and the vehicle climbed the long rise in excellent style. Before reaching Otley the main road was left, and the steep Poole bank descended. All the brakes were tried in turn, and each proved fully capable of holding the heavy vehicle on the steepest gradient. On the return journey, by the Chevin bank, a good impression was caused by the bus surmounting this long pull on top gear at a speed fully up to the legal limit.

AN egg-collecting society in Suffolk intends to adopt the motor-car in its work next year.

A "LONDON MOTOR-BUS GUIDE" has been published by Messrs. Spicer and Co., Southampton Street, Strand, W.C.

UNDER the title of "The Brooke Car of Silent Speed" Messrs. J. W. Brooke and Co. have just issued a catalogue of their new 25-h.p. six-cylinder car.

THE members of the A.C.G.B.I. have been enjoying the hospitality of the Devonshire Club, their own premises in Piccadilly having been closed for cleaning and renovating.

THE Continental Tyre and Rubber Company have issued a 1906 edition of their "Continental Handbook for Motorists." The Gazetteer section seems to be very complete, and the map showing British roads is a useful feature of what has become a standard publication.

THE motor-bus delivered by the Maudslay Motor Company to Sir Marcus Samuel, to which reference was made in a recent issue, is fitted with Continental 930 by 150 mm. round tyres to the front wheels, and the rear pair are shod with 1,035 by 165 mm. steel armoured non-skid tyres of the same make.

AN automobile bridge, stated to be the first of its kind, has recently been erected by the Roswell-Torrance Mail and Passenger Stage line, in New Mexico, to span the Macho, a creek on the route. The bridge is so constructed as to prevent the passage of cattle, consequently there is no floor, the cars crossing by means of narrow tracks like troughs, one on each side.

QUITE a stud of racing cars may be seen at "The Motor House," Euston Road, London, N.W., just now. Included in the display are the 110-h.p. Star that twinkled brilliantly in the Circuit Ardennes; the 90-h.p. monster of the same make whose record boasts fourth place in the Gordon Bennett Eliminating Trials in the Isle of Man; a 90-h.p. Darracq racer, a 60-h.p. Fiat, and a 60-h.p. Mercedes.

A NEW concern—Commercial Cars, Ltd.—has established works at Biscot Road, Luton, for the construction of industrial vehicles. For the present attention is being centred on a chassis to carry either a lorry body of  $3\frac{1}{2}$  tons capacity or a motor-omnibus to carry thirty-six people. The motive power will be supplied by a four-cylinder engine, 115 mm. bore by 140 mm. stroke, which at a speed of 850 revolutions per minute develops over 30-h.p. A feature of the design is found in the change-speed gear-box which has no sliding teeth, the change of gear being accomplished by means of a series of dog clutches, thrown into action by a combination of springs and cams.

A FEW days ago, at the Charing Cross Hotel, W.C., we had an opportunity of inspecting a new radiator for petrol cars which Mr. P. O. Serck is introducing into this country. The feature of the apparatus, which is made by Dr. Zimmermann, of Ludwigshafen-am-Rhein, Germany, is that no brazing or solder-

Illustration showing arrangement of Tubes.

ing is employed in its construction. The cooling tubes, which are circular in section, are arranged horizontally, and are homogeneously attached to cast metal ends. Within the radiator there is a water space of 1 mm. between the tubes, the ends of which are, however, slightly opened out so that they practically abut against each other in the metal pieces. Not only is the radiator claimed to be proof against leakage, but the cooling efficiency, owing to the employment of circular tubes, is stated to be much higher than in the case of hexagonal or square tubes. The water tank, which is combined with the radiator as usual, is also worthy of notice, it being made in one piece and galvanised.

## A NOVEL SPARKING PLUG.

WE illustrate herewith a novel sparking plug known as the "Breech Block," which has lately been introduced by Mr. A. R. Garnett, the successor to the firm of Messrs. Lamb Bros. and Garnett, in place of the "One Year" plug, which enjoys a very favourable reputation in motoring circles. It will be seen that the new plug is constructed on the principle of the breech block of a gun; it is built up of three main parts—the hollow metal base A, which is screwed into the plug-hole in the engine cylinder in the usual way, the breech block B, to which the lever C is rigidly fixed, and the porcelain and central rod F, which is held in place in B by the screwed nut H, no cement being used. The part B of the plug, as will be seen, is not threaded right round, but is divided into three portions, leaving an equal number of plain spaces between them, which have a level coinciding with the bottom of the threads of the screwed portion. The inside of the base A is formed in a similar manner, so that B can slide down into A, and by turning the lever C about a sixth of a turn the threads on B engage with the internal screwed portion D of A, and lock up tight like an ordinary screw. It is claimed that there is no danger of it jarring loose, or of any loss of compression, the joint being capable of withstanding a pressure of 2,000 lb. per square inch. The spark jumps across from the central wire to the side of the plug shell, through which a small hole is drilled, the wire passing centrally through it. A quick detachable wire terminal E is also supplied with the plug, this slipping under a small knob at the top, a spring clip holding it in position. The operation of examining or cleaning the plug is thus rendered

Figs. 1 and 2.—Detail and General Views of Plug.

exceedingly simple, while it can be performed within a few seconds. In fact, one of the claims for the plug is that four of them can be detached, cleaned, and replaced in sixteen seconds. The terminal is first pulled off, then the lever C given a sixth of a turn by the hand, when it and the part B are instantly withdrawn and cleaned. The base A rarely needs removal, and with the central portion taken out may be used for injecting paraffin into the cylinder to clean the walls of the same. The plug is well made, and the ease with which it can be detached should render it equally as popular as the one it has replaced.

## AN INSTANTANEOUS PUMP CONNECTION.

THE accompanying illustrations show the details and also a general view of a new instantaneous pump connection which is being introduced into this country by Mr. H. J. Harding, of 211, Northumberland Park, Tottenham, N. The device, which is known as the "Eclair," is of French manufacture, and is designed to do away with the troublesome work of screwing on the ordinary pump connection to the tyre valve, and also of carrying adaptors where tyres not having the standard form of valve are used, the attachment being made instantly to any valve by pushing the connector on to the stem, from which it

Figs. 1 to 5.—Detail and General Views of Pump Connection.

can just as readily be removed. Referring to the illustrations, it will be seen that it consists of a bell-shaped piece, 2, one end of which is adapted to be fixed in the rubber tubing of the pump, the other forming an air chamber, in which is placed a rubber washer, 3. The latter, which is held in place by the looking rings 1 and 4, is of a special shape, having two inturned lips, the inner one of which is pushed over the valve stem. It will be seen that when the pressure from the pump reaches the air chamber it instantly makes the valve connection perfectly airtight by means of the inner rubber lip being held, by the pressure, firmly round the valve; and also, for the same reason, the outer lips on the rubber washer prevent any air escaping at the joint. The only part subject to wear is the washer, which, after the pump has been used from 4,000 to 5,000 times, may require to be renewed, an operation which can be performed in less than half a minute and at the cost of a few pence. We may add that the connection is made in two sizes—one for motor-car tyres, and the other for bicycles and motor-cycles.

THE West Suffolk County Council is making application for a L.G.B. regulation limiting the speed of motor-cars to ten miles an hour over certain roads within the urban district of Newmarket. Objections should be made to the Clerk to the County Council by the 23rd inst.

MR. W. POYNTER ADAMS has written a book on "Motor-car Mechanism and Management," dealing with the petrol vehicle. Later volumes will treat of the electrical and the steam vehicle respectively. The elementary sections of the subject are dealt with in an extremely comprehensive style, which has the merit of clearness. When treating of gears, Mr. Adams might have usefully included diagrams in his excellent treatise, which contains a glossary of terms with well-condensed definitions, in which accuracy has not been sacrificed, as is too often the case, in such efforts of securing *multum in parvo*. Messrs. Charles Griffin and Co., Ltd., are the publishers.

## CORRESPONDENCE

Letters to the Editor should be addressed to the offices,  
87-88, Charing Cross Road, W.C.]

### THE REPORT OF THE ROYAL COMMISSION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to Mr. W. Bentley's letter in the last issue of the *M.C.J.*, I should like to say that I am quite in sympathy with him in his views as to the proposed taxation of motors. I go further than he does, however, and consider that if this proposal is carried out it is nothing short of rank injustice and further persecution of the motorists, and one of the greatest blows struck at motoring generally since the passing of the Act. I am certain that it will cause hundreds of persons with limited incomes, who now keep cars, to give up doing so.

We motorists are at present taxed much more heavily than is just, comparing us with other users of the roads. That all taxes upon motors should be spent on the roads is quite right, and what we have all been asking for for years, but that we, who do no damage to the roads, should be taxed in this vindictive manner while the owners of horses and iron-tired vehicles, the real destroyers of roads, should get off practically scot free, is utterly unreasonable. If road users are to be taxed to keep the roads in order, by all means let them all pay their fair share, which in justice should be 50 per cent. more in the case of horse-drawn and iron-tired vehicle owners than that of the motorists with their expensive rubber tyres.

I can only hope that we motorists are now numerically strong enough to successfully oppose such a one-sided suggestion from becoming law.—Yours truly,

J. BRYANT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I think that the tax proposed for motor-cycles is too heavy, especially when the annual expense of the driving licence and registration fee is taken into account. Now that such machines can be picked up cheap for a few pounds, the suggested taxes will fall heavily on the working man, and I think it would be good policy to try to get the Labour Members of Parliament to see this. I do not see any reason why an effort should not be made to get motor-cycles exempted, so that no registration or driving licence would be necessary in their case, as they do not travel very fast, like large cars. At any rate they ought to be exempt from all taxes, and only bear the cost of registration and drivers' licences, as they do not throw up much dust, so as to require roads to be tarred for them. If a tax must be imposed, let it be a lump sum, like the playing card tax, and not a troublesome annual tax. Could not this principle be applied to all carriages alike?—Yours truly,

CECIL JACKSON.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We wish to direct your attention to what we consider is a very glaring omission in the report and recommendations of the Royal Commission on Motor Cars. That is the entire absence of any reference to or provision for danger boarding and warning boarding the roads of the country. Quite apart from the fact that if the speed limit is removed there will be an absolute necessity for some scheme of the sort, the decay into which the very valuable series of danger and caution boards erected throughout the kingdom by the joint efforts of the C.T.C. and N.C.U. (and at the expense of these bodies) have fallen is a serious danger, not merely to motorists and cyclists, but to the entire public. Some time since those bodies decided that the time had arrived when the onus of safeguarding the roads in this particular fell upon the road authorities, as it was a public duty, and they appealed to the various district and county councils to take over and maintain the boards which they had erected. How that appeal had been answered the dilapidated and useless condition of these warnings show. Is it too much to ask that both the cycling and motoring authorities should combine at the present moment to have this serious defect remedied in any legislative result of the Royal Commission on Motor Cars?—Yours truly,

THE BOWDEN BRAKE CO.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice the letter of Mr. Bentley in the last issue of the *M.C.J.* re the Motor Commissioners' recommendations, and entirely agree with him that the proposed taxation of cars is much too heavy, and will especially hit hard the man of moderate means. If you take the case of a man who wants a moderate-speeded car, to take his wife and one or two children out, he must have a four-seater, which would either bring him in for the £5 5s. tax, or, if cars were lessened in weight to bring them in for a lower tax, they would probably be scamped and lead to accidents. Mr. Bentley's proposal is quite sufficiently heavy.

The Commissioners' suggestion that rear lights should not be required

except to light the rear number, and that no other vehicles need show rear lights, is also a great mistake; if we are to minimise accidents in the future, it is absolutely necessary that all vehicles, without any exception, should show a red light to the rear, and I feel sure that if the Commissioners would try riding in a car on a dark night along narrow and tortuous highways, and with many other vehicles about, they would be the first to recognise the absolute necessity of rear lights to all vehicles, if accidents are to be avoided.—Yours truly,

G. S. P.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The feeling in Lincolnshire re the Royal Commission report seems to be that it is on the whole good. Owners of medium-sized cars, such as 10-12-h.p., object strongly to the proposed increase of tax. Medical men especially say that it would entail great hardships on them; many about here have two cars, and an increase from £4 up to £10 or £12 is a serious matter. They hope, however, that some alteration or abatement may be made in their case. The abolition of the speed limit is universally applauded, though we have had no trouble with that hereabouts.—Yours truly,

GODFREY LOWE.

### A STEAM CAR CHALLENGE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I understand that the reason Mr. Edge has declined to accept my challenge is his fear that he would break the law by so doing. I note that he suggests that the match be decided in the Graphic Trophy contest, if the permission of the Automobile Club can

A motor-vehicle service has lately been started in Swaledale for the conveyance of passengers and the mails between Reeth, Richmond and Darlington. Our illustration shows one of the cars at the Post Office at Richmond, Yorks.

be obtained. I think the simplest way to obtain this will be for him to enter the car which I have already specified in the contest for the Graphic Trophy, and if the Graphic Trophy is to be run for over a course which I consider a good hill climb, I shall certainly enter my 18-h.p. White car. If he enters the 60-h.p. car which I have specified, and I run my car in the Graphic Trophy contest, I shall be willing to match my car against his for £100 a side. So much for that contest. With reference to the Mont Ventoux Hill Climb, I do not care to enter into a competition against racing cars, for my car is a *bona fide* touring car.

Mr. Edge says in his letter that he wants to "compare the price list" of my car "with what actually does take place in practice." What it actually does in practice as to the accumulation of high steam pressures is an amplification and justification of the statements in the price list description of the White generator, in the sense that what I have done in that particular with my car in hill climbs can be done with any other White steam car in the country, whether it is of 18-h.p. or 15-h.p., for that matter.

Mr. Edge is correct in stating that the engine is a compound engine with a 3 in. bore high-pressure cylinder, and a 5 in. bore low-pressure cylinder with a stroke of  $1\frac{3}{4}$  in. I know no 18-h.p. White steam car which has different engine dimensions than those quoted. They are certainly the dimensions of the engine in my own car. To state that at a steam pressure of 400 lbs. and at 400 revolutions the engine indicates 23-h.p. is very misleading, as the temperature of the steam must also be taken into consideration. Where Mr. Edge falls into conspicuous error, however, is in saying that my engine was worked as a simple engine in the recent hill-climbing competitions. Anyone who knows anything about the White steam car knows that the only reason the engine is ever made a simple one is to assure

ts not being on centre in starting. As soon as the engine is actually turning the starting pedal is released and the engine becomes compounded. To try to climb a hill on a simple engine would be suicidal as far as obtaining speed is concerned. The White generator is not constructed in such a way that it could feed two high pressure cylinders with sufficient steam to keep the car moving at a good speed more than a comparatively few number of yards. In other words, Mr. Edge attempts to make out that I use my engine as a simple engine in hill climbs and thus double its horse power. The fact is, as all who are familiar with the White cars know, I do not use it as a simple engine except to start from a standing position, just as I do each and every time the car is started from a standing position. Mr. Edge's exaggerated figures of 50-h.p. and 150-h.p. are indicative of a most comprehensive and well-developed imagination.

In my opinion, to start an ordinary touring car, well loaded, at the bottom of a steep hill, move it from a standing position just as fast as one can move it, and rush it all the way up the hill is not running a car under ordinary touring conditions. Does Mr. Edge argue that racing a petrol engine at the start of a hill climb to such an extent that one cannot hear oneself think is starting a car under ordinary touring conditions? No hill climbing event which I ever have seen required that one should run his car under ordinary touring conditions, but merely required that his car should be an ordinary touring car.

The 18-h.p. White car which Mr. Edge wants to dub a 150-h.p. vehicle can very easily be made to show 1,200 lbs. on the steam gauge by intentional manipulation of fire and water. When I say this I mean that

Mr. Thomas Lawrance, of Haccenby Hall, near Bourne, who is only a couple of years off being a centenarian, took his first ride in a motor-car the other day. He has since been taken for several spins by his nephew on a 16-h.p. Panhard, and enjoys motoring immensely. Mr. Lawrance is a cousin of Mr. Justice Lawrance, and at one time was largely connected with public affairs in Lincolnshire.

any 18-h.p. White car can be made to do this. I see no reason why any car which has this capability should not be allowed to exercise it in case it wishes to start from a standing position at high speed. Mr. Edge says that a vehicle which enables one to store up power and use it practically like an explosive for starting purposes is not running under *bona fide* conditions. I consider that he is all wrong unless his definition of *bona fide* conditions would be such that no White car can start under any conditions which could not be attained by a Napier car.

When Mr. Edge advises me to declare the actual horse-power of my car, my mind goes back to the 20-h.p. Napier in the Bexhill races of not many years ago. When it suited Mr. Edge's book to declare low horse-power and defeat cars of higher-horse power, I had occasion to ask him personally his views on the subject. He most ably defended the practice of declaring his higher-powered car as 20-h.p. at that time. Mr. Edge has invited the suggestion that when the shoe is on the other foot his opinions change. Has the fact that his higher-powered cars are to-day beaten by cars of lower declared h.p. been one of the chief factors in making him change his mind?

Mr. Edge states that I should be ashamed of using my engine under such conditions as to cause it to break down. This, from a gentleman of his experience with motor breakages in prominent motor competitions, appals one when one ponders over the amount of contumely which he must have heaped upon himself during the years of his connection with the motor movement.

Finally, I revert to the statement made in the early part of this

letter with reference to the Graphic Trophy. If Mr. Edge does not care to race me up Porlock Hill, and the Graphic Trophy is held on a course which is a sufficient hill-climb to allow me a fair advantage over a car which I recognise to be much faster on the level than my own car, let us enter our respective cars, put up our £100 each, and abide by the result of the competition.

I proposed the match purely on account of Mr. Edge's statement to the effect that my car could not maintain its speed for other than a very short distance. That is really the bone of contention, and to that question he has avoided any reference in his letter answering my challenge.—Yours truly,

FREDERIC COLEMAN

### WHY IS A SILENCER NECESSARY?

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to "Enquirer's" letter regarding the elimination of silencers, in the *M.C.J.* of the 11th inst., the advantage of greater expansion of a given charge, and most of the other advantages of the special forms of expansion engine, can be obtained by using a motor of somewhat greater capacity than would ordinarily be required, designed with a rather small clearance space but otherwise on ordinary lines, and running it well throttled down. This is practically what is done with a certain make of motor-cycle. The machine is fitted with an exhaust cut-out which can readily be opened or closed while riding. I find when riding along a good level road, with the motor well throttled but with the spark advanced, that upon opening the silencer cut-out I notice no increase in the noise of the exhaust, nor, on the other hand, do I notice any increase in speed. This proves, to my mind, that under these circumstances of expansive working, while the silencer does no good, it also does no harm, so it is just as well to let it remain on the machine. This method of securing greater expansion of the charge with an engine of the ordinary type has the advantage over the specially-designed expansion motor that one may, in case of necessity, utilise the entire capacity of the engine as in starting, hill climbing, &c. However, if this form of motor is designed to get the best results from the expansion of the charge, it will be found that, when running at its full capacity, the compression will be somewhat excessive and that the motor will show signs of overheating, if run on full throttle for very long. Under these circumstances, of course, a silencer would be found quite desirable at times.—Yours truly,

R. WORTHINGTON.

### A SMALL CAR OWNER'S EXPERIENCE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As an example of what an old-fashioned car will do if well looked after, the following may be interesting to some of your readers. The car is an old style single-cylinder Wolseley, rated at 5-h.p., 760 by 90 Michelin tyres on front wheels, 2½ in. Sirdar solids at rear. Although the car is nominally a three-seater, the load on the trip outlined below comprised myself, my better half, three children, our Skye terrier, and a large hold-all. Left Somersetshire July 31st, first night put up at Birmingham, second Sheffield, third arrived Scarborough. Ran a little in advance of our time table all the way; two involuntary stops, the first due to a leaky join in tube of front tyre, second to old patch breaking out afresh. No punctures. Timed car on level stretches several times when travelling at its best, and found it doing the miles almost exactly three minutes every time. Petrol carefully noted all through, result thirty-three miles to the gallon. Always drove down hill declutched and braking with engine where possible.

Car has run over 20,000 miles now, has worn out two sets of solid tyres and has had one new sliding-gear sleeve. Upkeep is wonderfully small; indeed, if it were not, I could not afford to keep a car.

I am not interested in the motor trade in any way, nor in the Wolseley Company, and, in fact, do not think I should have another Wolseley, as my old "Warhorse" is somewhat noisy. We all feel, however, that we would not part with our old servant unless to a kind home, as the dog advertisements say. I am a civil engineer, and take a keen interest in my machine, and try as far as possible to anticipate its wants before it makes them known.—Yours truly,

Y 35.

### THE ARMY MOTOR RESERVE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—An Army order has recently been promulgated which disbands the Motor Volunteer Corps and substitutes, in its place, an Army Motor Reserve, composed entirely of officers. The Motor Volunteer Corps, after three years' hard trial, has proved beyond dispute both the utility and necessity of a Motor Corps as a unit of His Majesty's Forces, but certain points in its constitution rendered it expedient that some changes should be made. The corps had only an establishment of forty-five officers, and an apparent disinclination on the part of owners of suitable cars to be enrolled as "privates" was noticed, whilst the fact that the Volunteer Act is inapplicable to Ireland prevented the recruiting of members in that part of the kingdom. With a view to removing these obstacles, I suggested to the Army Council that the change now announced should be approved.

There has been no failure on the part of the Motor Volunteer Corps to render itself of the greatest use to the country, whilst the enthusiasm

and energy displayed by its members have been at all times most conspicuous, and have always earned the highest praise from the military authorities. In reality, therefore, there is merely to be a reconstruction of the corps. Nothing is being destroyed, and the first Motor corps ever formed in any army is now placed on a sounder basis, with the object of still further increasing its great usefulness. The constantly growing demands on the resources of the corps have, however, now rendered it essential that an effort should at once be made to augment its numerical strength. It is in this direction that I venture to solicit the assistance of your valuable paper, and to appeal, through your columns, to the patriotism of my countrymen. There are a great number of motorists in the United Kingdom who have ample time at their disposal, and who, I feel sure, will readily respond to an appeal to render some service to their country. The fact that such an excellent opportunity now exists cannot, however, be more successfully brought to their notice than through the medium of your journal.

I may, perhaps, be permitted to state briefly the leading points connected with the Army Motor Reserve. Gentlemen will be given commissions in the regular forces and be passed to the reserve of officers. Their duty is entirely in connection with the staff of the Army, and, though this duty is of a most responsible nature, it is at the same time most pleasant and interesting and by no means arduous, being limited, in time of peace, to six days' compulsory duty annually, though fifty-six days may be performed voluntarily. Allowances are made at the following rates:—Daily allowance, 30s.; allowance for each night necessarily detained from home 12s. 6d., and 4d. per mile petrol allowance. In time of national emergency officers of the Army Motor Reserve, called to army service, will receive special rates of pay and allowances. The provision of a service dress, costing about seven guineas, is the only requirement as regards uniform, and the annual subscription is small. A thoroughly efficient car and a practical knowledge of it are two essential conditions, while a knowledge of military matters is not at all necessary. Compulsory retirement does not take place until the age of sixty. The headquarters of the corps are at 29, Sackville Street, Piccadilly, W., where there is also a spacious club-room for the use of officers. Gentlemen owning motor-cars and desiring to apply for commissions in the Army Motor Reserve are asked to send their names, particulars of their cars, experience, &c., to me at the above address. Apologising for the length of this letter and thanking you in anticipation for the courtesy of its insertion,—Yours truly,

MARK MAYHEW.

Lieutenant Colonel  
Commanding the Motor Volunteer Corps.

### THE MOTOR YACHT CLUB TRIALS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be obliged if you would allow me to explain, through the medium of your Journal, the reasons why Scout III. and IV. failed to be in the No. 4 dock, Southampton, on the evening of July 31st by 8 o'clock, and were consequently disqualified from the above trials by the Committee, who stuck fast to the rules they laid down. I should like to see other club committees take the same course and abide by the rules they lay down, then motor competitions of the day would be worth entering for. Referring to the two "Scout" boats, the engines of which were running well on the day before the trials, they failed to be in the dock by the appointed time owing to Mr. Silk, who was in charge of Scout III., having taken the boat over to Cowes during the afternoon of July 31st, for its spray hood in case of bad weather during the trials. On his return journey the reversing propeller broke near Calshot, and consequently he was unable to repair same in time to enter the dock by the appointed hour. The same evening Mr. Burden, who was in charge of Scout IV., misread the rules, thinking it was nine instead of 8 o'clock that the boats had to be in the No. 4 dock. On entering at 8.10 p.m. he was somewhat surprised to learn that he was disqualified. I immediately entered for a long distance trial over the same course under the official observation of the Motor Yacht Club, which takes place this week.—Yours truly,

J. PERCY DEAN.

### BRAKES FOR MOTOR-BUSES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read the letters in recent issues of the *M.C.J.* with interest, and would like to point out that in the 40-h.p. Brotherhood car, the designs for which were got out twelve months ago, both hand and foot brakes operate on the rear road wheels. The arrangement we have is that the foot brake is of the internal expanding type, whilst the hand brake is of the external contracting type. In actual use on the road with this car, I have found this braking system to be a great improvement on the popular type, where the foot brake is fitted somewhere on a driving shaft, and it has the advantage that nothing short of the collapse or breaking of the road wheel itself can put the brakes out of action, whereas in the popular method of arranging the foot brake, should either of the chains break or the cardan shaft give way, the foot brake is immediately rendered useless, whilst at all times, when it is employed, it is putting an unnecessary strain on the driving gear, which is put there to transmit the power only to the road wheels and should not be subjected to braking strains.—Yours truly,

PERCY RICHARDSON.

### A CAR FOR DOCTOR'S USE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am a medical practitioner, and have worked my practice during the past five years by means of petrol cars. I find the noise made by the engine a great drawback, as I have not been able to afford one of the latest four-cylinder cars in which noise is reduced to a minimum. I thought of trying a steam car, say a White or Gardner-Serpollet. Can any of your readers give me any information as regards the cost of running as compared with petrol cars of same horse-power? I have always driven my cars myself, and should like to know if steamers are difficult to drive and if the mechanism is complicated.—Yours truly,

OLIVER SMITHSON.

### HOW ACCIDENTS OCCUR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—During a visit to Sandbanks, between Bournemouth and Poole, I noticed a motor-bus, E.L. 316, running with the near side hind wheel in a very shaky condition. The hub of the wheel was working in the spokes to the extent of three-eighths of an inch, and all the bolts were loose enough to tighten by the thumb and finger. I called the driver's attention to the fact, but the only remark was that it had been running for the past four days in that condition, and it was all right so long as it got no worse. To make matters worse, both of the side brakes were

Alderman T. Scott Foster, of Southsea, on his Daimler Car.

disconnected, so only leaving the foot brake for action. As there are several sharp hills to be travelled in doing this journey, I consider this vehicle running in the condition I saw it to be a source of danger to the general public, even if not plying for hire. What I should like to know is, who is responsible for this gross negligence, the owner or the driver?—Yours truly,

H. J. TAYLOR.

### EXPLOSION AND EXHAUST PRESSURE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As an earnest reader of your valuable paper, I would like to ask a question to which I trust you or some kind motorist will be so good as to give me an answer. What is the pressure per square inch at the explosion of petrol on the piston; also the pressure per square inch of the exhaust gas at the cylinder before entering the silencer?—Yours truly,

EXHAUST.

[The pressure per square inch at the explosion is approximately three times that of compression, which decreases from 2 to 3 lbs. per square inch before entering silencer, in the exhaust.]

FOUND.—A large hub cap on the Bath road, between Theale and Aldermaston, on Tuesday, the 7th inst. Owner can have same on application to Mr. E. P. Stephens, Taplow Priory, Bucks.

MESSRS. FRISWELL, LTD., ask us to warn motorists against drivers who allege connection with their firm without being able to prove *bona fides*.

## FROM GLASGOW TO LONDON BY MOTOR-CAB.

BY E. H. WATSON.

"It doesn't always rain in Scotland—sometimes it snaws," sapiently quoth one of the Argyll Alexandrians as he drove myself and party round the lovely lake of Lomond on Bank Holiday. We were in "bonny Scotland" to attend the trial of the first all-British four-seated motor-cab ever built, and, as the run was to be from Glasgow to London, we were naturally anxious for kindly weather. Fortunately the pessimism of our friend was not supported by fact, for the start was eventually made from the Queen's Hotel, Helensburgh, in sunshine typically tropical.

It may be well to consider what must be the chief characteristics of a British-built motor-cab if it is to make a bold bid for public favour in this country. Primarily, it must be reasonably priced. It must be roomier than the doomed "growler"; it must be smart in appearance and small enough to take up less space than a horse-drawn vehicle; it must be of sufficient power to tackle the most vicious hills, yet to all intents and purposes it must have sufficient flexibility of engine to drive on the top speed whether on long, stiff gradients, or in traffic when a walking pace becomes a necessity. The new Argyll cab which has been designed to meet these requirements is arranged with the engine underneath the driver's seat and footboard. The motor is the standard 14-16-h.p. Argyll, having a bore of 90 mm.

kept. Another advantage it possesses is that when reversing the driver can see behind him. Every sanitary precaution has been taken in designing the interior. The upholstery is detachable, so that it can be taken out and thoroughly cleansed at any moment. By means of a speaking tube, the occupants can communicate with the driver, beside whom is also a seat for a footman or fifth passenger.

The 400 mile journey from Glasgow to London was no light task; we had an untried vehicle, and there were four heavy passengers besides the driver and much impedimenta; in fact, the cab when loaded scaled 37 cwt. Imagine setting out for the far south under such conditions in an ordinary one-horse "growler." Right from the start the run was as successful as we could have wished in our most sanguine moments. We found the cab attained a speed of about 20 miles an hour, and was most comfortable to ride in. Notwithstanding the flexibility of the engine, we did not hope to make the through run without changing speed, but we tried to get as far as Kendal on our "top," and succeeded. Considering our total weight, I think this was a performance to be proud of. When we began the long, wearying ascent of the celebrated Shap Fell, we knew that we were asking the utmost of our sturdy little engine. Without so much as a falter, however, the cab climbed the last gradient to the apex of the moorland height, and we could not resist sending up a cheer of satisfaction. Not only were we the first motor-cab to undertake so long a journey, but in all probability we were the first to mount the Shap.

From Glasgow to London we only changed to our second speed

The Argyll Cab passing through Stamford.

and a stroke of 120 mm. The inlet and exhaust valves are placed on the opposite sides of the cylinders, the latter being cast separately. Ignition is by means of battery and coil, the latter being placed on the dashboard and easily accessible. The normal speed of the engine is 1,100 revolutions per minute, and it develops a maximum of 18 brake h.p. An exceptionally large radiator is fitted, the water circulation being maintained by means of a centrifugal pump. The whole of the gearing for driving the two half time shafts, the pump and the commutator is enclosed in a grease-tight case at the front of the engine. The lubrication of the latter is on the splash system, a sight feed lubricator being placed on the dashboard immediately in front of the driver. The gear-box is exactly similar to that used on all Argyll vehicles, and is of the well-known Govan type, giving three speeds forward and a reverse. The clutch is of the multiple disc type, and the transmission is by means of live axle, the power being conveyed to the latter from the gear-box by a special universal joint. 815 mm. by 105 mm. tyres are fitted, those on the rear wheels being provided with non-skid bands. The body has comfortable inside accommodation for four passengers, or, in fact, for five on an emergency. Ample provision is made for the conveyance of luggage on the roof, while in the interior of the cab there is ample space underneath the front seat for the carrying of a number of small parcels. The weight of the cab complete with equipment, tools, &c., and fully charged with water and battery, is 26 cwt. The engine being beneath the driver's seat, the 3 ft. 6 in. of bonnet space is saved, and this makes the cab so handy that it can be garaged in any building where an ordinary horse-drawn vehicle has been

twice. We drove on top from twenty miles an hour in the open country to four in the jostling traffic of Oxford Street. Once we got on to our second down a particularly vicious hill, and found the cab under perfect control without the use of brakes. And so, to cut a long story short, we travelled from Glasgow to London by motor-cab. We did not hurry, but took many interesting photos *en route*, and rambled around such quaint old-world towns as Carlisle, Kendal, and Stamford. Neither tyre nor mechanical troubles marred the pleasure of the excursion, and we got home to Newman Street, W., thoroughly satisfied with our run, our cab, and ourselves.

## CLAIMS AGAINST MOTORISTS.

As the result of a collision between a motor-car and a market-gardener's horse and van, near Botley (Hants) on the night of June 22nd, Dr. March, of Amesbury (Wilts), has been ordered to pay £29 damages to the owner of the horse, the animal having to be destroyed in consequence of the accident. In giving judgment, Judge Gye said that it was a legal injury which had not been proved, but his Honour said he would take the first opportunity of proving that it was. He granted costs on scale "C," and allowed extra solicitor's fee, "because it was a case of public importance, and he never lost an opportunity of impressing upon motorists the necessity of the greatest care and caution in driving a dangerous machine."

## CLUBS AND ASSOCIATIONS.

### MIDLAND.

THE following gentlemen have been elected members of this Club:—Messrs. James C. Bent, Edgbaston; Philip Graham, King's Lynn; Frank J. Hughes, Edgbaston; Arthur Pilkington, Wyde Green; J. McGlashan, M.D., Redworth; Leo Myers, Edgbaston; Norman Tailby, Edgbaston; Thos. Barclay, J.P., Bromsgrove; and Joseph Freedman, Birmingham.

The following are candidates for election:—Messrs. Arthur Oliver Holbeche, Great Malvern; William John Whiting, Handsworth; Christopher Bryant, Small Heath.

The consumption trial and brake, smoke, appearance, silence, and vibration tests organised by the club are to be held on Saturday, the 25th inst.

### KENT.

MEMBERS of the Kent Automobile Club are reminded of the invitation of the president, Sir David Salomons, Bart., to Broomhill, Tunbridge Wells, for to-day (Saturday), when the prizes won at the recent hill-climb and gymkhana will be presented.

The 12-14-h.p. Aster-Teco Car recently completed by the Thornton Engineering Company, Bradford, for a local motorist. As will be seen, the body, which was designed by the owner, is a two-seater and is fitted with wind screen and Cape cart hood.

### BERKSHIRE AUTOMOBILE CLUB.

THE concluding summer meeting of the Berkshire Automobile Club was held on the 7th inst. at Greenham Lodge, Newbury, when Mr. and Mrs. Lloyd H. Baxendale were at home to members of the club and their friends. Greenham is situated at the western end of Crookham Common, about 400 feet above sea level, and commands a magnificent view of the surrounding country, including the adjacent Newbury racecourse, to the successful establishment of which Mr. Baxendale's efforts and support have so largely contributed. During the course of the afternoon an informal gymkhana was held, but, owing to the attractions of the beautiful grounds, gardens and vineries, the events were cut down to only three. A novelty was introduced in the shape of two races for chauffeurs, and this feature proved to be greatly appreciated. Eight competitors started in the lady passenger race, these being:—the Rev. J. D. Ouvry (15-h.p. Darracq); Mr. Sydney a Court (14-h.p. Renault); Mr. C. D. Leng (18-h.p. White steam car); Mr. E. P. Stephens (7-h.p. Panhard); Mr. C. H. Dodd (8-h.p. Renault); Mr. D. D. Coath (15-h.p. Panhard); Dr. J. Hopkins Walters (15-h.p. Darracq); and Mr. Haviland (8-h.p. Cadillac). After an exciting series of heats, the Rev. J. D. Ouvry proved the winner, with Mr. E. P. Stephens a good second. The potato race was won by Mr. G. B. Tydd's driver (24-h.p. Richard-Brasier), with Mr. C. H. Dodd's driver second. Other competitors in this race were Mr. A. Wombwell's driver (24-h.p. Delahaye); Mr. J. F. Hawkins' driver (16-h.p. Clement); Captain J. T. Wigan's driver; and Mr. E. P. Stephens' driver. The race was twice round the course, with eight potatoes, four flower-pots being arranged close to the line of spectators. The glass of

water competition, in which each of three passengers had to carry a full glass of water during one round of the course, was won by Mr. C. H. Dodd's driver, with Mr. G. B. Tydd's driver second. The passengers in the winning car lost no water at all, and covered the 300 yards in 1 min. 22 sec., whilst the greatest loss of water was 2.16 oz. The other competitors in the race were:—Mr. J. F. Hawkins' driver; Mr. E. P. Stephens' driver; Captain J. T. Wigan's driver; and Mr. A. Wombwell's driver.

The races were arranged round the cricket field, as close as was permissible to the pitch, the total length being exactly 300 yards, and the course was indicated by a central white line, which turned off at the finishing point to give the competitors a clear run out. Mr. Baxendale officiated as starter, with Mr. C. R. De la Salle, Mr. Sidney a Court, Captain W. Waring, and Mr. Shrapnell Smith as stewards.

### DERBY.

It is satisfactory to note that the Derby and District Automobile Club have been enabled, as a result of their gymkhana at Burton-on-Trent on July 14th last, in aid of the Mayor of Burton's Distress Fund, to hand over the substantial sum of £25 8s. 2d. to the Mayor. The officials responsible for the arrangements are to be congratulated on the success attending their efforts in the first gymkhana held under the auspices of the club, particular credit being due to Mr. L. P. Mell, the Burton representative on the committee, for his invaluable assistance. It is hoped to repeat the function next year on a much larger scale in connection with all the Midland clubs.

### IRISH.

THE programme of events for the motor-car gymkhana to be held on Tuesday, the 28th inst., by the Irish Automobile Club has been arranged: it will consist of the following events:—Bending Race. Ball and Bucket Race. Balloon Competition. Glass of Water Race. Victoria Cross Competition. Gretna Green Race. Tortoise Race. General Appearance Competition. These last two events will be held should time permit. Full particulars and entry forms are being sent to members, and those whose intention it is to compete in all or any of the events should send in entry forms without delay, as entries at single fees close on the 21st inst.

### YORKSHIRE.

A PROVISIONAL arrangement has been made whereby the headquarters of the Yorkshire Automobile Club (in consequence of the fire at the Great Northern Hotel) will now be at the Hotel Metropole, Leeds, Room No. 40. A general meeting of the club will be held on the 20th inst. for the purpose of confirming the affiliation of the Barnsley Automobile Club. Arrangements are being made for an inter-club meet with all the branches, at Ripon, on the 15th prox.

### NEWCASTLE M.C.C.

SEVENTEEN members of the Newcastle Motor Cycling Club had a journey from the Tyneside city to Edinburgh and back on the 12th inst. The outward route was by way of Morpeth, Alnwick, and Berwick, returning via Lauder, Jedburgh and Otterburn. The leaders, making excellent time, reached Newcastle in the following order:—Messrs. G. W. Raper, G. Rickard, J. Feather, R. Atkinson, J. N. Gray, A. D. Nicholson, V. Corbett, L. Rosenvinge, J. Lucas, S. W. Carty. Hart and Mills fell out at Edinburgh, Parkin at Berwick, Elliot at Jedburgh, Smith at Earlstown, and Garbutt at Dunbar. The judges' car—an 18-22-h.p. Sanderson-Aster—under the control of Wm. Bracewell, a driver in the Paris-Madrid race, rendered invaluable assistance to the judges, and also to competitors rendered *hors de combat*. The failures of the trial were considered solely attributable to the very adverse conditions met with, the rain rendering belt troubles more frequent than any other, while, though on the whole the roads were excellent, the surfaces throughout were most treacherous. Mr. G. W. Raper will be awarded a cup as winner of the event.

### AUTO CYCLE CLUB.

DURING this season there have been several hill-climbing competitions for motor-cycles, but what should be the most important and interesting will no doubt be that which the Auto Cycle Club is promoting up Birdlip Hill, near Gloucester, on Saturday, September 8th next. This famous hill is one of the steepest to be found in England, and the length of the course which will be used on this occasion is 1 mile 140 yards. In this distance there is a rise of 700 feet, the average gradient over all being 1 in 8. The competitors in the Auto Cycle Club's trials in 1905 had to climb this hill in the course of their second day's run, and the fact that only two out of the thirty motor-bicycles that started on that day succeeded in climbing the hill without being assisted by pedalling, whilst others failed altogether, will show the severity of the gradient.

### PUBLIC MOTOR SERVICES.

THE Clacton-on-Sea Motor Omnibus Co., Ltd., having applied for licences for two motor-coaches, the Highways Committee of the Urban Council recommended that the licences be granted. At the meeting of the Council Mr. John James moved that the recommendation be struck out. In his opinion motor-buses were abominable nuisances and

unnecessary, for people did not visit Clacton to ride on them. Mr. A. E. Doubleday seconded. He said it might not seem hardly fair to grant licences to the G.E.R. and refuse them to a private company, but they could not help themselves in regard to the G.E.R., although he thought that the town would be better without them. Eventually the licences were granted, subject to the buses being approved by the Council.

A MOTOR char-a-banc service has been started from Knott End to Lancaster in connection with the Blackpool tramway service.

THE Worthing Town Council are recommended by the General Purposes Committee to direct that every person applying for a licence as a motor-car driver shall be required to submit a certificate of efficiency from the Automobile Club or other Association of equal authority and standing. The Brighton, Hove, and Preston United Omnibus Company have notified their acceptance of the terms and conditions imposed with respect to licences for motor-omnibuses running between Worthing and Brighton. The Council have now been recommended by the Committee concerned to grant two additional motor-bus licences, permission to be given for such omnibuses to run, in addition to the three previously licensed for Bank Holidays and other special occasions when the traffic is heavy.

A MOTOR-OMNIBUS service has been established between Angel Road, Edmonton, and Waltham Cross.

THE directors of the London Road Car Co., Ltd., have reported that their revenue has suffered from the low earnings of the horse-drawn buses and the competition of motor-buses.

THE Commissioner of Police has placed policemen in plain clothes along Edgware Road, W., to check the motor-bus racing that is alleged to take place in that busy thoroughfare.

At Willesdon three motor-bus drivers have been fined 20s. and costs for reckless driving; seven others 5s. to 20s. each at Kilburn; and four at Marylebone from 20s. to 40s. for driving to the common danger in Chalk Farm and Forbes roads; fourteen summonses have been issued against motor-bus drivers at the Westminster Court.

SOMETHING of an innovation with regard to the public control of motor services is suggested by a resolution of the Watch Committee of the Southport Corporation, which declares that "the fare to be charged by the owners of motor-cars for the circuit of the Marine Drive should be fixed at 3d. per head." Usually the fare charged has been sixpence.

THE motor-omnibus service between Hasland and Chesterfield, inaugurated by Mr. C. P. Markham, J.P., has commenced running, and has been well patronised during the week.

### THE BRITISH INTERNATIONAL MOTOR-BOAT RACE.

ON Wednesday of last week the eliminating trial to select the team of three British motor-boats to compete for the British International Cup presented by Baron Northcliffe was held in Southampton Water, resulting in the victory of the following boats:—

Boat.	Owner.	Helmsman.	Total time five laps. h. m. s.
1. Yarrow Napier ..	Lord Montagu ..	Lord Montagu ..	1 29 37
2. Rose en Soleil ..	Lord H. de Walden ..	Mr. Fentiman ..	2 1 47
3. Daimler I. ..	Lord H. de Walden ..	Lord H. de Walden ..	2 15 36

The race for the British International Cup on the following day was robbed of its international character by the non-appearance of Dixie, the boat with which the Motor Boat Club of America had challenged. An Italian F.I.A.T. had been notified by telegraph on July 31st, but as that date was about a month after the closing of the entries, the committee were compelled by the rules to refuse it. Thus the race resolved itself into a contest between the British representatives. It resulted in an easy victory for Yarrow Napier, which gained on each round and eventually even overlapped Rose en Soleil. The course was the same as that for the eliminating trials, a distance equivalent to about 32 nautical miles.

The times were:—

	h.	m.	s.
Yarrow Napier (Club's Gold Medal) ...	1	30	8
Rose en Soleil (Club's Silver Medal) ...	2	0	1½
Daimler I. ...	2	7	25

### ROAD REPORTS.

FINCHLEY.—The district council has found the use of "Akonia" very effective in laying the dust on the main roads, and at the last meeting sanctioned the expenditure of £60 on a further supply.

BETTER ROADS.—Mr. A. Pimm, 76, Stoke Road, Guildford, sends a circular he is issuing on the dust question, in which he advocates the disuse of natural stone, and the formation of a better shape of the road with harder material, especially iron for wheel tracks.

HORSHAM.—Half a mile of roadway at Billingshurst, on the main road to Portsmouth, has been treated with tar, with very satisfactory results. At the meeting of the Horsham Rural Council it was stated that all the week motor-cars were continually running through to Goodwood and back, and there was no dust.

STAFFORDSHIRE.—The County Council has declined to accede to the request of the Blore Heath Rural District Council to place danger boards at certain places within its district. They intend to inquire into the ways and means of widening the bridge over the river Dove about

1½ miles from Uttoxeter on the main road to Derby. Several accidents have been only narrowly averted there of late, there hardly being sufficient room for a horse and cart to turn round—a danger appreciated when they are met by motor-cars.

HIGH WYCOMBE.—With the object of minimising the dust created by the passage of motor-cars through the town of High Wycombe, which is situated on the main London and Oxford road, the authorities are having the principal streets laid with tarred material, which is steam-rolled, thus also having the advantage of providing an easy running surface for motor traffic.

### ROAD MAXIMS FOR MOTORISTS.

IN order to prevent careless driving of motor-cars and consequent accidents the Massachusetts Automobile Club, through its Runs and Tours Committee, has recently issued the following "Road Maxims for Motorists":—

1. Drive slowly—
2. Through towns and villages.
3. When approaching cross roads or turning corners.
4. When passing schools, cottages and churches.
5. On dusty or muddy roads when passing cyclists or pedestrians.
6. When meeting or overtaking lady cyclists; and do not steer too close to them.
7. When entering a main road from a side road.
8. When you see a drunken man on the road.
9. When passing any live animals on the road—cows, sheep, dogs, &c.
10. Stop—
11. When an accident of any kind occurs, whether your fault or not. Render all the assistance in your power, and as a safeguard against

The above illustration depicts the "Adams-Hewitt" Landulet, one of the latest productions of the Adams Manufacturing Company, Limited.

1. future proceedings ascertain the names and addresses of a few witnesses.
2. When you see any likelihood of a horse becoming restive. If necessary, do this even before the driver holds up a warning hand. Always assume—
3. That other road users may do the wrong thing, i.e., a driver may pull the wrong rein, or a pedestrian may hesitate and try several courses.
4. That it is your business, not the other man's, to avoid danger. The road is free for all; therefore be courteous and always drive like a gentleman.

### TOWN CARRIAGE COMPETITION.

WITH reference to the A.C.G.B.I.'s Town Carriage Competition, mentioned in our Comments, the following points will be taken into consideration in making the awards, viz.:—

- A. General design of complete car (chassis and body).
- B. General appearance and finish of body work.
- C. Absence of smell and smoke; proper direction of exhaust vent.
- D. Absence of leakage of lubricant.
- E. Absence of noise with car stationary or running.
- F. Absence of vibration with car stationary or running.
- G. Smoothness of running and comfort of passengers. An examination will be made as to the use of adequate tyres, size of wheels, spring suspension, and means of preventing road shocks.
- H. Ease of cleaning (a) exposed metal work and coach work, and (b) machinery (including oiling).
- I. Ease of access for repair (removal of body, access to important working parts, access to tools, to lubricating holes and Stauffers, &c., removal of undershields, access to concealed gear).

A skilled man (who may be the driver) shall be in attendance t

dismantle or detach or adjust any part of which he may be called upon to display the accessibility.

- K. Ease of starting (a) cold, (b) after recent use, with relation to smooth action of clutch (if any) and to smooth yet rapid acceleration.
- L. Ease of stopping and speed changing without jerks or noise. An examination of the brakes will be made both as to their efficiency and design.
- M. Ease of manoeuvring.
- N. Comfort of passengers in relation to cushions, folding seats (if any), &c., number of passengers carried exclusive of driver, access to interior by side entrance, exclusion of rain, storage place for tools and parts.
- O. Comfort of driver in relation to easy manipulation, shelter from wind and rain, ease of signalling to other vehicles (without special mechanical devices being required for this latter purpose).

The entry fee will be £5 5s. for each vehicle, and the trial will not be held unless a minimum of ten vehicles are entered on or before October 1st, on which date the entries will close.

### THE STORAGE OF PETROL.

MR. SEDGWICK CURRIE, of Salisbury Road, West Kilburn, was summoned at the Marlborough Street Police Court, London, W., last week for keeping petrol without a licence, owing to his licence lapsing by reason of being violated, at No. 50, Brooks Mews, Bond Street, W. Mr. Chilvers, who prosecuted on behalf of the London County Council, said that the defendant held a licence for 12 gallons of petrol at Brooks Mews, but it lapsed owing to his not having complied with its terms by failing to fix a ladder for the escape of persons sleeping in the upper part of the premises, in case of fire. The place was an old coach-house, and when the inspector visited it on July 21st he found over 60 gallons of petrol there, a large quantity of it being stored under the staircase. Mr. Morell, for the defendant, said that the petrol was only at Brooks Mews for two hours, having been sent from Mr. Currie's other establishment, where his licence permitted him to store 100 gallons. If the inspector had called about an hour later he would have found none there. It was only there as visits from the Duke of Portland and other titled customers were expected, and was all to be immediately used in charging cars. Mr. Currie was a large contractor, and wished to comply with the law in every respect. The licence had not been kept away from him for anything to do with petrol, but because his ground landlord, the Duke of Westminster, declines to agree to alterations of the premises. Mr. Kennedy.—There is no licence. This is a careless and very wrong thing to do. He must pay £10 and £3 3s. costs.

At the Sheffield Police Court, Messrs. Thomas Hague and Co., Ltd., electrical engineers, of West Street, Sheffield, and the secretary of the company, Sydney F. Walling, were summoned under the Petroleum Act of 1871 for keeping on their premises a quantity of petroleum in excess of what they were licensed for. Mr. H. L. Coath prosecuted on behalf of the Sheffield Corporation, and Mr. Ernest W. Clegg defended. Mr. Coath said that although two summonses were issued he did not ask for or expect a conviction in both cases. The reason for summoning the company and the secretary as well was in order to avoid the difficulties that sometimes arose in fixing the offence where limited companies were concerned. A licence was granted in October empowering the company to keep two 5-gallon tins of petroleum, but when an inspector visited the firm's premises on June 13th he found twelve 2-gallon tins in addition to the amount allowed by the licence. The inspector gave corroborative evidence, and stated that the secretary told him the twenty-four gallons of petroleum were only there awaiting being fetched away by a customer. A short time afterwards when he called the petrol had been removed. For the defence Mr. Clegg did not deny that the quantity of petroleum stated by the prosecution was on the premises. He submitted, however, that the case did not come within the section quoted of the Act of 1871. They were charged in the summons with having 24 gallons of spirit kept without a licence. Looking at the facts from a common-sense point of view, were they keeping the petroleum without a licence? It had been ordered for a customer, to be delivered at 3.30, and about 4 o'clock, a few minutes after the inspector had called, the customer had fetched it away, as had been arranged. That, he contended, was not keeping the spirit there within the meaning of the Act. The law must be read reasonably and in a common-sense way—the Act meant in a permanent sense, not keep it there for a matter of a few minutes. A fine of 10s. was inflicted upon the company.

### CASES AGAINST MOTORISTS.

MRS. LOCKE KING, of Brooklands, Weybridge, has appeared at Kingston to answer a summons accusing her of exceeding the twenty mile speed limit at Portsmouth Road, Walton. According to the police, defendant drove her car at a speed equalling 30½ miles an hour. When asked to produce her licence she said she had forgotten to bring it with her. The defendant was fined £2 and costs.

At Calne Petty Sessions, Hugh Jones, chauffeur, in the employ of Prince Hatzfeldt, of Draycot Park, Chippenham, was charged with driving a motor-car to the danger of the public at Cherhill early on the morning of July 23rd. Another summons charged him with exceeding the speed limit. The Bench decided that there was not sufficient evidence of the car being driven to the danger of the public, and

dismissed the case on that charge, but they thought that the defendant had to some extent exceeded the speed limit, and for that offence he would be fined £2 and costs (14s. 3d.).

THE chauffeur of Mr. Joseph Nicholson, of Wheatfield, Headingley, Leeds, was charged at Leeds with exceeding the speed limit on Mr. Nicholson's 60-h.p. Napier, the allegation being that he covered the distance of 220 yards at the rate of twenty-eight miles an hour. The car is provided with two of Messrs. S. Smith and Son's speedometers, one of which has a tell-tale hand thereon, and this indicated nineteen miles an hour. Upon this evidence being given the stipendiary magistrate suggested a test of the accuracy of the speedometers, which was duly carried out, and on their being found accurate he dismissed the summons, stating that in his judgment a mechanical instrument of this kind was more reliable than the observation of police officers, as, without casting any imputation as to their veracity, the human element thereby introduced was more capable of error than a reliable instrument.

At Lancaster, five motor-car drivers have been summoned for exceeding the speed limit. All were fined.

THE motor trap at Eggborough, near Snaith, led to seven motorists being fined in the aggregate £25, at Snaith Sessions.

At Cromer the chauffeur for Miss Edna May has been fined £7 and costs for driving a motor-car at a speed of twenty-six miles an hour.

THE driver of a motor-lorry was severely lectured by the magistrate at the Tower Bridge Police Court on Monday for being drunk while in charge of his vehicle. After the stern bearing of the magistrate a fine of only 10s. must have been a great relief.

SEVERAL motorists were summoned at Solihull (Birmingham), the other day for dangerous driving, exceeding the legal limit, failing to produce licences, &c. Convictions followed in eight cases, one was adjourned, and one was dismissed. In the latter Mrs. Lizzie Fox, Birmingham, was summoned for riding a motor-cycle at a dangerous speed. Police-sergeant Tuckwell said that he was riding his bicycle on the Coventry road, Sheldon, on July 12, when he saw defendant, who was riding a motor-cycle, come round the corner of the road close to the footpath on her wrong side. He estimated the speed at thirty-five miles an hour. He jumped off his machine, and tried to take the front number, but was unable to do so, and took it from the back. The defendant said that she had an accident to her chain at the time, and was going along carefully. She had ridden a motor-cycle for fourteen months. She had to lean forward to oil the engine, and she also had to hold the levers of her carburettor, which were loose, but she always had a full view of the road. The Bench said they thought it a proper case to bring before them, but there appeared to be some doubt about it, and defendant would have the benefit of it. The case would be dismissed.

At Beaconsfield Court the police have sadly confessed that in attending to one motorist caught in their trap several others escaped. The gross return to the revenues of the Court that day was only one fine of £3 and costs.

### POLICE TRAPS.

A TRAP was in operation on Sunday, the 5th inst., on the Ipswich-Colchester road, between the seventh and ninth milestones from Ipswich. Policemen in plain clothes stood about 200 yards on the Ipswich side of these respective milestones and took times, but apparently did not stop cars.

A CORRESPONDENT writes:—"I have authentic information of a trap on The Fairmile (not Cobham) five miles from Lewes and six from Eastbourne. It is an electrically worked one, and is in operation every Sunday.

MR. OSBORN, of Messrs. Osborn and Company, Ltd., writes:—"Just a line to notify you that there is a police trap of which, unfortunately, I was a victim, about three miles beyond Colchester on the Yarmouth side."

BETWEEN Great and Little Marlow the police are amusing themselves and annoying motorists by a timing arrangement.

THE Lake District is becoming a danger spot; no fewer than four traps have been reported between Keswick and Windermere.

THERE is a police trap in Bromley Road, Greenwich.

### TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

# THE Motor-Car Journal.

VOL. VIII.]

LONDON, SATURDAY, AUGUST 25, 1906.

[No. 390.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

## A PRIZE COMPETITION.

### FOR THE BEST AUTOMOBILE "LIMERICK."

OUR readers are familiar with the form of the "Limerick." We shall be pleased to offer a prize of one guinea for the best original example, and two second prizes of half a guinea each. The theme is to have reference to a motor-car, motorist, club or association concerned with automobilism, and the matter must be original and not ill-natured.

Last week we announced that the Limericks must be sent to the office of *The Motor-Car Journal* not later than to-day (Saturday), on postcards, with the author's name and address clearly written. We have decided to extend this time to Monday, the 27th inst.

The winning examples will be published in the same issue of the *M.C.J.* in which the announcement of the award is made; and it is also our intention to publish a selection from the unsuccessful competitors. The Editor's decision will be final.

We give an example of the Limerick as a suggestion to competitors:—

A Commission by law was decreed  
Before which car-owners could plead,  
They said their full say,  
Waited many a day;  
And now! Good bye to the limit of speed.

## COMMENTS.

### Looking after the Roads.

Now that it has become, in a special sense, the guardian of the roads, protecting users from the provocative methods of the police and advising motorists where danger lurks, the Automobile Association might well extend its activities to urging landowners to keep the hedgerows near sharp turnings and at dangerous corners well trimmed. There is also useful work to be done in the erection of notice boards where the supineness of local authorities knows little regard for the safety of those who use their indifferently-kept roads. Touring throughout the country, we have lately been impressed with the tantalising condition of many of the notices that were placed on the highways in the early days of cycling. These have become weatherbeaten, and are now rusting to decay in many places; and the extension of a scheme of warning boards throughout the country would be generally welcomed by motorists and the public alike.

### The Automobile Association.

We mention the Automobile Association in this connection because of its growing favour among those who use the road. Already its membership is well on the way to 2,000, and at the meeting of the committee on Tuesday 270 new members were elected, including Earl Roberts, Lord Blythwood, the Duke of Buccleuch, Viscount Castlereagh, Viscount Churchill, Lord Willoughby de Eresby, M.P., Sir Lionel Darell, Bart., Sir Neville Gunter, Bart., Baron Pierre de Gunsburg, Lord Iveagh, Lord Kenyon, Lord Yarborough, Lord

Londonderry, Viscount Ridley, and the Hon. G. Keppel. Ladies, too, are giving their influence to the Association. Other recent accessions to membership include H.H. Princess Toussoun, Countess Ilchester, Lady Hothfield, Lady Gunter, and Lady Waterlow.

### Local Feeling.

SOMETHING of the danger that would attach to any regulation leaving the local authorities responsibility for fixing the speed limit is seen in the discussion at the last meeting of the Warwickshire County Council. Mr. W. Johnson, M.P., mentioned that sixty-one parish councils within the area of their jurisdiction had suggested the limitation of the speed of motor-cars in their villages to eight miles an hour. We believe that fifteen other councils in Warwickshire have since memorialised the County Council to the same effect. Under such circumstances scarcely a road in the county would be free from the obstruction of these prejudiced persons. It is certainly a state of things which should convert any wavering motorists to the view that all regulations with regard to speed should be left to the central rather than the local authorities.

### Motor-Cars and the Post Office.

It is not generally known that there are fourteen postal motor services in operation between more or less distant towns, besides a number in London. In his annual report the Postmaster-General says that the service between London and Brighton, which was established on June 1st, 1905, has so far worked smoothly, and, as this is one of the longest and heaviest of the existing road services, its success has gone far towards demonstrating the possibility of establishing a really satisfactory motor mail service. It is hoped to establish several additional services during the current year, the most important of which are: London and Hastings, with a branch from Tunbridge Wells to Eastbourne; London and Colchester, with a branch from Chelmsford to Southend-on-Sea; London and Hitchin, and Leeds and Huddersfield. A considerable financial saving is estimated to result from this encouragement of the mechanical vehicle.

### On Perceiving what is not seen.

A NEW sense is now required of motorists, who, to the faculties of being able to taste, smell, hear, feel, and see what is actually in existence, are expected—by the Newcastle magistrates at least—to perceive what they do not see. This interesting dictum has occurred in a case heard on Saturday, when the driver, A. H. Jones, to Lord Lonsdale was fined 20s. and costs for negligently driving a motor-car. The constable said he held up his hand for the driver of the car to stop in Grainger Street, but the chauffeur disobeyed the signal, and drove straight over the proscribed crossing. In defence the driver said he did not see the constable's hand held up. He was accustomed to policemen on point duty, having driven the King, the Duke of Connaught, and other royalties, and he was in the service of the Earl of Dudley for five years. Lord

Elphinstone gave evidence to the effect that he was in the motor-car on the day in question. They proceeded up Grainger Street at a walking pace, certainly not more than four miles an hour. A tramcar was at a standstill, when Jones went quietly past the crossing with the motor-car. There was no question of accident at all. After he had passed the tramcar he heard a shout. He noticed a policeman, who was about level with them on the road. He was not holding up his hand, nor was he beckoning for the car to stop. If he had they could have stopped in half a yard. As the officer made no sign for the car to stop, they went straight on. His lordship added that he had driven in motor-cars many times in London, and he was used to policemen's signals, and always stopped at once. The chairman of the Bench said they believed the constable held up his hand—although no witnesses were called to support that suggestion—and "if the defendant did not see it he ought to have seen it." They declined to raise the fine to a guinea, so as to allow of appeal, and altogether proved their capacity for sitting on the Surrey Bench.

### The Great North Road.

EVERY year the motor-car traffic on the Great North Road grows in volume, rendering increasingly useful the operations of the Automobile Association in convincing the police that the setting of traps is a foolish pursuit. Elsewhere we publish an article on the condition of the road, which, be it noted, is "subject to market fluctuations," by which we mean

The Syston Park Hill-Climbing Competition.—Sir Hickman Bacon's 6-h.p. Wolseley Car, the winner in Class A, is in the foreground. (See page 550.)

that traps are subject to changes and may be varied, as the police find their set purposes frustrated by publicity. Anyhow, motorists journeying that way, or likely to use the highway to the North during the next few weeks, will be forewarned—and that may save fines.

### Motor-'Buses.

WHILE Sir Devereux Pile, as chairman of the Great Eastern Motor Omnibus Company, was last week dilating upon the future of the motor-'bus, one of the vehicles of his company was making a somewhat disastrous onslaught on a house facing Wanstead Flats. The roads around this district are being largely used as testing grounds for such motor vehicles. So long as they keep to the highway, little complaint is likely to be made, but if many of these erratic wanderings take place some adverse comments will probably be heard in the district. Sir Devereux made mention of the petition which has lately been signed by many eminent people, as well as some who have no claim to distinction, pointing out that a great many of the signatures were those of owners of cars. We hardly see the application of such an observation, for there is no doubt that the noise and rattle of the motor-'bus will have to be con-

siderably reduced ere London reaches anything like that quietness which was once her pride. The first thing that strikes a provincial man or woman coming to town is the extraordinary noise of London traffic, and when to this is added the monotonous whiz of the steam cleanser, cleaning the walls of London offices, the noise nuisance becomes as intolerable as is the dust cloud in the country.

### A Motor-'Bus Trial Wanted.

NOT often do motor-'buses ride on to the pavement, although they have been known thus to leave the commonplace track. At the same time the risk that such may happen suggests whether it would not be possible to have a real test of the merits of the various types now running upon the streets. The organisers of motor-'bus services would doubtless lend their support to the scheme if it were developed under impartial auspices, for they are extremely desirous of ascertaining the relative merits and finding out the comparative defects of those types now in service. Fortunately they are recognising more than was the case a few months ago that the conditions of urban and rural traffic are essentially different, and that they must not expect the vehicle that is suitable for the easy level running of the City to be equally serviceable in long distance pleasure trips over hilly ground and stiff places.

### Irresponsible Horses.

REALLY the time is coming when motorists will have to include horses among the offenders of the highway whose assaults have to be made the subject of criminal proceedings. Lately the Motor Union has been compelled, by the seriousness of some attacks upon its members, to institute legal proceedings and secure the conviction of persons who have not only been unruly on the highway but have assaulted them as well. Now comes the case of a horse making a most unprovoked attack on the unoffending motor-car. The vehicle belonged to Mr. W. H. Jackson, of Halifax, and was left standing in front of the Post Office at Selby while the driver sought the services of a repairer. About the same time a cab drove up to a butcher's shop. This vehicle had already pulled up when the horse, which is supposed to have been stung by a wasp, plunged and ran off in the direction of the motor-car, with which it collided. A hind wheel of the trap was smashed, as well as both shafts, while the horse was injured about the legs. The motor-car had a back wheel smashed to pieces, the lamp broken, and other damage done to it. The automobile is not the only form of traffic which occasionally runs amok.

### Getting Cars to the Isle of Wight.

THE value of Press publicity is being more and more realised by railway managers, and has received good illustration from the experience of the London and South-Western Railway in connection with motor-car traffic between the mainland and the Isle of Wight, near Lymington. Last summer they carried about a dozen cars, this season they have up to the present dealt with close upon a hundred, consequent, we are informed by the officials at Lymington, on the attention drawn in our own and other motor journals to the facilities offered. In most cases owners have volunteered testimony as to the convenience of that route to the island.

### Steam Road Wagons.

DEALING with the heavy steam motor-wagon exclusively, the book which Mr. William Norris, A.M.I.C.E., has written, and Messrs. Longmans, Green and Co. have published, is likely to be regarded as a standard volume on the subject. Care has been taken to include particulars of the latest, and—by reason of the 1905 Board of Trade Regulations—important modifications and designs of heavy steam road wagons, and to give an accurate and impartial analytical account of past and present practice. With this object illustrations and drawing,

necessary to explain the text are extensively made use of, and the publication should serve a purpose alike useful to manufacturers and users, as an intelligent aid to design and as a medium to enable firms intending to start with motor traction to select the best possible vehicles to fit their particular requirements. Particular attention has been devoted to constructional details to show what has been attempted in the past, the shortcomings which experience manifested, and how and what improvements have from time to time been made to overcome, one by one, the difficulties and deficiencies as they arose. The majority of the outline technical drawings have been made under the author's own supervision, and are new, the experience of Mr. Norris being a valuable factor in his qualifications for writing such a standard volume.

**Adjustments not  
Always Necessary.**

LOOKING back to the days of the Liverpool trials in 1889 and again in 1901, real progress has, of course, been made, the two most difficult problems that have been encountered being the designing of a suitable boiler and proper road wheels. In planning a road wagon regard must be paid to the persons into whose hands it was likely to be entrusted. If

matters went wrong the owner's mechanical knowledge sufficed to effect a remedy. But the car was always ready for the road, and managed to keep going when there.

**The Protection of  
Motorists.**

THOUGH "Defence, not Defiance," might be regarded as the motto of the Motor Union, occasions have arisen when it has been found necessary to assume an aggressive attitude in safeguarding the interests of members. Recently action has been taken by this powerful organisation in three cases of assaults on motorists, in a like number of instances of obstruction, and in one case of stone-throwing. In all these instances useful local lessons were taught which should have the effect of deterring such offences in the future.

**Coaching by Car.**

ON the banks of Lake Quinsigamond, where the great Yale-Harvard boat races were rowed in former years, Mr. G. Taylor, one of the best known aquatic coaches of America, may be seen training crews from his automobile—a Pope-Hartford car, be it noted *en passant*. With one hand on the

King Edward and the Kaiser enjoying a spin on one of the German Royal Cars at Saalburg.

designers could rely upon the engines being systematically overhauled, run and adjusted by skilled mechanics, as are railway locomotives, there would be scarcely any limit to the refinements which might safely be introduced. It is the practical experience of Mr. Norris that refinements in details in motor-wagon construction—no reliability can be attached to securing really first-class men as drivers—can be extended to limits overrunning the advantages which would accrue by such refinements if under skilled supervision. Much trouble has been occasioned by allowing the driver opportunities of making his "adjustment." If bearings are made with ample surfaces, and are provided with a continuous supply of lubricant, adjustment is not necessary for some years. The same experience has been found in connection with the driving of light cars. One prominent London motorist was continually having trouble owing to the way in which his driver was always adjusting and altering the mechanism; at the same time the body work was generally in a dirty condition. So our friend advertised for a coachman who was in a nescient state with regard to motor-cars. He was trained to drive the car, and when mechanical

steering wheel and the other holding his megaphone he manages to coach his crews. There were men who said it would be impossible to do such work from an automobile, but this instance leads to the question—What cannot the motor-car do? Certainly a good car and a good driver are two factors that constitute the means for almost any achievement.

**New London Electric  
Ambulanc. s.**

A BEGINNING has been made with the installation of the new City of London motor ambulance service, which is expected to be in working order before the end of the year. In addition to the two central stations—at Bishopsgate Street and St. Bartholomew's Hospital—where the ambulances will be housed, there will be over fifty call stations. These will be distributed over the City, and will be similar in appearance to the existing fire alarms. The purchase of two electric motor ambulances is provided for by the scheme, but only one, which is to cost between £400 and £500, has so far been ordered, being considered desirable to gain some experience in working

before a second is acquired. It is proposed to retain the present hand ambulances as auxiliaries to the new service, the working of which will be regarded with universal interest.

#### A Thief with Humour.

To steal a car may be regarded as a piece of impudence; but then to hire it out as a means of profit casts a gleam of humour over the business which the rightful owner is not likely to appreciate. However, we congratulate Mr. Hodge, of East Finchley, on the discovery of his car. It was found on Monday at Horton, near Banbury, where the thief had been letting it out on hire at 5s. for the afternoon. The son of the vicar of Edgehill was one of a party that had engaged the vehicle, and, noticing that certain obliterations had been newly made, telephoned at once to Messrs. J. Keele and Co., who were quickly able to identify the vehicle. The car remains, but the thief has disappeared.

#### Borrowing and Lending Cars.

THE advice of Polonius to Laertes with regard to borrowing and lending is as applicable to motor-cars as to bank notes. There is danger in the practice—danger to car and to friendship, for, although the driver may be careful and the passengers have regard for the appearance of the carriage work and upholstery, there is always the chance of something going wrong and the owner fancying that the car never runs so well after its return. So much for the loan of vehicles to friends—a course only to be permitted on rare occasions. Shakespeare's immortal philosophy is always to be observed in the relations between master and man. Unless engaged on some definite mission the chauffeur should never be allowed to take the car out; on his part, the driver should never desire to run the vehicle without authorisation. The invitations of friends to give them "just a short run" in the car should always be declined, and drivers should remember that although they may be responsible for the vehicle it is not their own property—a fact many are prone to forget.

#### The Motor Driver's Spine.

NEW ailments are constantly being discovered. The "motor throat," the "petrol eye," the "steering hand," and the "oily face," are all known to the medical profession and the motoring fraternity. Now a writer in the "Lancet" has been good enough to find another species of disease and to associate it with the automobile. This is the "motor spine," and the first victim was a motor-omnibus driver—a healthy, temperate man. On the day previous to his illness a certain part of the mechanism of the vehicle he drove acted badly, and each time it stopped it had to be restarted by the patient, who thus used a considerable amount of physical energy. After a wearisome period of duty he was in a highly nervous state, and his sufferings were so intense that he received hospital treatment. He complained of acute pain in the right hip, of a dull, aching pain across the loins, and of a right leg so painful that he could scarcely bear the weight of the bed clothes upon it. Moreover, owing to the tenderness of his back, he could not rest upon it. And to this the name of the "motor spine" has been given.

#### The Dangers of the Road.

A SAD accident which has taken place in Pontefract illustrates one of the dangers to which motorists are subject on the road. An elderly man was riding a motor-cycle—proceeding very carefully on his right side of the road—when a lad who was learning to ride an ordinary bicycle collided with him and, falling heavily on his head, the motorist was killed. A medical man who saw the occurrence said there was no child, dog, or other obstruction to cause the deceased to swerve, but there was a sort of magnetic influence which attracted young or

nervous cyclists to rush towards any obstruction that came in front of them. The motorist was travelling about ten miles an hour, and when the lad swerved it was practically impossible for the deceased to pull up. Deceased did all he could to avoid the collision, and he (the doctor) considered that the hill was not a suitable place whereon cyclists should learn to ride. Unfortunately novices on the wheel are not always as careful as they should be in the selection of their trial grounds, and public roads, with every kind of traffic claiming its share of the highway surface, are certainly not the safest places for early efforts.

#### Irish Roads.

MENTION may be made of the many motor-car services which have been established in Ireland, and which are doing something to hasten the prosperity of a land where privation has hitherto hung about like a pestilence. What is now wanted to enable the people to secure the full benefits of the new locomotion is that the local authorities should recognise the uneven surfaces of many of their highways, and learn to understand the association of good roads with national welfare and comfort. Just as in the old days of the turnpike and before railways caused the desertion of the highways, the care of roads was a matter of supreme importance, so we are again recognising that they are the avenues to prosperity—both individual and collective.

#### The Next Motor Union Meet.

AN opportunity for discussion will be provided at the next provincial meet of the Motor Union, to be held at Scarborough on the 22nd prox. This venue has been selected on the invitation of the North Yorkshire Club, and a welcome characteristic of the county will doubtless be given those who attend. Birmingham, Harrogate, Chester, and Bath have all left pleasant memories of the peregrinations of the Motor Union, and Scarborough is not likely to fall behind these in its cordiality. The Corporation of the town is associating itself with the matter, and the Yorkshire Club should find it a good opportunity to bring some of the unattached motorists of the county into membership.

THE last day for sending rhymes in the Limerick competition—see page 537—is Monday next, the 27th inst.

ELSEWHERE in the present issue will be found an interesting article on pneumatic tyres by Mr. F. J. J. Glynn, who, as general manager of Gaulois Tyres, Ltd., is well qualified to deal with the subject.

EARL TEMPLE, of Stowe, has just ordered from Messrs. Ducros Mercedes, Ltd., a 35-h.p. Mercedes car, fitted with Roi des Belges coachwork, the upholstery being carried out in the familiar Mercedes red.

ACCORDING to Mr. G. Bernard Shaw the motor-omnibus is "cheap, swift, clean, humane, interesting, and pleasant," yet he would "be glad to see them made less noisy, and driven by men who would not burn their lubricating oil as well as their petrol."

THE recent fire at the carriage works of Messrs. W. and F. Thorn did not seriously interfere with their business arrangements, as the men were transferred to their other branches and got to work again within a week. The premises in Great Portland Street, W., will be rebuilt and extended this year, giving further facilities for motor body work, in which they have been engaged since the beginning of the motor industry.

THE Darracq-Serpollet Omnibus Company, Ltd., have arranged with the Scottish Automobile Club for the official observance by the Club of a trial of their Darracq-Serpollet steam omnibus. The trial will embrace considerable parts of the Scottish Reliability Trial route, and will include the following towns:—Glasgow, Kilmarnock, Ayr, Dumfries, Moffat, Edinburgh, Stirling, Perth, Dundee, Aberdeen, Huntly, Elgin, Grantown, Pitlochry, Stirling and Glasgow. It will start from Glasgow about the 24th inst. and will extend over eight to ten days.

## THE GREAT NORTH ROAD.

**T**HOUGH there is not that infinite variety of scenery on the Great North Road within every fifty miles which makes the Ripley road dear to the southern motorists, for a "direct drive" to Scotland it has many admirers, and with reason. If the trip be divided into two good long days there is a pleasant certainty of finding excellent food and much comfort at the hotels *en route*. For instance, on the first day a reasonably early start will, in the ordinary course of events, plant the motorist at the Old Bell, Barnby Moor, in time for as well cooked and served a lunch as can be found in the London cab radius. Taking chances for tea, a meal of minor importance, the day's run should end at York in time for dinner at the Station Hotel. On the second day lunch at Newcastle, after which a determined attack upon the last long stretch will bring the traveller within a mile of Edinboro' toon.

The route is as follows:—Barnet, Hatfield, Hitchin, Biggleswade, Buckden, Stilton, Stamford, Grantham, Newark, Tuxford, Retford, Bawtry, Doncaster, Wetherby (turn off here for York), Boroughbridge, Catterick, Darlington, Ferry Hill, Chester-le-Street, Newcastle, Morpeth, Felton, Alnwick, Belford, Berwick, Cockburnspath, Dunbar, Haddington, Musselborough, Edinburgh.

Just now the roads are splendid, and one can drive a

In Buckden itself the trap is rendered quite abortive for all but the most reckless drivers—who deserve to be caught—by large yellow warning notices at either end of the village, recently erected by the Automobile Association in the teeth of local opposition.

At Alconbury traps are worked up and down the hill, according to traffic. Through Stilton what is simply rabid prejudice demands that cars shall pass at a pace less than ordinary horse traffic; police opinion as to "the common danger" is elastic to the point of absurdity. Just outside Stilton the Norman Cross trap vies with Buckden for the number of its victims.

All these, of course, are not worked at one time. Past Stamford there has lately been working a trap which, in the opinion of many who know the subject, is the least unfair of all. It is a mile long, measured from brow to brow of two hills, in the valley between which nestles the village of Casterton. There being no call for excessive speed here, but, on the contrary, a real necessity for caution, motorists who follow the dictates of courtesy and consideration for others have nothing to fear.

This applies right through the county of Nottingham, until the persecution begins again at Bawtry, in Yorkshire. Between there and Doncaster (two miles out of Bawtry, to be exact) rumour has it that a gentleman whose house is for him

The Circuit des Ardennes.—Rougier taking a nasty corner near Longlier on his De Dietrich Car.

hundred miles without meeting those necessary but murderous heaps of unrolled metal. For the most part hedges are low and all danger spots are protected by triangles, except in one glaring instance at Carlton-on-Trent, in the borough of Tuxford, about 130 miles out from London. Here there is a particularly nasty S-shaped curve, with no signs of any description. We commend this to the leading associations, motoring or otherwise, for their immediate attention. Triangles should be placed there without delay, and, let it be hoped, before instead of after a terrible accident occurs.

On the vital question of motor traps we incline to the belief that the Great North Road is somewhat misjudged. There are plague spots without doubt, and the following authentic information will be of value to every considerate motor-car driver. Compared, however, with the Portsmouth road, whose round dozen of "measured distances" in the first forty miles are unpleasantly familiar to us, the record of five traps in four hundred miles appears mild.

Briefly, after the six-mile trap, which begins at the London side of Hatfield and ends on either the Hitchin or Stevenage roads beyond Welwyn, the way for any but a hooligan driver is the reverse of hard up to the sixty-first milestone, marking the notorious village of Buckden. From here to Stamford a state of war, intermittent but determined, exists.

unpleasantly near the main road aids and abets the trappers wherever possible. Distances of a quarter, half, and three-quarters of a mile are marked out, and the trappers pretend to work at wood-chopping, while their scouts watch for the approach of likely victims.

We may predict a warm week's work for them, and on all the big roads leading into Doncaster, during the race week. Indeed, the motor-car traffic may fairly be estimated to reach five times the amount of that during the opening of the grouse season, from the fact that shooting men reach Scotland by various routes, and the traffic is very evenly distributed in consequence.

From Doncaster to Boroughbridge the roads in themselves are not too good, but trapping is the exception rather than the rule. Boroughbridge is a noted place, and great care is necessary. This warning applies between Morpeth, Felton, and Alnwick, from which town the run to Edinburgh is almost devoid of untoward incidents.

IN view of the popularity of side-entrance cars, users of old-type Darracqs may be interested to learn that Messrs. H. E. Hall and Co., of Tonbridge, are making a speciality of lengthening such vehicles and converting the bodies into side-entrance.

## THE "GALLIA" CARBURETTOR.

A SOMEWHAT novel form of carburettor for petrol motors has recently being devised by M. C. De Clercq, and put on the market by Messrs. Michaud and Co., of Lyons and Paris. In the early days of the movement, when the surface type of carburettor was in vogue, several attempts were made to overcome the defects of these by the introduction of carburetting devices in which the mixture was obtained by drawing the air over or through a wick kept saturated with petrol. They were known as wick carburettors, and, while most of them were satisfactory in use, they had the drawback of being somewhat bulky in size. About this time the spray type of carburettor sprang into prominence, since which all attention has been devoted to the improvement of this variety. The latter, however, is not without its drawbacks, many motorists having suffered from carburettor troubles due either to the blocking up of the small petrol outlet at the spraying nozzle or to the float failing to act properly. Mr. Worby Beaumont, in dealing with the subject of carburettors in his work on "Motor Vehicles and Motors," remarks that "one of the most perfect would be the application of capillarity and of other simple means of securing automatically petrol-wetted surfaces. A carburettor box might, for instance, be filled with

Section of "Gallia" Carburettor.

plates so placed that they are occasionally awash, and are kept moist always at the lowest part by capillarity, the air being forced to traverse the greater part of their surface. It is obvious that if these plates were perforated they would present larger surfaces, and that if wire netting like that used for sieves, with, say, 300 to 400 holes per square inch, were employed the wetted surface presented to the moving air in quite a short path might be very large. A carburettor on this system would be of small dimensions as compared with most of those in use, and petrol in them would be uniformly evaporated if there were no outlet for the carburetted air except that to the motor."

The requirements of an evaporation or wick type of carburettor thus set out by Mr. Beaumont appear to have been carried into effect in the "Gallia" apparatus, of which we are now able to give general and sectional views. Referring to the latter, it will be seen that the air is drawn in through a valve *b* at the bottom of the apparatus, the valve being opened by the suction of the motor. The air thus drawn in is forced to pass through the wire gauze discs *c*, between which are layers of spongy material *d*, causing it to be impregnated with petrol vapour; in rising the carburetted air meets the cap *e*, which deflects it sideways through the gauze *f* into the chamber above, and thence, through another gauze *g*, into the

admission pipe *A* to the engine. The flow of petrol to the discs *c* is automatically regulated. It will be seen that as the air valve *b* is raised by the suction stroke of the motor, it bears against and lifts the stem *h* of a valve *l*; this permits the petrol in the pipe *k* to enter the space *l*, the spirit then finding its way to the gauze discs by the passages *m* and *o*.

The apparatus is intended to be mounted at a lower level than the main petrol tank, from which it is fed by gravity. The pipe is provided with a feed regulating valve the position of which can be regulated once and for all in the following way. After first closing the valve completely it is opened to the extent of a quarter of a turn and the engine started up. If misfiring ensues, notwithstanding that the ignition apparatus is known to be in perfect order, it is an indication that the flow of petrol is insufficient. The valve is consequently given another quarter of a turn, which will in all probability give rise to a smoky exhaust. Then by very gradually reducing the petrol flow by screwing down the valve until all signs of smoke in the exhaust have disappeared, the point will be obtained where the motor will give its maximum of efficiency with a minimum of heating. This once obtained, a mark may be made on the stem of the valve, so that when used to shut off the petrol supply the right degree of opening can again be easily obtained. A throttle valve can be arranged on the admission pipe *A* in the usual way, while the quality of the mixture may be varied by admitting more or less fresh air through holes *n*, which can be opened to any desired extent by the regulating disc *v* controlled by the lever *p*. A jacket *x* is provided through which part of the exhaust gases can be circulated in order to heat the evaporating chamber in cold weather, the gases entering the jacket at *y* and emerging therefrom at *z*. In summer it is unnecessary and undesirable to heat the chamber, so that a tap should be provided on the pipe *y* in order to shut off the exhaust gases. In contradistinction to the usual opinion that a smoky exhaust is due to over lubrication, Messrs. Michaud state that it is the result of an excess of spirit introduced into the explosion chamber, and that by reducing the supply of petrol until the smoke disappears a great economy of fuel is effected. In addition to the advantages claimed for the apparatus in the way of its reliability and regularity of action, owing to there being no small passages to become blocked, the makers claim that there is no danger of fire, owing to the reduced amount of spirit contained in the carburettor. We may add that the apparatus, which is made in a variety of sizes in order to render it suitable for motor-cycles and cars of different horse-powers, was awarded a silver medal in the competition of carburettors organised last year by the French Automobile Club.

ALREADY motorists are thinking of the Isle of Man, where the Trophy Race will be held next month, and several of the Douglas hotels, including the Villiers, are reminding us of the welcome that awaits motoring visitors to their hospitable quarters.

WE learn from Turner's Motor Manufacturing Company, Ltd., that they are now fitting to the Turner-Miesse steam cars a new burner regulator which enables the heat of the generator to be regulated to any desired extent when the car has to stand for half an hour or more, or when waiting about whilst the passengers are shopping. The main burner itself is instantaneously turned down, and consequently there is no need when standing of any pilot light, which is always liable to get blown out in a high wind, while the car is always ready for an immediate start. The new regulator, which was suggested to the firm by Mr. W. Hill, of Aldeburgh, an enthusiastic user of a Turner-Miesse car, has been subjected to exhaustive trials, and obviates the complaint that has occasionally been made in the past that a steam car is unsuitable for shopping because of the difficulty of maintaining the generator at the requisite temperature to enable an instantaneous start to be made.

## SOME CURRENT TOPICS.

### The Horse Power of Motor-Cars.

Some weeks ago (see the *M.C.J.* of July 21st last) we gave the formula which has been adopted by the Verein Deutscher Motorfahrzeug Industrieller, or German Motor Manufacturers' Union, for estimating the horse-power developed, not by the engine, but at the road wheels of the car. The formula, which has been adopted by the German Government in connection with the new scale of taxes on motor-cars based on the horse-power of the vehicles, is as follows:—

$$N = 0.3 \times i \times d^2 \times s,$$

where  $N$  = horse-power,  $i$  the number of cylinders,  $d$  the diameter of the cylinder in centimetres, and  $s$  the stroke in metres. In connection with this matter, Mr. T. Blackwood Murray, of the

in mesh, the requisite pair of gear wheels being made to transmit the power either by means of clutches or sliding feathers on the shaft, but so far the *train balladeur*, or sliding pinion type of change-speed gear, although it has always been condemned by engineers, still continues by far the most largely used type. In view of the rapid increase in motor-buses, and the frequent stops and re-starts these vehicles are required to make, there would certainly appear room for some improvement in the change-speed gear, and in this connection the brief particulars that have reached us of one in which the gear changes automatically to suit the road conditions, and which is being fitted to an American car, are of interest. Broadly speaking, the gear is of the type in which the pinions on one of the shafts run loosely, being locked thereto by means of individual clutches, the latter being of the multiple disc variety. A series of weights, arranged on the centrifugal governor principle, rotate with the engine shaft inside the hollow flywheel. When the shaft begins to rotate the governor weights commence to fly outward, but the engine runs free until the speed reaches about 300 revolu-

The Circuit des Ardennes.—Jenatsy rounding the bend at Longlier on his Mercedes.

Albion Motor-Car Company, Ltd., in a letter to us on the subject, remarks that "a glance at the formula shows that the rating of the car varies directly as the stroke of the engine, and as no account is taken of the engine speed it will be a direct incentive to the German manufacturers to make short stroke high speed engines, as these, for the purpose of taxation, will, according to this formula, be rated much below their actual horse-power. Most engineers are agreed that the rating of motor-car engines should be based on a fixed piston speed, namely about 800 to 900 ft. per minute; the formula as decided upon would only be correct for motors having a stroke about 15 centimetres. A much simpler and more reliable formula would be:—

$$N = .043 \times i \times d^2,$$

where  $N$  = horse-power,  $i$  the number of cylinders,  $d$  the diameter of the cylinder in centimetres."

### An Automatic Change-speed Gear.

Many efforts have been made to bring about the general adoption of change-speed gears the pinions of which are always

tions a minute, when fingers actuated by the weights press the plates of the low-speed clutch together and the low gear takes up the drive. The plates of the clutch of course slip at first, but take hold firmly as the speed of the motor increases and the governor weights act more strongly. If the throttle is further opened so as to increase the engine speed, the governor weights will fly out still further and compress the spring which has hitherto kept the clutch for the next higher speed out of engagement. As the higher speed gears take up the drive, the lower speed gears overrun on silent ratchets. As the engine speed falls, on the other hand, the gears automatically change down by reversing the process, and let go altogether before the speed falls to a point where the motor would come to a stop. The car on which this transmission is fitted is controlled entirely by the throttle, the gears taking care of themselves, no change lever being provided. It will be interesting to watch how the idea—which is not altogether new, it having been shown by M. Megy at the Paris Salon some years ago—will work out in practice.

## CONTINENTAL NOTES.

**The Coupe d'Auvergne.**

The Automobile Club d'Auvergne is organising a touring contest for the Coupe d'Auvergne. The event is to be held from the 3rd to the 8th September next, and will comprise classes for motor-bicycles, motor-cycles, single-cylinder cars up to a maximum bore of 120 mm., and capable of maintaining an average speed of 25 kilometres per hour; two-cylinder cars, maximum bore 120 mm., or four-cylinder cars, 90 mm., maximum speed 30 kilometres per hour; four-cylinder cars, 120 mm. bore, 35 kilometres per hour; and four-cylinder cars, 140 mm. bore, 40 kilometres per hour. The daily runs are as follows:—September 3, Clermont-Ferrand, Chateau-neuf-les-Bains, Vichy, 182 kilometres; September 4, Exhibition at Vichy; September 5, Vichy, Ambert, Le Puy, 199 kilometres; September 6, Le Puy, Saint Flour, Aurillac, 200 kilometres; September 7, Aurillac, Condat, Brionde, 181 kilometres; September 8, Brionde, La Bourboule, Clermont-Ferrand, 168 kilometres.

capacity of  $3\frac{3}{4}$  litres, equal to about 24-h.p. Altogether there were eighteen starters—three each Aries, Germain, Metallurgique, Minerva, Pipe, and Vivinus—and of these sixteen finished, the withdrawals consisting of a Germain and an Aries.

Order.	Driver.	Car.	Bore and stroke in mm.	Time.

The Coupe de Liedekerke.—Wilhelm, the Winner of the Race, passing through Bastogne on his Metallurgique Car.

**The Coupe de "Matin."**

The Coupe de "Matin" reliability trial, which commenced on the 2nd inst., is drawing to its end. After covering about 3,300 kilometres, the competitors reached Vichy on Friday, the 17th inst., and were quite ready for the rest which was accorded them on the following day. Out of the 49 which started, only 28 are still in the event, and of these, on the arrival at Vichy, only eleven have a clean score. The two Siddeley cars are still in the running, although, like the majority of the vehicles, they have lost a number of marks. On the 19th the run was to Lyons, 202 kilometres, and on Monday, the 20th, to Aix-les-Bains, 185 kilometres.

**The Liedekerke Cup Contest.**

As briefly recorded in our last issue, the contest for the Coupe de Liedekerke, organised by the Automobile Club of Belgium, held on Tuesday, the 14th inst., was won by Wilhelm on a Metallurgique. The race, which consisted of five laps of the Circuit des Ardennes, giving a total of 268 miles, was for fully-equipped touring cars having a maximum cylinder

The times per lap of the winning car were remarkably even, they varying only from 1 h. 5 min. 4 sec. to 1 h. 5 min. 46 sec., a difference of only 40 sec. The average speed, too, was exceedingly creditable, Wilhelm's time being equivalent to a rate of about 49 miles an hour. The Germain cars did well, as not only did one of them secure second place, but Perpere made the fastest lap of the day, covering the distance of  $53\frac{1}{2}$  miles in 1 h. 3 min. 46 sec.

**Miscellaneous Items.**

The Mors Company have just completed a 28-h.p. 3- $\frac{3}{4}$  ton petrol lorry for the French military authorities, for use in the commissariat service.—Caillois and Le Blon left Paris on Saturday last en route to the United States, where they will drive Thomas cars in the forthcoming Vanderbilt Cup race.—A motor-car service has been established between Boulogne, Le Touquet, and Paris Plage.—A public motor-car service has been started between Domodossola and Bognanco, Italy.—The report that the Coupe d'Or trophy was destroyed in the recent fire at the Milan Exhibition is denied.

It is proposed to hold an automobile meeting next spring at Bexhill, for which Earl De La Warr has offered the use of his private motor track.

THE value of the exports of motor-cars and parts from the United States during June last amounted to £107,853, as against only £62,699 in the corresponding month of 1905.

THE car which nightly rushes on at the Oxford Music Hall (London) through a wooden fence into a garden in Harry Tate's sketch, "Gardening," is a Peugeot.

MR. W. RIPLEY, of the Tharrawaddy District, Burma, has had a 2½-h.p. Brown motor-cycle for the past three years. He has ridden it practically every day.

THE East Grinstead Rural District Council has adopted a resolution in favour of an eight miles an hour limit for motor-cars when passing through villages.

THE Pembroke Technical Schools, near Dublin, have a firm of motor repairers in occupation of their workshops, thus giving them varied facilities for the instruction of students in automobilism.

THE London Motor Omnibus Company have received a writ in connection with the motor-omnibus disaster at Handcross. The plaintiff is the executrix of Mr. W. E. Bailey, and this will probably be regarded as a test case.

THE Chief Constable of Herefordshire, "as a matter of courtesy," has withdrawn the charge of negligent driving preferred against Walter Henry Hood, the chauffeur in charge of Major Borrodale's car, which collided with the Duke of Connaught's car.

M. A. GODIN, of 1, Red Lion Square, W.C., whose attractive album of motoring personalities has already been eulogised in our columns, will be pleased to send a copy on receipt of 2s. to cover cost of carriage, &c. It is both a tribute to the excellence of the Ducellier lamps and an interesting record of the men engaged in the motor-car industry.

JUST after midnight on Tuesday the Royal Mail motor-van LC 4,972, from the G.P.O. to Redhill, broke down on Blackfriars Bridge owing to a snapped axle. Less than half an hour elapsed between the breakdown and the arrival of another car to take its place. Its ten bags of mails were transferred, and the people of Redhill received their letters at the usual hour.

TO obviate the inclusion of no fewer than five level crossings in the course selected for the International Tourist Trophy race in the Isle of Man a shorter circuit will be followed on the 27th prox., which will necessitate an extra lap to complete the full distance. The main point of interest in the new route is the avoidance of Castletown and the run to Peel, which has been somewhat neglected in the past.

IN consequence of numerous complaints of the difficulty of hiring motor-cabs experienced by visitors staying at hotels in the neighbourhood of Northumberland Avenue and the Strand, W.C., the City and Suburban Motor Cab Company, Ltd., has made arrangements to place six of their well-known "Unic" landaulets on the rank at the corner of Duncannon Street and the Strand. The telephone number of this rank is 5232 Central, and orders received on the telephone will be immediately attended to.

MESSRS. DEAN AND BURDEN BROS.' motor-boat Scout IV, which is 25 ft. in length and 5 ft. 6 in. beam, and fitted with a 12-h.p. four-cylinder "Scout" motor with reversible propeller, was last week submitted to a long distance trial under the official observation of the Motor Yacht Club. This test trial commenced at 7 a.m. on the 14th inst., and finished at 7 a.m. on the 16th inst. The vessel ran the whole 48 hours without a single mechanical delay, the only stops during the trial being 13½ min. through water in the petrol, and 5 sec. for an accidental stop in avoiding running into a mooring in the dark. The weather was distinctly unfavourable, a strong south-west wind blowing on the 15th inst. with occasional heavy showers. The boat ran constantly and steadily throughout, and the "Scout" engine was in perfect order at the end of the trial.

## HERE AND THERE.

A RACE meeting on the Exhibition track was recently held by the Winnipeg Automobile Club.

THE Worsley District Council has resolved to draw the attention of the Lancashire

County Council to the dangers arising to the public through the lack of proper supervision of wagons and trailers attached to heavy motor-cars.

HALLEY'S INDUSTRIAL MOTORS, LTD., Glasgow, have secured an order for several 40-h.p. single-deck 'buses, to carry eighteen passengers, from Canada.

THE KNOX MOTOR TRUCK COMPANY, of Springfield, Mass., U.S.A., have just completed a 24-h.p. motor mail van for use in connection with the postal service in Mexico.

A TRIAL was made at New Scotland Yard of twenty-five new motor taximeter cabs on Saturday, and they were all passed as satisfactory for service in the Metropolis.

General View of "Gallia" Carburettor. (See page 542.)

92 AND 94, MITCHELL STREET, Glasgow, have been opened by the New Arrol-Johnston Agency, Ltd., for the sale of New Arrol-Johnston cars. Mr. E. A. Rosenheim has been placed in charge.

IN our report of the Scottish Reliability Trials reference was made to the uniformly good performances of the Continental tyres therein. Of the twenty-nine cars that started thus fitted an equivalent of 66 per cent. finished without the tyres being touched.

MESSRS. CANNON AND CO., of the Penton Carriage and Motor Body Works, Watson Street, Newington Green, N., and Mildmay Avenue, Mildmay Park, London, N., have excellent facilities for the building of all kinds of motor bodies. Their experience as carriage builders is of long standing and they have studied the details of automobile construction with a view to catering for all classes of motor-car work. They are specialising in aluminium construction and are prepared to work to customers' designs or suggest ideas for high-class work.

AN Army journal suggests that the difficulty of securing recruits for the Army Motor Reserve might be overcome if subordinate ranks of certificated drivers were established.

THE garage of Messrs. A. W. Chapman and Co. in Friars Street, Inverness, is open all the twenty-four hours of the day for the convenience of motorists in the Highlands. Repairs are also executed there.

IN the A.C.G.B.I. Speedometer competition the Jones speedometer did so well that many of our readers may be interested in the illustration herewith. This type registers the

season's mileage travelled up to 9,999 9-10 miles, as well as the speed in miles per hour. It is made in two sizes, that with a 3 in. dial showing the speed up to 50 miles per hour; that with a 4 in. dial indicating up to 60 or 100 miles per hour.

The Jones speedometers and odometers are intended for attachment to the dashboard, and are actuated by means of a flexible shaft attachment to one of the wheels of the car. The driving gear consists of a large gear attached to the hub of the wheel, and a small gear carried by a ball-bearing shaft at the end of the flexible cable and supported on the steering knuckle by means of a bracket. The ball bearing shaft is provided with a swivel base, which permits the gears to separate and dislodge any obstacle that may come between the teeth, thereby preventing damage to the gears. The spring in the swivel base operates automatically to bring the gears back into mesh. The flexible shaft consists of a woven steel wire cable enclosed in a strong brass casing. This is partially filled with a composition of graphite and cosmoline, which works down and lubricates the ball-bearing small gear shaft. Centrifugal force, the principle on which the speedometer is based, admits of a simplicity of construction resulting in compactness, durability and positive and permanent accuracy—points upon which Messrs. Markt and Co., 6, City Road, E.C., the British agents, will be pleased to assure inquirers.

MOTORISTS should know by this time that the speed limit in Richmond Park is ten miles an hour, and that those who exceed that are not wise. The local police are watchful, and the Kingston magistrates are unmerciful to drivers who are alleged to go beyond that speed.

FACING Big Ben and Westminster Abbey, the new home of the Reo Motor Co. occupies one of the most distinguished positions in London. Behind the Canning statue, and practically adjoining the Middlesex Guildhall, is a building erected about a century ago for one of the first national schools in the country. This has just been adapted for a very modern purpose, viz., the exhibition of an up-to-date motor-car, favourably introduced to the British public in the late Scottish Reliability Trials, when a 16-h.p. Reo car gained 798 out of 800 marks for reliability, the trivial loss being due to ignition. On the hills it achieved distinction, being the second speediest in its class up Cairnwell and round the Devil's Elbow. It has a horizontal opposed double-cylinder engine, with change-speed gear of the planetary type, giving two speeds and reverse, the final drive being by a single chain on to a live axle. On Tuesday we had a run out on the car, with Mr. Gordon Sharp at the wheel, and were much struck with its quiet and vibrationless running. The outline of the body gives it a good appearance, and the advent of the Reo to the British market adds to the selection of desirable cars at a moderate price. The 16-h.p. is fitted with a tonneau body, and the 8-h.p. is a two-seated vehicle with a rear folding seat, useful when a third passenger is to be carried. Reverting to the new dépôt in Broad Sanctuary, Westminster, here the Reo Motors, Ltd., will have ample garage and workshop facilities, and will carry a full range of spare parts, so that purchasers of cars therefrom will experience no delay in securing replacements. Such, however, are not likely to be in great demand, the workmanship of the car being of no ordinary calibre.

CAUTION boards have been erected at Ranvilles Corner, near Romsey, on the London to Bournemouth road, by Messrs. Mitchell Bros., of the Romsey Motor Garage.

WE learn from the London and Parisian Motor Co., Ltd., that the Hotchkiss Co. are building a large number of 10-14-h.p. four-cylinder motor-cabs for service in Paris.

MR. ERNEST B. VOISIN informs us that the 7-8-h.p. Swift purchased by him a year ago has been running continuously without trouble, covering from ten to twelve thousand miles.

MR. HENRY MOORE, of Brighton, has driven his 16-20-h.p. Argyll, fitted with the Moseley Perfect tyres, 2,879 miles in the course of the daily runs he has been making during the season.

A NUMBER of non-commissioned officers and men of the 3rd Battalion Coldstream Guards have sat for the A.C.G.B.I. examination. This is now being held every Wednesday at 119, Piccadilly, W.

THE L.G.B. inquiry into the application of the Carnarvon County Council for the limitation of the speed of motor-cars to ten miles per hour in the district lying west of Vaughan Street, Llandudno, will be held on the 12th prox.

THE Battle Urban Council has appointed a special committee to draw up particulars of dangerous spots in the locality where the speed limit for motor-cars ought to be reduced, the suggestions to be afterwards forwarded to the county council.

THE Lancashire Steam Motor Co., of Leyland, has lately completed a 35-40-h.p. double-deck bus for public service in the Orkney Islands. The body has a seating capacity for forty passengers, and is so designed that no conductor is required, the entrance being towards the front end, near the driver.

SEVERAL folding screens for motor-cars have been brought out by Messrs. Lowe, Bevan and Co., of Birmingham. Their "Metallic" folding wind screen has a frame constructed entirely of metal, and is fitted with their patent Simplex fittings. These screens are of the folding type, and characterised by neatness of design as well as by excellent workmanship.

A DUST-SCREEN known as the "Quick Fit," and much seen upon the roads during the season now closing, is that shown in the accompanying illustration. It is specially designed for cars with tonneau bodies, the intention being to overcome the difficulty of passengers alighting when a screen is in use. There is only one thumb screw forming the attachment, and this should be arranged so as to come in line with the back hinges as nearly as possible. The two bottom ends of the screen

are merely buttoned by straps to two buttons on either side of the tonneau body. Exit or entrance is provided by undoing the left hand button, and when the door is opened the whole half of the screen comes back with it, as shown in the illustration. After taking a seat in the car and closing the door all that the passenger need do is to pull a strap round the tonneau, fastening it on the button on the side, when the screen will assume its normal position for combating the dust that rises from our roads. Messrs. Gamage are putting it on the market.

Letters to the Editor should be addressed to the offices,  
87-88, Charing Cross Road, W.C.]

### THE SUPPLY OF PETROL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Messrs. Thompson and Hunter, the well-known petroleum mining experts, have lately prepared for me a report on the output of crude oils throughout the world, and they have specially noticed the petrol question. With their kind permission I am giving a few extracts from their report, which may be of interest:—

The following are the figures relating to motor spirit (nominated benzine in the official returns) imported into the United Kingdom during the last two and a half years, giving also the country of origin of the large amounts:—

	1904.	1905.	1906.
	Imperial	Imperial	(6 months)
	gals.	gals.	Imperial
			gals.
United States ... ..	5,960,701	10,409,200	5,591,140
Sumatra and East Indies (except			
Borneo) ... ..	4,420,250	7,827,930	2,069,410
Roumania ... ..	980,000	—	591,980
Borneo ... ..	—	—	4,369,450
Other countries ... ..	611,508	421,261	8,160
	11,972,459	18,658,391	12,630,140
1906.—Half year, 12,630,140 imperial gallons; one year, 25,260,280 imperial gallons.			

We had only yesterday an interview with a distinguished Wall Street merchant who is acquainted with the oil business of the United States, and he affirms confidently that the shortage of motor spirit is so great in America that it will be necessary to import it into the country before long unless new oil fields yielding oil of a lighter grade are found very soon. At the moment, spirit is only exported from America, as the land freights far exceed those of water. The bulk of Californian petroleum yields scarcely any benzine, and the same can be said of the majority of Texas oils, so that our chief sources of supply must be looked for from the East Indies and Roumania. Roumania is not a reliable source, as Germany and Austria, being near neighbours, will naturally import the spirit in large quantities as the motor trade develops.

Summarising, we find that American supplies of light spirit are diminishing, and likely to disappear; the Russian is scarcely worth consideration, and Roumanian and Galician outputs are likely to be entirely consumed by Austria and Germany, leaving the East Indies together with certain small oil fields, whose joint output of crude is but 7·2 per cent. of the world's supply, to furnish Great Britain and Western Europe with spirit. The imports of benzine into Great Britain were about 56 per cent. more in 1905 than in 1904, and the last half year's return indicates that the total imports this year will far exceed 25,000,000 gallons. An almost corresponding increase in demand will arise in other countries of Western Europe.—Yours truly,  
A. DUCKHAM.

### A CAR FOR DOCTOR'S USE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to Dr. Oliver Smithson's letter, I should strongly recommend a 10-h.p. Turner-Miesse steam car as being most suitable for his requirements. Speaking from my own experience, I have driven my car about 3,000 miles and have never had a mishap or breakdown of any sort whatever. It is quiet, free from vibration, smokeless, and is also most economical to run, as my expenses work out at slightly less than 4d. per mile. This does not include tyres, of which I have just bought a new pair for the back wheels. I have had only two punctures, although the roads in my district are very loose. Apart from tyres I have not spent a penny in repairs, and I think the car goes better than ever.

A new burner regulator has just been brought out, by means of which the furnace can be turned up or down like a gas stove, so that the car can be kept waiting about and yet be ready to start at a moment's notice. I look after the car myself and give it reasonable attention, and, as I said before, have never had a breakdown of any sort or spent a penny in repairs.—Yours truly,  
BJ-72.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I want a small light four-cylinder car, reliable, silent, flexible engine, about 10 or 12-h.p., side entrance, with neat body and as short a wheel base as possible, length over all about eleven feet. If any of your readers would kindly give me the name of a car meeting the above

requirements, I would feel greatly obliged. The 10-12-h.p. Rover and the 10-12-h.p. Coventry Humber are too big for my purpose.—Yours truly,  
M D., BELFAST.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR.—I notice in the *M.C.J.* of the 18th inst. Mr. Smithson complains about the noise made by petrol cars. Surely if he had an up-to-date car this complaint would not be possible. I am driving an 8-h.p. two-cylinder car which will average, with four up, 22 miles per hour on give and take roads, and is as silent as any four-cylinder car.—Yours truly,  
G. H. WAIT.

### THE TENTH EMANCIPATION ANNIVERSARY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In this year falls the tenth anniversary of Motor-car Emancipation Day (November 14th, 1896) and the repeal of the prohibitory statutes.

The occasion ought not to pass unrecognized, and we suggest a gathering limited to the pioneers of November 14th, 1896—a gathering essentially in the nature of a family party for the re-telling of old tales and not for purposes of advertisement.

If our idea finds a responsive echo in the hearts of the gentlemen referred to, will they communicate with us to Dacre House, Arundel Street, Strand, expressing their willingness to participate and making suggestions as to a fitting form of celebration? A small working committee will, of course, be needed.—Yours truly,  
C. McROBIE TURRELL.  
CHAS JARROTT.

Mr. H. Graystone, off Hay, Herefordshire, on his 25-38-h.p. (Spyker Car).

### DUSTLESS ROADS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to your paragraph upon the subject of the Dustless Roads Association in your last issue, I think that if you duly appreciated our objects and methods you would agree that no other body is doing the work we have set out to do and would endorse our claim upon the support of motorists.

At present the public are content to abuse motorists as solely responsible for the dust nuisance. But what if the whole weight of public opinion were directed to the true remedy, the provision of roads suitable for modern traffic conditions? Our object is to lead the public to view the matter in that light and to afford them opportunities in each district throughout the country to actively agitate for the application of the real remedy. It is perfectly true that the Roads Improvement Association and other organisations are doing good work, but not this work; and they are all ineligible to undertake it, for the simple reason that they are motorists' associations. Even the R.I.A. is handicapped by reason of their secretary being the motorists' very worthy champion. It is clear that the movement we have initiated can only be conducted by a peoples' association. Our mission is, briefly, to organise the public to bring pressure to bear upon the road authorities with regard to the making and upkeep of the roads. Other bodies may be supplying those authorities with the necessary technical data, but no other association is attempting, nor qualified to attempt, to turn into a useful channel the enormous force now awaiting utilisation. It can, of course, be appropriated by the Anti-motorist Highways Protection League, but are you content that this should happen?—Yours truly,  
CHAS. F. VAUGHAN, Hon. Sec.

[We shall be pleased to receive the names of the committee of this Association and a copy of the rules and other printed matter, to add to

our library of the literature of Associations. Unfortunately Mr. Vaughan's letter is vague, and his efforts lack the practical nature of the work of the existing societies which, by experiments, are really educating the authorities and the public.]

### THE REPORT OF THE ROYAL COMMISSION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—If the taxes are increased as proposed, I for one shall have to give up motoring. There is a limit that one must abide by, and to pay five guineas annually for a small car is past my limit, and I consider it will be a heavy blow to manufacturers. Tyres are bad enough, then the rise in petrol adds up also, and it will decide many a prospective motorist not to be one.—Yours truly,

LIMITED.

### STARTING ON THE SWITCH.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—There is much of interest to motorists in your correspondence column of the *M.C.J.* of the 11th inst. I am sure motorists generally will be pleased to know of any genuine improvement in the direction of silence, sweet running, and economy of fuel. I know of a car in my district that has been made to start practically always on the switch that never would before, even when delivered new, made ever so much more silent and elastic or flexible. Also another with magneto ignition, which would never start on the magneto, but which now starts on first half turn. In both cases the result is obtained by a most simple little device. Still another has a much-improved brake which is more certain in action both ways and leaves the driver's hands free for management of the steering wheel in case of need. The arrangements are undoubtedly of great interest to all motorists, and are fitted by a very modest motor mechanic, who

The New Arrol-Johnston 24-30-h.p. double Landulet, which in all accommodates nine persons, seven inside and two on the driver's seat.

does not, I am afraid, possess that egotism of making a big noise about an improvement, however meritorious. His place is quite a modest one on the Bawtry Road, Doncaster, and I think, without exaggeration, motorists will find there something to be obtained to their general advantage.—Yours truly,

ONE WHO BELIEVES IN GENUINE MERIT.

### BRAKES FOR MOTOR-BUSES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The writer of the letter in the *M.C.J.* of the 11th inst., signed R. Henderson, may be interested to know that his suggested arrangement of motor-bus brakes is already used on the Pioneer vehicles. Another point is that although no cable is used with this brake its compensating action may be safely relied upon. I believe the only good quality a cable brake is supposed to possess over rigid connections is that it is "compensating." My opinion is that after being in use a short time the cable beds itself and does not give one way nor the other. Possibly some reader can give some information on this matter.—Yours truly,

H. B. K.

### A NOVEL SUGGESTION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I do not know if many motorists have a large scrap heap. If their experiences coincide with mine they must have many souvenirs of pleasant roadside stops, and of interesting hours spent in the motor pit or in some such comfortable position, removing defective parts, &c. Now my object in writing is to suggest that a special exhibit might be organised at the next show at the Agricultural Hall, at which private owners of cars be invited to show spares or old parts illustrative of the merit or the reverse of their respective automobiles. Personally I can contribute a crank which broke after the maker's guarantee had expired, also a clutch fork made of gun metal which opened out after three

weeks' use, a cast change-speed lever, a gun metal gear striker and many other examples doubtlessly worthy of exhibition as samples of "British engineering." I enclose my card and remain,—Yours truly,

A MEDICO MOTORIST.

### SELF-STARTING DEVICES FOR PETROL CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—What has become of the many self-starting devices for petrol cars of which so much was heard on the occasion of the last Paris Salon? At that time it looked as if a self-starting boom was setting in, but it seems to have fizzled out quickly, and the motorist still has in the majority of cars to go through the operation of starting the engine by means of the handle in front before climbing into his seat, just as his predecessor did ten years ago, when the petrol vehicle first began to assume encouraging proportions. It is true, of course, that many motors of the multi-cylinder type can be relied upon to start on the switch, but the time is evidently ripe for the inventor and the designer who is of an inventive turn of mind to bring out a simple and effective self-starting arrangement for single and double-cylinder cars.—Yours truly,

W. H. HARRIS.

### SPEEDOMETERS FOR THE PUBLIC.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—So many variations with regard to the speed of motor-buses appear in evidence at the London police courts that it is becoming increasingly necessary to have speed indicators fixed in such a position that drivers and conductors may know when they are exceeding the legal limit of speed. Everyone knows the difficulty of gauging the rate of travel, and this is not decreased when the person making the estimate is seated on the car driving. In London traffic, with its constant halts, each providing a strain on the nerves of the drivers, it is almost impossible to expect the driver to know if he is going too fast.

Cannot the public be let into the secrets of speed and a corresponding dial shown within the bus, so that both driver and public may know the rate of travel? Or, failing that, could not we have a speed indicator with a face on the obverse side? If this were fitted on the dashboard the driver would find it useful, while passers by might catch a glimpse of the speed, and so tend to check the illegalities of the drivers—illegalities often unintentional.—Yours truly,

W. B. RIDER.

[The idea suggested by our correspondent has been anticipated by Messrs. S. Smith and Son, who have brought out a speedometer for the dashboard with the face indicating the speed to the driver, and a "telltale" dial facing the public.]

### A DE DION CAR QUERY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have a two-cylinder 12-h.p. De Dion car, with expanding clutches. The car runs well with light load, say two passengers, on level or hilly road, but with five passengers the engine seems to lose power on hills and sometimes starts knocking, although racing on the level. The compression is perfect, lubrication all right, batteries new, non-trembler coil new; in fact, the engine seems to run as good as new when the car is standing. The striker for the make and break on the contact breaker rocks slightly and the cams are slightly worn. Would this have any effect? I should be delighted if any kind friend would help me out of my difficulty.—Yours truly,

E. B. D.

[We should imagine our correspondent's trouble to be due to the worn cams, as he suggests. No doubt, if these be renewed, the sluggishness will be overcome. It would also be advisable to somewhat tighten the contact breaker, as this might not give good contact at a slow speed, although at high speed the contact may be perfect.]

### MOTOR CARS ARRIVING IN ENGLAND.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As a subscriber of your journal, may I ask you to inform me whether steps are necessary for legalising my car on landing in England, as I hope to drive from here (Barcelona) in a few weeks' time? I refer to such matters as number, licence for driving, and how to arrange as regards duty (if any), that such may be refunded on leaving the country again.—Yours truly,

BARCELONA.

[Cars have to be registered and drivers licensed in the ordinary way. No duty is payable.]

SOLS PETROS.—The inquiry in our issue of the 11th inst. has elicited the information that this is supplied by Mr. George Dean, Foley, Longton, for the prevention of incrustation of boilers.

HOW ACCIDENTS OCCUR.—The Canford Cliffs Motor Omnibus Company, Limited, Bournemouth, write:—"Referring to the letter on the above subject appearing in the last issue of the *M.C.J.*, as our cars cover a portion of the route between Bournemouth and The Sandbanks, and have done for close upon seven years, we ask for an opportunity of saying that the car E.L. 316 is not owned or run by this company."

## THE CARE OF PNEUMATIC TYRES.

By F. J. J. GLYNN.

I THINK a note of warning should be given to motorists concerning the use of their pneumatic tyres, as it is apparent from the writer's observation that they are not doing all they could do to preserve the life of the same and get adequate service by so doing. The writer's experience in connection with tyres is a long one, and dates from the inception of the general use of pneumatics, and from his observations the remarks he is about to give apply to all makes—and none in particular—of motor tyres; and his only hope is that they will be of pecuniary benefit to automobilists, as well as removing a great deal of misconception that exists in their minds as to the cause of the premature failure of tyres.

The fundamental principle of the pneumatic tyre is to hold compressed air of such a volume that it will support the walls and maintain its circular shape in the transverse direction when carrying a load. The accepted method of obtaining this result when the tyre is applied to the wheels of an automobile, is to employ five components:—The rim, the air-chamber and valve, the cover, and the security bolt.

**The Rim.**—The standard rim used on automobiles throughout the world is designed to securely hold the cover by the beads or lugs on same, and for that purpose it has inturned edges or lips. The rim is manufactured of steel and forms the periphery of the rigid part of the wheel, whether made up in the "Artillery" pattern or with wire spokes.

The air chamber is an annular tube of india-rubber with a non-return valve. It is elastic and expansible in all directions, and is only held within circumscribed limits—when under the process of inflation and after—by the inextensible cover or envelope as fitted to the rim. Its purpose is to contain the compressed air, and for that reason the india-rubber must be of such a quality that it will keep air tight when inflated. The non-return valve is fitted into the air-chamber, so that by its medium the air can be introduced, and when fully compressed it will not leak from within the air-chamber, and thus reduce the efficient air pressure which supports the load carried by the tyre.

The cover or envelope is annular in its circumferential direction and is arch-shaped in its section, having beads or lugs which fit into the inturned edges or lips of the rim. It is composed of fabric and india-rubber. The method of construction and selection of materials is all important in the production of a successful motor tyre. The fabric is generally of woven cloth, the threads of which are of such strength and character that when sufficient layers, or plies, of cloth are superimposed upon one another, they will withstand the air pressure within; transmit the power developed by the engine into locomotion; and resist the frictional wear of the threads upon one another, so that adequate service may be obtained by its use. The employment of rubber is supplemental in a sense; alone it would be useless as a pneumatic tyre, for by reason of its elasticity in all directions air could not be sufficiently compressed within it to support the load that a tyre has to carry when used with an automobile. India-rubber is used with a cover so that the various plies of fabric shall be homogeneous with one another, and as a sheath to the fabric to protect it from the wear of the road.

**Security Bolts.**—Besides the rim, the air-chamber, and the cover, security bolts are employed. These bolts have an elliptical or elongated mushroom head covered with leather, and the shank of the bolts passes through holes in the base of the rim with the mushroom head of the bolt inside the cover. To the other end of the bolt "butterfly" or winged nuts are provided, so that when the tyre is fully inflated the winged nuts are screwed tightly towards the base of the rim, and thus clamp the edges of the cover securely thereto and prevent the cover from "creeping" or moving in a circumferential direction in the rim, when the power is being transmitted to the road wheels.

The foregoing explanation of the components of a pneumatic motor tyre is made so that the reader may realise the functions of the various parts. Taking each unit separately, he must admit that they have every appearance of being fragile, when the work they are put to is considered. But the possibilities of design and manufacture accomplished by some makers of motor tyres has overcome this apparent frailty, and when properly used in combination, they form the most efficient and economical method of tying a wheel yet placed before the automobile world. However careful the manufacturer may be in the selection of the materials and the workmanship, it finally remains with the user to maintain the efficiency of the tyre so that adequate wear shall be obtained. The writer, from his long and intimate experience of tyres and their users, regrets to have to state that motorists are very negligent in the upkeep of their tyres, and fail to give the necessary simple attention to them when most needed. The simplest and easiest attention to tyres is to see that they are sufficiently inflated, and amongst tyre manufacturers it is an established fact that 98 out of 100 causes of premature failure in pneumatic tyres is traceable their having been used insufficiently inflated.

When working under a load the walls of the tyre need to be supported by a volume of compressed air within, so that it will not lessen the curvature of the tyre at its point of flexion and make a sharp curve; if so, the threads of the fabric will unduly rub in frictional contact with one another, and prematurely saw themselves through, and weaken the tyre to such an extent that a burst is inevitable, whereas, if a correct pressure of air had been maintained within the tyre, the threads would not have rubbed themselves through at the points of

flexion, and there would not have been any acute curvature in any part of the tyre. Motorists are not purposely negligent, but theoretically they are. They honestly believe they have sufficient air pressure in their tyres because they do not show any undue deflection when standing. A very small pressure of air to the square inch will prevent the tyre "bulging" when standing or running over a smooth surface, and they forget that when passing over unequal surfaces the tyre is continually withstanding the force of severe impacts which momentarily flatten the tyre to an abnormal degree, and these impacts occur so frequently and rapidly that the fabric at the point of flexion wears out as much in ten miles as would have carried it one hundred miles if correctly inflated. Besides, when under inflated the threads of the tyre are in unequal tension to transmit the power into locomotion and those threads, few or many as the case may be, that are in greatest tension do all the work and prematurely break through overstrain, after which additional work is thrown on the other threads, and in their turn they are unequal to the task, and break, causing a burst.

One naturally asks, "How am I to ascertain if I have the correct pressure in my tyre?" The pump I use has a pressure gauge, and surely that is sufficient?" The reply is, "There is not a more fallacious method of ascertaining the pressure within the tyre than having a pressure gauge at the pump end of the flexible connection. It only registers the pressure that is momentarily made at the end of the stroke when pumping, and does not indicate the pressure inside the tyre. Ninety-eight out of one hundred motorists are using their tyres under the honest belief that they have 70 lbs. to 80 lbs. pressure to the square inch, when they really have anything from 15 lbs. to 20 lbs. less.

The only accurate means of verifying the pressure in the tyres is to use an instrument such as the "T. and M. Tyre Tester," which has come to the writer's knowledge, and he has obtained from the manufacturers an illustration which is reproduced herewith.

The device has a Schaffer and Budenberg gauge (D) registering with undoubted accuracy, and it has a union (B) to attach to the

tyre valve in the same way as the flexible pump is attached. A pin (E) having at its end a milled nut (C) passes through a stuffing box and lifts the stem of the plunger in the valve proper by turning the milled nut from left to right. Directly the pointer in the gauge has moved from zero, just give a half-turn of the milled nut C and the valve is completely open, and the gauge then accurately registers the pressure per square inch within the tyre. Do not continue turning the milled nut C after this, as you are likely to bend the stem of the valve plunger and thus cause a bad seating and subsequent escape of air through the valve. Should the pressure of air not be sufficient, according to the table of pressures issued by each tyre manufacturer, within the tube, then attach the nozzle of the flexible pump connection to the supplemental non-return valve A and inflate in the ordinary way. As the pressure increases, the gauge will indicate the same during the process of inflation, and when you have obtained sufficient pressure turn the milled nut C from right to left, so as to permit the plunger in the valve proper to obtain its seating. Remove the tester from the valve and refit all the pieces of the latter, and you have accomplished a correct pressure within the tyre.

The tyre should not be over-inflated, as it is nearly as bad as under-inflation. It puts an undue tension on the threads of the fabric, bringing them very near their "breaking point," and then one has only to let in the clutch violently a few times to cause a rupture of the fabric. With this clever device a motorist can test his tyres every day, or as many times a day as he likes according to the development of his bump of carefulness—with very little trouble, for such a little time is needed that it should never be neglected—and the time spent means a considerable saving of £ s. d. in the tyre bill at the end of the year. After the introduction of this device there will be no excuse for motorists if they use their tyres incorrectly inflated, and tyre manufacturers cannot be blamed if they attribute negligence in the use of a tyre, should they show signs of want of inflation, or over-inflation, and repudiate any responsibility. Motorists will be safeguarding their interests by its use, and there will be less complaints generally of premature failure in motor tyres if motorists will see to it themselves daily that correct pressure is maintained.

## CLUBS AND ASSOCIATIONS.

### NOTTS A.C.'S HILL CLIMB.

ON Saturday the Nottinghamshire Automobile Club held a successful hill climbing competition at Hazlewood Hill, which was policed by Captain Holland, the Chief Constable of Derbyshire—an act much appreciated by the organisers. The arrangements were of the admirable nature invariably associated with the gatherings of the Notts Automobile Club, and reflected great credit upon Mr. Booth Granger, the hon. secretary. Mr. Charles Hardy, the president, acted as judge, Mr. A. R. Atkey as starter, and Mr. G. H. Kirk as clerk of the course, while Messrs. Albert Osborne and H. Perry were the timekeepers.

There were two sections, the first being the handicap and the second a racing section, in which the prize was awarded to the car doing the actual fastest time up the hill. In the former the best performance was that of Mr. F. A. Bolton, whose 35-45-h.p. Daimler tore up the hill in 1 min. 12-5 sec., or ten seconds faster than was accomplished by any other competitor in the same class. Another Daimler, driven by Mr. W. M. Hutchinson, and of 30-40-h.p., was the nearest to this, the time recorded being 1 min. 23-5 sec., while Mr. J. Doran, on a 22-h.p. Minerva, came third with 1 min. 48-2 sec., and Mr. J. Truman, on a 28-36-h.p. Daimler, fourth with 1 min. 58-1-5 sec.

The following are the details of the events:—

Owner.	Car.	Time.	
		Min.	Sec.
F. A. Bolton...	35-45-h.p. Daimler	1	12-5
W. M. Hutchinson...	30-40-h.p. Daimler	1	23-5
J. Doran...	22-h.p. Minerva	1	48-2
J. Truman...	28-36-h.p. Daimler	1	56-1-5
R. Cripps...	16-20-h.p. Argyll	2	28-1-5
H. Belcher...	16-20-h.p. Humber	2	35-2-5
Dr. R. G. Hogarth...	12-16-h.p. Clement-Talbot	2	44-2-5
G. H. Kirk...	16-20-h.p. Richard-Brasier	2	58-4-5
Spencer Downing...	10-h.p. Alldays and Onions	3	46-3-5
R. S. Clifford, jun.	12-h.p. Georges Richard	4	55-4-5

#### FASTEST TIME.

Cecil Edge	90-h.p. Napier (first run)	1	4-1-5
	(second run)	1	0-1-5
F. A. Bolton	35-45-h.p. Daimler (first run)	1	6-4-5
	(second run)	1	6-1-5
J. Doran	22-h.p. Minerva (first run)	1	23-4-5
"	" (second run)	1	22-3-5

### AERO.

THE Aero Club has issued the preliminary rules governing the long distance prize given by Miss Krabbe for competition during the autumn months of this year. It will be given to the competitor who, in a single trip, covers the greatest distance. This must be traversed over Great Britain only.

### KENT.

ONCE again the members of the Kent Automobile Club enjoyed the hospitality of their President, Sir David Salomons, at his residence, Broomhill, Tunbridge Wells. The weather fortunately kept fine and a very large number of members were present. Sir David Salomons presented the prizes obtained at the recent hill climb and gymkhana and also the gold medal awarded to Mr. T. H. Nash by this club for the special certificate for mechanical proficiency obtained by Mr. Nash at the Automobile Club's examination held at Maidstone.

After the presentation of the prizes some interesting pictures were shown on the cinematograph of the earthquake at San Francisco and also of the eruption of Mount Vesuvius. Then the members were invited to stroll about the beautiful grounds and also to inspect the stables and motor houses and workrooms, in which there are scientific instruments and tools of every kind.

Among those present were the following:—Dr. Firth and Mrs. Firth, Sir Alfred and Lady Watkin, Col. Henderson, Mr. and Mrs. J. W. Orde, Mr. and Mrs. Bernard Arnold, Mr. and Mrs. Preston, Mr. and Mrs. Huntly Walker, Mr. and Mrs. Shirley Price, Mr. and Mrs. Waddington, Mr. and Mrs. C. J. Morgan, Mr. and Mrs. Nash, Miss Nash, Mr. and Mrs. Austin, Col. E. Latter, Mr. and Mrs. Martingell, Mr. and Mrs. Darwin, Mr. and Mrs. Gardner, Mr. E. B. Gardner, Miss Queenie Arles, Dr. and Mrs. Dowding, Mr. and Mrs. Wright, Mr. and Mrs. Laslett, Mr. and Mrs. Symmonds, Mr. Crook, Mr. and Mrs. Batchelor, Mr. and Mrs. Baily, Mr. and Mrs. Killick, Mr. H. W. Killick, Mr. E. and Mrs. St. John Brice, Mr. and Mrs. Johnson, Mr. and Mrs. White, Rev. Cotton, Mr. H. Cosh, Mr. W. Stevens, Mr. and Mrs. Bolton, Dr. Holroyd, Mr. and Mrs. Shrubsole, Mr. Neate, Mr. Granville Kenyon, hon. sec., and Mrs. Kenyon.

### LINCOLNSHIRE.

THE Syston Park Hill Climb, promoted by the Lincolnshire A.C., was favoured with fine weather on Saturday last. Sir John Thorold had granted the club the use of his picturesque park, and the stiff hill along the private road made a capital spot for the trials. The total distance of the hill was about 660 yards, with an average gradient of 1 in 9-5, and a maximum gradient of 1 in 7. The meeting attracted motorists from all parts of Lincolnshire and adjoining counties, and from 300 to 400 people watched the events. In addition to prizes offered in three events special prizes were also awarded. The handicapping formula proved very satisfactory and everybody spoke highly of it. Appended are the results:—

CLASS A.—For cars not exceeding 10-h.p.

Name.	Make of Car.	Handicap figures.	Time-sec.	Marks.
*Sir Hickman Bacon	6-h.p. Wolseley	205-0-4		= 225-
+Dr. E. H. Cragg	Baby Peugeot	211-1-5		= 197
{Mr. G. E. Sanders	4½-h.p. De Dion	211-1-5		= 172
{Mr. J. E. Withers	6-h.p. Wolseley	211-1-5		= 172
Dr. White...	6-h.p. Wolseley	211-1-5		= 158
Dr. F. W. Mason	7-9-h.p. Peugeot	211-1-5		= 147
Dr. Stitt-Thomson	8-h.p. De Dion	211-1-5		= 141
Mr. P. H. Mays	8-h.p. Cottereau	211-1-5		= 140
Mr. C. Vincent-Smith	7-h.p. Swift	211-1-5		= 134
Mr. W. B. Parish	6-h.p. Rover	211-1-5		= 112
Mr. R. Purves	De Dion	211-1-5		= 112
Dr. W. F. Miller	7-h.p. Peugeot	211-1-5		= 110

\* Winner of first Club prize, also the Newsam Challenge Cup for the best performance on the handicap.  
† Winner of second Club prize.

CLASS B.—For cars not exceeding 20-h.p.

*Mr. T. W. Mays	10-12-h.p. Humber	118-0-0		= 160
+Mr. W. B. Jevons	10-12-h.p. Humber	118-0-0		= 158
Mr. B. Gibson	12-h.p. Richard-Brasier	118-0-0		= 153
Mr. P. Wright	10-12-h.p. Humber	118-0-0		= 151
Mr. E. M. Symson	10-12-h.p. Humber	118-0-0		= 139
Mr. T. W. A. Damon	10-12-h.p. Humber	118-0-0		= 135
Dr. W. J. Gilpin	12-h.p. Richard-Brasier	118-0-0		= 153
Mr. W. A. Tomlinson	10-12-h.p. Humber	118-0-0		= 132
Mr. W. J. Newsam	15-h.p. Panhard	118-0-0		= 122
{Mr. W. J. Gent	10-h.p. National	118-0-0		= 106
{Rev. T. A. Stoodley	10-h.p. De Dion	118-0-0		= 106
Rev. M. C. Wilkins	10-12-h.p. Argyll	118-0-0		= 86

\* Winner of first Club prize; also the first prize offered by the Humber Company.  
† Winner of second Club prize and second prize offered by the Humber Company.

CLASS C.—For cars exceeding 20-h.p.

*Capt. H. E. Newsam	35-45-h.p. Daimler	118-0-0		= 175
+Mr. A. A. Padley	16-20-h.p. Humber	118-0-0		= 155
Major J. A. Cole	16-20-h.p. Humber	118-0-0		= 151
Sir Hickman Bacon	18-h.p. Wolseley	118-0-0		= 145
Major F. H. Goddard	16-20-h.p. Clement-Talbot	118-0-0		= 115

\* Winner of first Club prize, also the Lincoln Member's prize for making the actual fastest ascent.  
† Winner of second Club prize.

At the close of the contests, Lady Thorold presented the prizes to the successful competitors. She said she did not know much about motor-ing, but it gave Sir John and herself much pleasure to have them in the park, and they had been much interested in what they saw. On the motion of Sir Hickman Bacon, seconded by Major Cole, Sir John and Lady Thorold were thanked for their assistance. Dr. Gilpin was an ideal secretary of the meeting, and others who assisted were:—Starter, Mr. W. R. Pennell; timekeepers, Messrs. T. Chambers and T. E. Foster; clerks of the course, Sir Hickman Bacon, Major Cole, Mr. A. A. Padley, and Mr. C. W. Pennell; marshal, Capt. C. J. F. Parker.

### LIVERPOOL AND MANCHESTER M.C.

MOTOR-CYCLING matches between teams representing the Liverpool and Manchester Motor Clubs were held on the New Brighton track on Saturday. Eight heats each with two competitors were run, and in seven the Liverpool rider was successful, that team being adjudged the winner. The best time over the two mile course was made by J. Edge on a 5-h.p. Vindec.

### IRISH MOTOR UNION SPEED TRIALS.

The Dublin centre of the Motor Cycle Union of Ireland held the third of the season's speed trials on Saturday at Portmarnock. A suitable course was selected for the ten miles handicap, a stretch of sand half-a-mile long being worked out, over which the competitors rode on the out-and-home principle, and thus covered the required ten miles. The Wheatley Bowl, the principal item on the card, was won by C. B. Franklin, the holder, who now retains the cup by virtue of the third win in succession, his mount on this occasion being the 8-h.p. J.A.P. which he rode in this year's International contest; the time returned is not a fair indication owing to the presence of some three water cuts crossing the stretch of sand on which the straightaway mile course was mapped.

out for this event. The arrangements were up to the usual standard, and the times were taken by Messrs. T. W. Murphy and Colman O'Connell, and the former started. Appended are the details:—

One Mile Novice Handicap.

No.	Name.	Cycle.	sec.
1.	E. Hurse...	2½-h.p. F.N.	15
2.	E. Cannon...	2½-h.p. Minerva	20
3.	C. Kavanagh...	3½-h.p. Morehampton	5
4.	E. Bannister...	4-h.p. Minerva	scratch

Won by five yards; a good third. No time returned.

One Mile Members' Handicap.

No.	Name.	Cycle.	sec.
1.	E. Hurse...	2½-h.p. F.N.	20
2.	W. H. Guilfoyle...	2½-h.p. Minerva...	20
3.	B. Dumphy...	2½-h.p. Minerva	10
	C. Kavanagh...	3½-h.p. Morehampton	scratch
	W. Jacques...	3-h.p. Alecyon	scratch
	C. B. Franklin...	3-h.p. Triumph	scratch
	A. J. Armstrong...	3½-h.p. Swallow	5
	J. G. Drury...	3-h.p. Triumph	5
	C. G. H. Lewis...	2½-h.p. F.N.	5
	R. Howison...	2½-h.p. F.N.	10
	E. Cannon...	2½-h.p. Minerva	15
	W. Ladley...	2-h.p. Morehampton	30

Won by ten yards, five yards between second and third. No time returned.

MOTOR RACES AT SKEGNESS.

THE date selected for this year's meet of the Nottingham Automobile Club at Skegness is Saturday, the 8th prox., when the tide will leave a good clear hard track, and a most interesting programme has been arranged.

The appearance competition will be held in the morning, at 11.30, on the promenade, the races commencing at two o'clock. The kilometre handicap for the Wilson cup, run at Welbeck on May 5th, is to be re-run as a mile kilometre race.

Entries close on Saturday, September 1st, to Mr. Booth Granger, hon. sec. of the Notts. Automobile Club, 12, Beastmarket Hill, Nottingham. A very efficient staff of officials have already been elected, and a strong committee has been formed at Skegness, with Mr. S. Coetmore Jones, Earl Scarborough's estate agent, who did so much for the meeting last year, as chairman.

MOTOR GYMKHANA AT SAXMUNDHAM.

ON Wednesday of last week a motor gymkhana was held at Hurts Park Hall, Saxmundham, in aid of the Soldiers' and Sailors' Help Society. Miss Forster, the hon. secretary of the East Suffolk branch of the society, enlisted the help of Captain F. Vernon Wentworth, R.N., and Mr. W. A. Milner-Gibson, who arranged a programme of seven events. The judging was undertaken by Lord Rendlesham, Lord Huntingfield, Sir Fredk. Adair, Bart., and General Sir Ronald Lane

The Argyll Cab on the Boundary Bridge between England and Scotland, near Gretna Green.

Ten Miles Go-as-you-please Handicap for Shaw Cup.

No.	Name.	Cycle.	min.	sec.
1.	C. G. H. Lewis...	2½-h.p. F.N.	(45 sec.)	18 0
2.	H. Quinn...	3-h.p. Triumph	(2 min.)	20 3
3.	C. B. Franklin...	3-h.p. Triumph	(scratch)	18 41
	W. Jacques...	3½-h.p. Alecyon	(20 sec.)	—
	C. Kavanagh...	3½-h.p. Morehampton	(30 sec.)	—
	J. A. Armstrong...	3½-h.p. Swallow	(1 min. 40 sec.)	—
	W. H. Guilfoyle...	2½-h.p. Minerva	(2 min.)	—
	R. Howison...	2½-h.p. F.N.	(2 min. 30 sec.)	—
	R. Hurse...	2½-h.p. F.N.	(3 min.)	—
	W. Ladley...	2-h.p. Morehampton	(3 min. 30 sec.)	—

One Mile Scratch Wheatley Bowl (holder, C. B. Franklin).

No.	Name.	Cycle.	min.	sec.
1.	C. B. Franklin...	8-h.p. J.A.P.	1	18 4-5
2.	C. Kavanagh...	3½-h.p. Morehampton	1	25 3-5
3.	J. G. Drury...	3-h.p. Triumph	1	27 2-5
	W. Jacques...	3½-h.p. Alecyon	—	—

"M.C.J." PRIZE COMPETITION.

WE offer prizes for the best Limericks of automobile interest. They should preferably refer to a motor-car, motorist, or Association, and reach the office not later than the 27th inst. Further particulars appear on page 537.

K.C.V.O., C.B. Besides Captain Wentworth and Mr. W. A. Milner-Gibson, the duties of marshals also fell upon Colonel Sir Richard Martin, K.C.B., Mr. W. E. Long, Capt. W. Wilmer, and Lieut. Mure, R.N.

In the coach-house competition Mr. E. R. Holland won on an 8-h.p. De Dion, Mr. A. S. Garrett (8-h.p. Alldays) being second. Mr. J. A. Cooke, on a 16-h.p. Isotta Fraschini, was successful in the passenger race, Mrs. C. S. Bowyer (16-20-h.p. Argyll) being second. Mr. F. Garrett (8-h.p. Alldays) took first prize in the bending contest; Mr. J. A. Cooke in the starting and stopping race; and Mr. A. S. Garrett in the balancing competition. The programme concluded with musical chairs, the nine competitors including Mr. W. Milner-Gibson, on his 28-36-h.p. Daimler. The first prize fell to Mr. W. Hill, and the second to Mr. J. A. Cooke, who owed their success in the main to the sprinting abilities of the young ladies who accompanied them. Lady Beatrice Pretymann, who was accompanied by Mr. E. G. Pretymann, distributed the prizes.

MOTOR-BUS MISHAPS.

MR. SCHRODER, the St. Pancras coroner, has held an inquest on James Tombs, who died on the 7th inst. at University College Hospital from internal injuries due to being run over by a motor-omnibus belonging to Mr. Turner, of the Atlas and Waterloo Association. The evidence was highly contradictory, four to fourteen miles an hour being variously given as the speed of the omnibus. The jury returned a verdict of "Accidental death," and added that, owing to the conflicting

evidence, the cause of the accident was not clear. They recommended that the speed of motor-omnibuses at the spot where the accident took place should not exceed five to six miles an hour.

### ROAD REPORTS.

**DERBYSHIRE.**—The Derbyshire Association of Urban District Councils' Surveyors has sent to the urban councils of the county a series of resolutions urging the improvement of the roads. Mr. W. H. Grieves (surveyor to the Buxton Council) and Mr. W. Jaffray (surveyor to the Matlock Bath Council), as chairman and secretary respectively of the Association, point out that the main roads throughout Derbyshire do not compare favourably with those of other counties in England. Among other things the authorities are asked to seek from the County Council a larger allowance than £20 per mile for scavenging main roads and an allowance (not at present made) for watering main roads, the latter in view of the motor dust nuisance and the fact that the County Council receives a large sum in motor licence fees.

**LONDON.**—A short length of road is about to be made in Islington with Crempoid, and a dust laying experiment with the same material will shortly be carried out in Kensington.

**NOTTINGHAM.**—For three months past the Corporation of Nottingham have been experimenting with calcium chloride as a road dressing. The total cost of keeping a forty foot road free from dust by this means—if the dressings be given monthly—would be about £60 per mile per annum, inclusive of labour, cartage, chemicals, and water; but as there are several months when no sprinkling is required, it is estimated that the expense will not be more than that of the old method.

**HOUNSLOW.**—The local authority has taken a further step towards relieving the dust nuisance in the Bath road, on which motor traffic is extremely heavy. Last year about a hundred yards of the road were made up with a tarred preparation, but as this proved rather expensive a further section of the road has now been treated with a patent composition.

**FIFE.**—Mr. Thomas Aitken, the county surveyor, has introduced a tar-spraying apparatus for macadam roads fixed to ordinary watering vans. Its adaptation to motor watering vans should enable local authorities to tar long stretches of country roads expeditiously and with economy.

**SURREY.**—The Egham surveyor has reported to his council that the tar surface on the main road, which had been placed for a certain distance, was breaking up. The chairman of the council pointed out that several members of the Highway Committee were anxious to see experiments made of rolling in the material dry. There was a long and animated discussion on the subject, and in the end a motion was carried by a majority of one that on a portion of the main road which it was proposed to repair granite only should be used and properly rolled and watered, but that the mud scraped off should be carted away.

**WARWICKSHIRE.**—At the last meeting of the Warwickshire County Council petitions from the parish authorities of seventy-six villages were presented, entreating the superior body to compel motorists to reduce their speed when passing through villages. The Council decided that they could do nothing.

**FINCHLEY.**—Mr. Wakeham, the surveyor to the Middlesex County Council, has just presented plans of a bridge to be erected at the Dollis Ford, Finchley. This water splash, as it is called, in storm flood runs with six feet of water. Now that motor-car traffic is increasing the work has been taken in hand. Finchley, Hendon, and the County Council will each contribute towards the cost of the bridge, which is to be of iron girders.

### PUBLIC MOTOR SERVICES.

*We shall be pleased to receive the published time tables, list of fares, etc., of Public Motor Services for notice in this column.*

**THE red flag is now carried on the automobile, and not before it as in the old day, before such vehicles became recognised as legal traffic. At least, such is the case in the south, where the carrying of a red flag by a motor-bus signifies the ownership of the Sussex Motor Road Car Company, which has services between Pulborough, Littlehampton, Arundel, Steyning, Brighton and Worthing. The manager is Mr. W. Flexman French, whose headquarters are at the Railway Hotel Garage, Worthing. A time-table, with its week-day and Sunday services, has been prepared, and we notice that dogs are charged for at passenger rates. Passengers' luggage up to 14 lbs. in weight is carried free, and parcels weighing over 1 cwt. are refused. Mr. Arthur Stubbs, 26 Grafton Road, Worthing, is the secretary, and the company is to be congratulated on the conduct of its services during the season now waning.**

**AN hourly motor-car service is being run between Southport and Ormskirk.**

**THE motor rail service which it was proposed to run between Peterborough and Sleaford has been indefinitely postponed.**

**THE managing director of the Indian Cycle and General Engineering Company is organising a motor service from Mysore to Mercara. This is to meet the requirements of planters and to replace the tonga service now existing. It should form a satisfactory means of coping with the Coorgorango transport question.**

**SPEAKING at the meeting of the Cambrian Railway Company recently, Mr. Bailey said the company had two motor-cars running in**

**the neighbourhood of Pwllheli which were answering admirably. They had the accident at Handcross Hill before their eyes, and that was what they feared in Wales, where the roads were terrible, some of the gradients being as much as 1 in 6. To insure greater safety they had carried out a new idea, namely, to have a brake independent of the driver, and worked by the guard.**

**THE Southwick Urban District Council have favourably entertained an application from the Brighton, Hove, and Preston United Omnibus Company, Ltd., for licences to two motor-omnibuses for use in emergency on their Kemp Town to Worthing route and for additional Bank Holiday traffic. They have also granted licences for two further motor-omnibuses to be run by an hourly service between Holland Road, Hove, and Worthing.**

**A LOCAL company is about to be formed to run a service of motor vehicles from Hendon Station to the tube railway at Golder's Green, which is shortly to be opened.**

**THE London County Council has served notices on the London motor-omnibus companies prohibiting the discharge of petrol or any product liable to give off inflammable vapour into the sewers.**

**OWING to the electrification of the North London lines of the London County Council the tram service is curtailed to a minimum, with the result that there is quite an invasion of motor-omnibuses. Following close on the new service between Kingsland Gate and Hammersmith there has been inaugurated a series of motor-omnibuses between Camberwell Green and Dalston Junction, via the Elephant and Castle, the Borough, London Bridge, and Cornhill, Liverpool Street, Shoreditch, and Kingsland Road.**

**THE Great Western Railway Company are prepared to run motor-omnibuses from Lampeter to Aberayron and from Llandysul to Newquay, the county council making the necessary improvements on the roads.**

**PRESIDING over the half-yearly meeting of the Isle of Wight Railway Company, the Chairman (Mr. Horace F. Tabourdin) referred to the question of motor-omnibuses in the Isle of Wight. He said that their own company had not suffered very much from this class of competition, although it had to some extent affected adversely the Isle of Wight Central Company. These motor-omnibuses had been running about the island, but they were now gradually disappearing from its roads and were going over to Portsmouth, and he did not suppose that it was likely that they would see much more of them in the future, because the hills and roads in the Isle of Wight possessed such gradients that it was not possible to work the motor-omnibuses at a profit.**

**THE London and South-Western Railway have decided to take over the motor-bus service established by Messrs. Thornycroft and Co., between Farnham and Haslemere, via Hindhead.**

**OWING to the society which a large number of motor-busmen had joined having recently fallen through, a number of the men approached the Amalgamated Association of Tramway and Vehicle Workers with the idea of joining that body, and a meeting was arranged at Whitfield's Tabernacle, Tottenham Court Road, on the 17th inst., for the purpose of having the association's objects explained. Only about twenty men, however, attended.**

### NEW COMPANIES REGISTERED.

**H. FLEMING AND Co.**—£10,000. To acquire the business carried on in the United Kingdom and British dominions as Fleming and Co., of 361-3, City Road, London; to adopt agreements (1) with the said company and (2) with A. O. McKee, and to carry on the business of manufacturers of and dealers in motor and cycle specialities and accessories, &c., 361-3, City Road, London.

**THE Automobile Agency and Auctions, Ltd.**, has issued a prospectus. The share capital is £5,000, and the solicitors are Messrs. Weldon and Edwards, 3 and 4, Great Winchester Street, E.C.

**M. DE BROU AND COMPANY.**—£5,000. To acquire the agency for the United Kingdom and colonies for the sale of Florentia chassis and touring cars, and to adopt an agreement with Maurice de Brou. First directors, M. de Brou and C. B. White, 76, Beaufort Mansions, Beaufort Street, Chelsea, S.W.

**FLEXIBLE CLUTCH AND GEAR SYNDICATE.**—£3,000. Manufacturers of motor clutches and gearings, &c.; to acquire a patent (provisionally applied for) on the terms of an agreement with Mr. R. H. N. Mintorn.

**LAW, CAR AND GENERAL INSURANCE CORPORATION.**—£100,000. To carry on all kinds of insurance (except life insurance). 24, St. Martin's Lane, Cannon Street, E.C.

**BALA MOTOR COMPANY.** £1,000 (£1). Astitle. Registered without articles.

**BRIGHTON AND SOUTH COAST MOTOR-BOAT COMPANY.**—£1,000. To take over the business of a motor-boat proprietor carried on by Mr. G. Hill at Brighton. No initial public issue. First directors: Messrs. A. Gorham, W. Hodgkinson, G. Hill, J. H. Thompson, W. P. Dare, and E. Webb. 2, Chanctonbury Road, Hove.

**ADRIA MOTOR COMPANY.**—£5,000. No initial public issue.

**THE BRITISH MOTOR-BOAT CLUB PROPRIETARY (GLASGOW BRANCH).**—Registered without capital, being limited by guarantee of its twenty members, to conduct a club for the encouragement and development, in and around the British Isles, of motor boating and of industries affecting the same.

**MALCOLM FRASER WHEEL SYNDICATE.**—Capital, £10,000. To

acquire and work Mr. A. R. Hubbard's inventions for improvements in tyres. Broad Street House, E.C.

**MIDDLETON PNEUMATIC HUB COMPANY.**—Capital, £80,000. To adopt an agreement with the Middleton Pneumatic Hub Syndicate, Ltd., and to carry on the business of pneumatic hub manufacturers, &c. First directors: Messrs. A. N. Argenti, J. Davis, and H. Fladyer. 21 to 23, Cale Street, Chelsea, S.W.

**REO MOTORS.**—Capital, £10,000. To acquire all or part of the business, assets, and liabilities of the Anglo-American Distributing Syndicate, of London and New York, and of Mr. J. E. Lambie, of 31-33, High Holborn, W.C., and to carry on the business of manufacturers of motors, cycles, boats, launches, &c. No initial public issue. First directors: Mr. J. E. Lambie (managing director) and others to be appointed by the signatories. Little George Street, Broad Sanctuary, Westminster.

### INGENIOUS FRAUDS BY A MOTOR-CAR DRIVER.

A MOTOR-CAR driver named Josiah Daggett Hibbert, alias Charles Lilburn, at the Surrey Quarter Sessions at Kingston, was indicted for stealing a motor-car accumulator. Mr. W. B. Campbell, who prosecuted, said that Hibbert presented himself in motoring attire to Mr. Turner, of Chertsey, and, representing that he had had an accident with his motor-car, asked for an accumulator, which was given to him, and which he subsequently sold for 14s. An officer said that Hibbert had been going about the country obtaining goods and money by falsely representing that he was a motor-car driver. The chairman described it as a very ingenious piece of trickery, and sentenced the prisoner to three months' hard labour.

### SEQUEL TO AN UNAUTHORISED TRIP.

ALBERT ROCKELL, an eighteen-year-old chauffeur, was charged at Marylebone on the 14th with stealing a motor tyre, valued at £6, the property of Mr. Isaac Zalic Davis. It was stated that Rockell was formerly in the prosecutor's service. Recently Mr. Davis took his car to a garage to be sold. It was alleged that Rockell went there under the pretence of speaking to Mr. Davis on the telephone, and obtained possession of the car and took it out. With three other youths, he went on a motor tour through the Thames Valley, sleeping at night in the car. After two days the vehicle broke down. The next two days were occupied in repairing it, and when at last they succeeded in getting it to go again Rockell brought it back to London and returned it. A motor-car dealer at Maidenhead said Rockell obtained from him a quantity of petrol and the loan of 10s., leaving the tyre in question behind as security. Mr. Paul Taylor sentenced Rockell to two months' hard labour.

### OBSTRUCTING THE HIGHWAY.

AT Nottingham, Thomas Hutchinson and Thomas Dobbs were charged with being drunk and disorderly on the highway at Gotham, Notts, on the 2nd inst. Mr. C. E. Wells Lucas prosecuted, instructed by the Notts Automobile Club. Superintendent Harrop, of the Notts Constabulary, was in Mr. Stafford's motor-car driven by the owner. When approaching Gotham Dobbs threw in front of the car a large bundle of herbs. Mr. Harrop got out to expostulate with him, and pointed out the danger of such an act. The other prisoner thereupon set upon him with a heavy stick, and Mr. Harrop promptly knocked him down. He took both the prisoners to the police station at East Leake, and handed them over to Sergeant Brown, who stated that they were both drunk. Mr. Lucas said that the practice of throwing missiles at passing motor-cars was on the increase. The Notts Automobile Club thought it a proper case for them to take up, and they asked the Bench to make an example of the two prisoners as a warning to others that this sort of thing could not be tolerated. The Chairman said this was a very serious matter, and might lead to an accident, and must be stopped. Taking into consideration that the prisoners had been in custody two days, and that the elder prisoner had been somewhat punished by Superintendent Harrop, they would fine them 15s. or seven days.

Two labourers were summoned before the magistrates at Blofield, Norfolk, last week, for assaulting Dr. Frank Ehrke, of The Firs, Kempsey, Worcester. While driving his motor-car Dr. Ehrke saw on the road a wagon loaded with hay, drawn by two horses. The driver of the team pulled properly to the side of the road, but the leading horse turned and tried to go back. The complainant got out of his car, and suggested that someone should go to the head of the leading horse. A torrent of abuse was the only reply. When he inquired the name of the owner of the wagon, the defendants, who were drunk, attacked him and knocked him down. Each of the defendants was sentenced to two months' hard labour for the assault on Dr. Ehrke, and another month for assaulting a man who came to his assistance.

### CASES AGAINST MOTORISTS.

AT the Kingston County Bench, Dr. Ross MacMahon, of 1, Upper Phillimore Place, Kensington, W., was summoned for assaulting William Herridge on August 3. The complainant said he was employed to keep the lodge gate leading on to Coombe Warren, Kingston Hill,

and on the date in question the defendant drove up in a motor-car, in which a lady and another gentleman were seated, about half-past ten o'clock at night, and asked him to open the gate and let him through, as he had taken the wrong turning, and could not get his motor-car back. The witness told him he could not come through the gate at that time of night, and refused to open it. The defendant thereupon knocked the staple out of the gate, and, when the witness interfered, struck him on the head. He drove the car through the gate. The defendant denied the assault. He tried to persuade the complainant to let him through, he said, telling him who he was and where he lived, but he would not consent, so he opened the gate himself. The chairman said he thought the complainant ought to have allowed the defendant to pass, as he gave him his name and address, and the summons would be dismissed.

A CONTEMPORARY regretfully announces that only six motorists appeared before the county justices at their last sitting at Guildford.

AT the Bray Petty Sessions, John Farrell, licensed motor-car driver, Dublin, was prosecuted for not having a proper rear light to his car. The magistrates decided to impose the reduced fine of one shilling. Subsequently, it having been mentioned to their worships that the imposition of a fine would necessitate an endorsement on the defendant's licence, the chairman said that he would be merely cautioned.

A BATCH of cases was recently heard at Bath, many fines being imposed. At Kingston one day eleven motorists appeared, leaving behind them more than £32 in aid of the county funds.

AT Malvern two motorists who were fined for leaving their cars unattended while they had refreshment made defence to the effect that they were permitted to do so in Birmingham.

FOUR motorists appeared at the Battle Petty Sessions on the 14th inst. Fines aggregating £25 and costs were imposed. In the case against Frederick Phillips, who was summoned for driving to the public danger, one of the witnesses, Arthur Goulder, Ewhurst, when pressed, said he could not say the car was being driven to the danger of the public. Witness said when he was served with his subpoena the constable read over the statement he had taken down, but witness replied: "I did not say all that." He had never said anything

Heath on the Panhard on which he finished sixth in the Grand Prix Race.

[From a Caricature in *Le Chauffeur*.]

about thirty miles an hour. On entering into conversation, the sergeant remarked, "Can we make a case of this?" and then asked for their names and addresses. Defendant said the car was descending the hill by its own weight. There were no side turnings, and witness could see over the hedges if anyone had been coming across the fields. The indicator showed the car proceeded at sixteen miles an hour down the hill, and it could have pulled up easily in five yards. The curves were very slight, and one could obtain a good view of the road. Witness's companion was smoking a cigarette, which would not have been possible had they been travelling at thirty miles an hour. The Bench fined defendant £10 and costs.

MR. WILLIAM JACKSON, J.P., was summoned, at Highgate, for driving a motor-car to the danger of the public in the Great North Road, Whetstone, on July 9. William Hills, a coal carman, said he saw Mr. Jackson's car going towards High Barnet. In order to pass another car the first car went on the wrong side of the roadway, and knocked a three-year-old child down, seriously injuring him. Sergeant Pargiter said that after the accident Mr. Jackson admitted that he was on the wrong side of the road, and that the child ran in front of the car. Mr. Jackson had just returned from India, and said the Great North Road was strange to him. He was not travelling at a greater speed than five miles an hour. Owing to a block in the traffic he went to the wrong side of a tramway centre pole at Whetstone. The child ran into the roadway, and was knocked down. The Bench, after a consultation in private, dismissed the summons.

A KENDAL motor-cyclist has had to appear before the Lancaster bench, to show cause, &c., for not having an identification plate fixed to the trailer attached to his motor-bicycle. The motor-cyclist admitted that there was no plate, but pointed out that the "trailer" consisted simply of a rider of a push bicycle, whom he had given a "friendly lead" up a hill, the means of attachment being just a little piece of string. The string was held in the hands of the two riders. The Inland Revenue claimed that this made the attached cycle a "trailer," under section 2, sub-section 2, of the Motor Car Act. The Bench rightly dismissed the charge; which, in our opinion, was too silly to have ever been brought.

### MAGNETO IGNITION.

UNDER the auspices of the Manchester and District Cycle Trades' Association an interesting lecture on the Simma-Bosch magneto ignition was recently given by Mr. R. Lascelles, who remarked that the use of magneto ignition for petrol motors had been greatly retarded by the fact that its principles were not understood, and that consequently many motorists and motor dealers fought shy of it. The magneto ignition system was no longer an experiment; it had proved satisfactory for nearly ten years, and had been greatly improved of late. Early magnetos in 1898 weighed as much as 4½ lbs., but they had been reduced to a few pounds. In reply to questions, the lecturer stated that the average life of the magnets is two years—some last even longer—and they can be magnetised by the makers at a very small cost. To find out if magnets require attention, all that is necessary is to turn the armature with the fingers; if a distinct pull is felt, the magnets are in good order. It is advisable to cover the instrument with a leather casing when fitted in an exposed position, as on a motor-cycle. If the magnets are removed, a keeper should always be placed on them until replaced in position. The carbon brushes which convey the current from the armature to the insulated terminal should be kept in perfect contact. When taken off the machine temporarily, the north and south poles of the magneto should be locked or keyed together until replaced.

### CASES DISMISSED.

CAPTAIN W. H. DARELL, of the Coldstream Guards, was summoned at Marlow recently for driving a motor-car at twenty-six miles an hour near Marlow on July 22nd. A police sergeant and a constable swore they "trapped" the defendant at 3.15 in the afternoon. Defendant swore the time was 4.15, and the police-books, produced by order of the Bench, showed the captain's statement to be correct. Under the circumstances the magistrates dismissed the case.

A BATCH of well-known motor-cyclists have appeared as defendants at Banbridge (co. Down) Petty Sessions to answer summonses for having, on 9th June, "driven motor-bicycles on the public highway recklessly or negligently, or at a speed or in a manner which was dangerous to the public, at Ballyvalley and Banbridge." The defendants were—Thomas Ireland, 53, Donegall Street, Belfast; Thomas Greer, Lissan, Cookstown; Lawrence Wickham, 51, 53, and 55, Mount Merrion Avenue, Blackrock, Dublin; Charles H. Lewis, 5, Windsor Road, Rathmines, Dublin; and Alexander Bullick, Erin Cottage, Andersonstown, Belfast; and the complainant in all the summonses was Sergeant Abraham Wishart, R.I.C. The prosecution arose out of the reliability run for the Triumph Cup between Belfast and Dublin. The Bench held that the cases had not been proved, and dismissed them.

### MOTOR-CAR ACCIDENTS.

AT Totnes, Mr. Hacker, coroner, has held an inquest on the body of Mrs. Boucher, of Bristol, who was killed in a motor accident at Hood Bridge on Thursday of last week, when she was thrown over the bridge and fell a distance of 30 ft. on the bank of the river Dart. Mr. William Lewis, the driver of the car and son-in-law of Mrs. Boucher, explained that they were returning from Paignton to Ashburton, and he failed to take a sharp turn at Hood Bridge. The road was strange, and he must either have underrated the turning or was going faster than he thought. He approached the bridge at about sixteen miles an hour, but slowed up considerably before he reached it. The car grazed the side of the bridge wall, and he was afraid to put on the brake full for fear they would be unseated. He did not feel any jerk, and all he saw was Mrs. Boucher's back and legs going over the wall. The coroner remarked that the lanes of Devonshire were very different from those "up country," and there were complicated turns and twists approaching the bridges. Sixteen miles an hour was a big speed. A verdict was returned of accidental death.

A TERRIBLE motor-car accident occurred at Leeds on Friday of last week, one person being killed and five others injured. The car was on a trial run and was being driven by Mr. Tom Herbert Atkinson, of the firm of Atkinson and Co., Kirkstall, towards the centre of the city, when, at the junction of Harehills Road and Roundhay Road, a collision took place with a horse and cart. The passengers on the car were employees at the Queen's Hotel, Leeds, and one of them, John T. Ring, was killed. Another passenger, Mr. W. Saxton, was seriously bruised and cut, while the driver of the cart received similar injuries and also had his leg broken. The horse of the cart was killed. The car, after coming into collision with the horse and cart, crashed into a governess car, the occupants of which, three ladies, were thrown out and considerably bruised. The first collision occurred at a junction of two roads running at right angles, so that the drivers were unable to see each other until it was too late to avert a disaster. Mr. Atkinson had a miraculous escape, being only slightly injured. The inquest has been adjourned.

WHILE riding a bicycle from Horsham to Goring on Saturday, a youth named George Smith, living at Park Terrace West, Horsham, was run down by a motor-car. He was found lying unconscious at the side of the road near Washington, in the vicinity of the Postal, with

his machine smashed beside him. A motorist who made the discovery conveyed Smith in his car to the surgery of Dr. W. Lockwood, at Worthing, where it was found that no bones were broken, but that the lad was very badly shaken. He was subsequently taken by P.C. Merritt in a cab to his friends at Goring, and is progressing favourably.

THE self-sacrifice of Baron Ad Kerdyn de Lettenhove averted a catastrophe in North Devon on Thursday of last week. While the baron and his chauffeur were motoring from Bournemouth to Ilfracombe, having recently crossed from France, they met a four-wheeled conveyance containing three ladies and a gentleman. The horse became frightened and swerved, and a disaster appeared inevitable, but without hesitation the baron ordered the chauffeur to steer into the hedge. He at once did so, and the car dashed into a piece of stone wall and completely pitched the occupants into the road. The motorists could speak but little English, which made it difficult for the ladies and gentleman in the other conveyance to render assistance. Fortunately, beyond receiving a severe shock, they were uninjured.

LIEUT. HARFORD, of the 1st Battalion Scots Guards, Aldershot, has been badly injured at Bagshot, Surrey, his motor-cycle colliding with a motor-car. He was pinned between a lamp-post and the car, and sustained a compound fracture of the leg, together with a serious scalp wound, in addition to minor injuries, and was removed to the Cricketers' Hotel in a somewhat critical condition.

MR. H. B. SEWELL, coroner for West Kent, held an inquest at Bromley on Monday concerning the death of Susanna Wallis, of Croydon, who was killed while on a visit to Bromley on Friday of last week through a horse bolting on being frightened by a motor-wagon. The jury found that it was a case of accidental death and that no one was to blame. They added a recommendation that, having regard to the large amount of motor traffic and the consequent danger of frightened horses bolting, the wheels of standing horse vehicles should be chained or that a van-boy or some one should be in charge when a driver had relinquished the reins.

### POLICE TRAPS.

IN a case heard at Wymondham, Norfolk, a police constable has described a trap. He and another constable were on duty in private clothes watching for motor-cars, as there had been complaints about the speed at which they travelled through the town. A quarter of a mile was measured, and witness took up position at one end and Locke at the other. Just before seven o'clock in the evening he saw a motor-car approaching, and as it entered upon the measured distance he signalled to Locke. The car covered the quarter of a mile in 35 sec., which was at the rate of twenty-five miles an hour. His colleague corroborated, but said he made the time 33 sec., which would give a speed, at the rate of twenty-seven miles an hour. Both he and the other constable used stop watches, and he attributed the difference of 2 sec. to the loss of time caused by the signalling.

OFFICIALS of the Automobile Association have discovered a cunningly-devised police trap on the Great North Road near Bawtry. The distances marked out were a quarter, half, and three-quarters of a mile. Some men who were apparently peaceful labourers working in a field proved to be in reality constables, who on a signal from a look-out man scrambled to positions behind a hedge to time the unwary motorist.

A THREE mile stretch on the Hoole road is being used by the Chester police for the trapping of motorists.

THE Lancaster police have revived the trap on the Burton road, Warton, with which they replenished the county funds some time ago.

### TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

Photographers, both professional and amateur, are invited to send photographs of current events or of motoring scenes and incidents. The fee, if any, required for reproduction should be stated in each case; other wise no liability will be accepted.

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

## M.C.J. PRIZE COMPETITIONS.

### FOR MOTORING EXPERIENCES.

THE proprietors of the *M.C.J.* offer three prizes—one of a guinea and two of half-a-guinea each—for the most humorous motoring experience, limited to 100 words, and to be written on a postcard. It must be concisely worded, and should be a record of something that has actually happened. The last day for receiving competitions will be Saturday, September 15th. All entries must be sent to the *M.C.J.* Office, 27-33, Charing Cross Road, W.C., and the Editor's decision will be final. A selection of the unsuccessful experiences will be given in the same issue as that in which the awards are announced.

### AUTOMOBILE PHOTOGRAPHS.

Three prizes are also offered—one of a guinea and two of half a guinea—for the best photograph in which a motor-car figures. In making the award regard will be paid to the public interest of the picture, as well as to its artistic merits; hence, photographs of cars outside historic buildings or monuments will be as welcome as those of vehicles in pleasant places.

Only original photographs may be submitted, the copyright of which belongs to the competitor. The winning photographs will be published in the *M.C.J.*, and the Editor reserves the right to reproduce, without special payment, a selection of those not successful in the competition. The dates for sending in photographs, and further particulars of this competition, will be announced in our issue of the 8th inst.

## COMMENTS.

### Brakes on 'Buses.

It will be reassuring to the public to learn that the police recognise the necessity of insisting that the bus companies now running motor vehicles in the Metropolis shall conform to the regulations with regard to brakes. We understand an officer has been specially deputed to watch this matter, and already action has been taken. Unfortunately the fines are visited on the driver; but the fact that the police are now watchful is of importance to the companies.

### The Motor Union at Scarborough.

YORKSHIRE motorists were interested in our announcement last week that the Motor Union proposes to hold its next provincial gathering at Scarborough on Saturday, the 22nd inst., when it is expected that automobilists from all parts of the country will congregate and carry out the interesting programme which is now being arranged. The Corporation of Scarborough have extended to the Union a hearty invitation to hold its meeting in that town, and have promised to do all in their power to make the gathering a success. Among other attractions, a garden party will be held in the afternoon. Some members will, no doubt, travel to Scarborough by train, and for their convenience arrangements are being made with the North-Eastern Railway Company for a special train to be run on the

Sunday afternoon from Scarborough to York, to connect with the north and south dining-car expresses, so as to enable members to get home to all parts of England on the Sunday if they so desire. One of the interesting functions at these gatherings is the dinner, which on this occasion will be held at the Grand Hotel, Scarborough, with Lord Wenlock (President of the North Yorkshire Automobile Club) in the chair. Motorists who desire to attend the gathering can obtain full information from the Secretary of the Motor Union, Mr. Rees Jeffreys, 1, Albemarle Street, Piccadilly, London, W.

### Proposed Race Meet at Blackpool.

THOUGH the luxury has hitherto proved a somewhat expensive one, there are some people at Blackpool who wish for another motor meet there. The local automobile club is moving in the matter, and, in conjunction with the mayor, have prepared a scheme for a race meeting in October. Mr. Huntley Walker, as president of the Blackpool and Fylde Club, is taking great interest in the matter, and Alderman Bickerstaffe is seeking to arouse local interest. He cannot yet hazard an opinion as to whether there will be another motor meet in Blackpool or not, but if there is, it will have to be considered simply as a motor meet, and this would involve the question as to whether or not it will be beneficial to the other interests of the town. We notice that Mr. J. C. Derham, the Chief Constable, was among those at the preliminary meeting, and trust that his presence there was evidence of his intention not to harass the local motor trade in future. That is even more important than being armed with "a little brief authority" at motor meets.

### International Trophy.

Now that the entries for the International Tourist Race in the Isle of Man have closed, we may inform our readers that forty-nine cars have been entered, the entrants since the publication of our last list being the Florentia, Vici, S.C.A.R., Academy, Rapid, and Armadale. In addition to these the participants in the event comprise cars of the following makes, viz., Metallurgique, Straker-Squire (2), Gladiator, Bianchi, Hardman, Swift, Climax, Speedwell, Star (2), Scout, Deasy (2), Thornycroft, Berliet (2), Siddeley (2), Peugeot, Rover (2), Arles (2), Humber (2), Pipe, Clement, Brown, Argyll (2), Arrol-Johnston (2), James and Browne, Minerva (2), Rolls-Royce (2), Darracq (2), and Vinot (2). It has been decided that the cars must be presented for weighing and examination on the 25th inst. at the Club Enclosure in Alexander Drive, Douglas.

### The Economy of Speedometers.

A NORTHERN J.P., whose driver has just appeared before the Lancaster magistrates for driving too rapidly over a distance marked by the police for trapping purposes, has been fined a reduced amount because he showed a desire to keep within the law. In giving evidence, Mr. Porritt, J.P., said he had the best and most reliable speedometer he could obtain

fixed on his car, because he did not want to break the law, and travelling over the road in question frequently he knew of the existence of traps between Preston and Milnthorpe. He kept his eye on the speedometer all the way on the journey in question, and at the time of the alleged offence it registered between 19 and 20 miles an hour. He was quite certain they were not exceeding the speed limit. The Bench imposed a fine of £2 10s. and costs, the Chairman stating that they had not imposed the usual fine of £5 and costs because Mr. Porritt had obtained the speedometer with the object of keeping within the law. The magistrates, however, took the police watches to be more correct than a speedometer. Upon this latter point two opinions may be allowed.

◆ ◆ ◆  
**Mr. Edison  
and his  
Steam Car.**

WHILE his fame rests almost entirely upon his work in the electrical field, Mr. Thomas A. Edison has long been a consistent user of White steam cars. His recent journey through the South in search of cobalt was made with two of these cars. He occupied one with his son, and in the other rode two of his laboratory assistants. The tonneau was removed from this second car and a platform was built in place

thereof. On this was carried a complete camping outfit, so that the party were enabled to put up for the night at any point desired. There was also a complete laboratory equipment, so that analysis of mineral deposit could be carried out on the spot. Mr. Edison, although interested commercially in the development of the electric vehicle, has used White cars exclusively for some few years on all of his tours. While he never takes a vacation in the true sense of the word, several times a year, when his business takes him to various parts of the country, he travels in his automobile.

◆ ◆ ◆  
**Above the heads  
of the People.**

GENERAL BOOTH'S motor-car tour has been favoured by fine weather and good vehicles, with the result that it has proved the most enjoyable trip he has yet undertaken. But he must not be too venturesome. At Chard, the other day, he told the Mayor and Town Council that other religious organisations were copying the methods of the Salvation Army. He should, however, still keep in advance, for, if they went motoring, he should take to ballooning. Therein, however, lies the danger; for the world might then regard it as soaring beyond "the heads of the people," which it has refrained from doing up to the present. No, General, you had better keep to the motor-car.

◆ ◆ ◆  
**The Scottish  
Club.**

It was a very satisfactory report that was presented to the members of the Scottish Automobile Club at their meeting in Glasgow on Thursday, the 30th ult. The active membership on the 16th ult. was 620, to which the Eastern Section contributed 179 and the Western 441, the cash balances of each being on January 31st £253 and £377 respectively. Substantial augmentations have since been made in each division. Reference was made to several applications for restriction of speed and to others that are pending at Kinross, Renfrew, Stirling, Wigtown, Ayr, Dollar, and Paisley. With regard to the development of the commercial vehicle north of the Tweed it was mentioned that a series of such trials will shortly be organised in Scotland. Naturally satisfaction was expressed with regard to the recognised position of the Club as a governing body for automobilism in Scotland. Another question of policy has lately occasioned much thoughtful consideration, viz., the unification of the two sections into which the Club has hitherto been divided. The General Council has come to the conclusion, and, we believe, wisely so, that the work of the organisation might be usefully extended by the abolition of the sectional idea and welding all in one association. There is no doubt the united strength would contribute to the general power of the Club and help the further development of the movement in North Britain.

◆ ◆ ◆  
**An  
Impasse.**

THE desire of the Scottish Club authorities to organise a trial of commercial vehicles will be regarded with some amount of uneasiness in Piccadilly, where matters are not running smoothly concerning the similar contest which the A.C.G.B.I. has been seeking to hold for some months, we had nearly written years, past. There seems a curious habit of postponement about the English Club's trial of commercial vehicles, and unless something definite is settled ere long makers of delivery vans will be sending their entries northward, to the isolation of the Piccadilly Club, which seems to have come to an impasse in the matter. The story of the difficulty is set forth in the letter of Col. Crompton on another page, and there will be a considerable feeling of sympathy with the Motor Van, Wagon and Omnibus Users' Association. After all is said on behalf of the attitude of the Automobile Club the public will continue to recognise that the Association is the body most likely to understand the working conditions of motor vehicles; and, unless some sort of representation is accorded to it on the committee responsible for the trials, it would appear that the long-expressed resolution of the A.C.G.B.I. to organise such trials may be again deferred. The decision of the Scottish Club at such a juncture to hold a trial of commercial vehicles is interesting, and may provoke a suggestion of joint action with the London Association of Motor Vehicle Users in regard to the same. Such can, however, be averted by the A.C.G.B.I. descending from its pedestal.

◆ ◆ ◆  
**A Society of  
Alcohol Research.**

FEARS of a steady rise in the price of petrol seem to have laid hold of the motoring public, and it is well that recent advances took place at the end of the season rather than at the beginning. But what of the future? That will doubtless provide topics for discussion at various gatherings of automobile clubs, and as alcohol is certain to be proposed as an alternative, the necessity of obtaining more expert knowledge on the subject than is now available is urgent. Hence the opportune moment seems to have arisen for the ventilation of the idea of a separate Society to seriously investigate the possibilities of alcohol in connection with Motorism. On this subject Mr. Radford Cooke contributes an interesting article to our present issue, which should prove the initiation of a profitable discussion to the automobile industry.

**Alcohol—its  
Practicability and  
Price.**

DEALING with the point which is often raised as to the comparative prices of alcohol and petrol, it seems to us that a great mistake is being made in attempting to compare the prices of these fuels, more especially at the present time. What we are, or should be, most concerned about for the moment is the practicability of alcohol as a motive power for high-speed engines. If that vital point is first settled, the time may then be ripe for the question of the comparative prices to be considered. Making these comparisons now appears to be putting the tonneau in front of the bonnet, for until the actual permanent practicability of alcohol is conclusively demonstrated the price consideration cannot apply. When once its practicability is proved here the question of cost can be dealt with. Probably it will be found, when the demand, production, and distribution have been established, that the price will compare very favourably; but, even taking the other view, that it may be the same or a little more, should not the patriotic and economic considerations that the millions going

unfortunate humanity. He, too, might claim exemption from taxation on a similar plea. Unfortunately, the Episcopal Bench is not sufficiently devoted to motoring to institute its own committee of defence on this subject; but the claim may well be made on its behalf. This and similar instances which might be adduced suggest that the Doctors are wise in bringing the matter forward; they will add to their reputation for sagacity by impressing upon the A.C.G.B.I., the Motor Union, and the Automobile Association, the necessity for an early conference on the whole subject of the taxation of cars.

**A Conference  
Needed.**

MEDICAL men have been the first to indicate their dissatisfaction with the proposed taxation scheme of the Royal Commission on Motor Cars, and on their behalf it has been suggested that the vehicles used by them for professional purposes should be classed as trade cars at half rates. Doubtless commercial travellers, and those who employ motor vehicles for the ordinary purposes of their work, will be equally sugges-

The Adler Fahrradwerke Gesellschaft, the makers of the Adler Cars, have recently established a large open-air motor-driving track in Frankfurt-am-Main. One of its features is a series of panoramic pictures representing the humorous side of motoring and cycling, by Herr Emil Kneiss, a well-known artist of Munich. The picture reproduced above is that which has for its subject the Herkomer Trophy Contest.

out of the country, into foreign hands for fuel will be spent in the country, to the advancement of home industries and to the solving of the increasing unemployed menace, be decisively weighty in its favour?

**Taxes on  
Doctors' Cars.**

RECENTLY a Committee of Medical Men using Motor Cars was formed, with Dr. Bruce Porter as hon. secretary, and some important information was placed before the Commission. The Doctor has such a busy life and so few opportunities of seeing his family that he very often takes one of them out with him on his rounds, and this would prevent his machine being called a "trade one." Considering the amount of service rendered to the State by the doctors who give their services free to hospitals and to the poor outside hospitals, some professional men reasonably think they might be treated under a special clause, and can doubtless make out a strong case. But what of the Bishop who uses a motor-car in his diocesan visitations, and who is equally charitably disposed as the doctor towards

tive with regard to improvements in the equity of the proposed Act. We agree that there is much to be said in favour of the exceptional treatment of cars for medical men, and if ministers are to claim a rebate from income tax assessment on rooms used as studies, doctors may well claim preferential rates for cars engaged in their rounds. But, before any definite plan of campaign is evolved in this direction by the medical profession, it may be well to await the full consideration of the whole subject by the authorities of the automobile movement.

**English and  
American Roads.**

"Two Americans in a Motor-Car" is the title of a brochure published in Brooklyn descriptive of a rambling journey in Wales, England, France, Belgium, Holland, and elsewhere by Mr. H. F. Gunnison. To this is added some suggested tours in Great Britain, by Mr. E. A. Rosenheim, whose name is well known among motoring circles in the north. One of the most characteristic notes of the work is the tribute paid to our roads as compared with those tracks that are called

by a similar name in the States. "Right here," says Mr. Gunnison at the beginning of his work, "I should say a word about the roads of England. In our entire trip we did not find a bit of road that was not far better than any portion of the Merrick road, on Long Island. Our patriotic Americans like to criticise European ways, but they are compelled to hang their heads in shame when they compare American roads with those in the old country. It is true we haven't been in the business so long, but it is also true that the inhabitants of the United States do not appreciate the necessity for smooth roads and attractive highways." Even England, however, is not yet perfect in this respect. Some day the wisdom of rounding corners and straightening the crooked ways will be apparent to those responsible for the conduct of national and county affairs.

#### Crying in the Wilderness.

THERE is a member of the Cheshire County Council plaintively bewailing the fact that the Report of the Royal Commission on Motor Cars is not altogether to his liking. Amid the chorus of approval with which the judicial pronouncement has been received Dr. Hodgson appears like one crying in the wilderness. According to him, the report is "a disgraceful failure to grasp the situation." The poor man was unable—according to his own confession at the last meeting of the Council—to find words strong enough to use about the matter. He appealed to the Main Roads Committee of the Council to do something practical to deal with the dust raised by the "blessed bounders" who motored. "If they will only do something I will forgive them," he sweetly pleaded, "but"—and we can imagine the doctor drawing himself to his full height and intoning with a splendid passion—"if they do nothing I will never forgive them." We trust something will be done, although we are somewhat indifferent as to the form it will take.

#### Stone Throwing.

It is gratifying to find educational authorities throughout the country are impressing upon the teachers the advisability of drawing the attention of their pupils to the folly and danger that lurks in the practice of stone throwing at automobiles. Lancashire, Lincolnshire, Herefordshire, Oxfordshire, and Nottinghamshire authorities have been most friendly disposed towards the suggestion of the Motor Union that the head teachers should have instructions on the matter, and in all those counties satisfactory warnings are being given. Although the Surrey Education Committee is cognisant of the evils of the habit they will take no direct steps; still they have no objection to the head teachers being circularised on the matter. Other authorities, like the education committees of Essex and Buckinghamshire, have decided to take no action, and motorists in these areas who can give the Union information of any cases of stone throwing should forward such without delay. A few examples brought to the notice of the County Councils would provide the Motor Union with a strong plea for a reversal of the policy of inactivity.

#### The Expedition of Theft.

A NOVELIST some time ago pictured the advantage of the motor-car as an adjunct to the plant of a high-class burglar, and now some motoring thieves have taken to scaring the good people of the villages between Chelmsford and Braintree out of their beds. In fact, so great is the alarm created by the nocturnal visitants that many peace-abiding citizens have not sought their beds at all, but have lain in wait armed with heavy bludgeons of dubious invitation for burglars who motor by night. It appears that one night last week a couple of thieves managed to steal in half a dozen villages, covering a distance of a score miles or more. This opens up a new terror for the lonely residents in the country. How to deal with it is a problem beyond ordinary ken.

#### Motorists' Clothing.

At length one of the organs devoted to the clothing industry is calling on its readers, in the words of the Prince of Wales, to "wake up," and realise the profit that might be made by selling clothes to motorists. A few firms in some of the large towns have been able to obtain quite a monopoly of this business, whereas there is room in every small town and large village for an enterprising clothier to cater for the needs of the wealthier class of residents. We notice that most of the leading clothing firms are appointing agents for special designs in motor clothes, liveries, &c., in much the same way as makers of accessories have agents for their productions in every place of importance. Only one or two have appointed direct agencies. This question of agency for motor-clothing may become a matter of burning politics in the motor world—occasional rumblings already foretelling a storm.

#### A Rustic's Suggestion.

THE letter signed "Rustic," which some good people have taken seriously, mainly because it appeared in the columns of the usually sedate "Morning Post," may be regarded as the *reductio ad absurdum* of rural prejudices. This sapient person advocates the erection of gates in narrow places and at dangerous corners, so that the speed of motor-cars could be checked. The expenses of maintenance might, he opines, be met by a small toll levied upon the motorist—just as if that personage was not already taxed and rated enough. Any margin of profit after the expenses of the tolls had been met should be devoted to the improvement of the road. By this plan it would be possible to secure a return of all cars passing through any particular district, and work could be found for discharged soldiers and sailors as gatekeepers. "Rustic" must be a really delightful person, and, if he has a voice, might prove an amusing addition to the programme of a Surrey J.P.'s garden party.

A COMPREHENSIVE list of marine motor victories won on "Shell" spirit has been issued by the General Petroleum Company, who inform us that the Wasp, which gained the gold medal for seagoing results in the Motor Yacht Club's Reliability Trials, this year was run on their "Silver Spray."

MESSRS. W. LECOQ, MCBRIDE AND CO., of 67A, Shaftesbury Avenue, London, W.C., have taken up the British agency for the Cinogene automatic starting apparatus for petrol motors. Some particulars of the device, which, jointly with the Mors Co.'s apparatus, secured the first prize in the competition held by the French Automobile Club last year, were given in the *M.C.J.* of December 30th last.

WE learn from Mr. A. R. Garnett, of Shaftesbury Avenue, London, W.C., the sole concessionaire for National cars, that for the 1906-07 season Messrs. Rose Brothers, of Gainsboro', the makers, are bringing out two new models of four-cylinder cars which will closely follow the Mercedes design. They will be of respectively 24-h.p. and 40-h.p., the engine of the former having cylinders 4½ in. bore by 5½ in. stroke, and the latter 5½ in. by 6 in. Hoffmann ball bearings will be fitted throughout, including the crankshaft of the motors.

MOTORISTS who tour will find the new pamphlet, "Sunshine and Storm," a useful work of reference. It is published by the Lacre Motor Car Co., Ltd., whose business comprises everything ranging from an overcoat to high-powered cars. Among the touring necessities illustrated in these well-arranged pages are some good types of hoods designed for the convenience of passengers mounting and dismounting, as well as for protection from dust and storm. A telescopic luggage guard is one of the novelties described, this consisting of a strong, yet light, tray held by straps for supporting the weight at the further end. It can be slid under the floor board of the tonneau out of sight, and is easily brought into use when travelling. A new claw tyre bracket is also illustrated, and the pamphlet reveals a variety of really high-class designs.

## ON THE EAST COAST.

THE Essex County Automobile Club is having a meet to-day (Saturday) at Frinton, a delightful and modest resort on the east coast, lying between Clacton and Walton-on-Sea. They will be entertained to luncheon at the Grand Hotel by Mr. E. A. Serre, and doubtless those who can find the time will have some good spins on the stretches of level road round about. Frinton has no great reputation, is not even mentioned in some automobile handbooks, and yet deserves recognition as a place of recuperative merit, with accommodation for cars. In fact, Messrs. Ratcliffe Bros., who are the motor people of Frinton and Great Holland, a neighbouring hamlet growing into big type, have known of motorists avoiding their little resort simply because rumour, often a discreditable piece of anonymity, said there was not accommodation for cars. And yet Messrs. Ratcliffe Brothers have a motor-car garage there 100 ft. by 40 ft., with repair works of good size and modern equipment, including an inspection pit 48 ft. long, and extending 10 ft. into the garage, for the use of chauffeurs.

Frinton was mentioned in Domesday Book under the name of Frietuna, but of history it has none of considerable interest. One point of interest is that a few years ago all the hedges between the town and its mile-away neighbour of Walton were done away, leaving a clear view of the sea—and of the road ahead. There have been more motor-cars in and about Walton this season than ever before. Mr. J. C. Moreland has good accommodation for storing and washing down cars in the High Street, and the hotels have also garage accommodation at standard rates. The climate is singularly dry and sunny, with a minimum rainfall. The country in the neighbourhood is level, and the roads, though at present rather loose owing to dry weather, are generally good. Still, despite its popular attractions, Walton with its evidences of sea encroachments is a drab sort of place, with nothing of especial interest to cause motorists to rest there, while a half-hour's run will take them to Harwich, and ferrying across the Orwell will land them at Felixstowe, a sunny little spot with a new pier, new hotel, and generally modern idea of itself—a charming centre for trips by road. Being but eighty miles from London, it is just a nice run from town, and motorists will have a good reception at the Felix Hotel, which has a garage capable of accommodating between thirty and forty cars. Felixstowe is trying to establish a winter season, and here its sunshine record should prove of value, for last year 1,802.1 hours of bright sunshine were recorded, as compared with 1,680.5 at Eastbourne, and 1,776.5 at Torquay.

Clacton-on-Sea, which was visited on Sunday last by the Essex Motor Club, some of the members of which stayed over till the following day to participate in the carnival connected with the regatta, is another popular east coast resort. There cannot be any doubt but that a very much larger number of motorists have visited the town during this season than at any time past (excepting perhaps the days in September, 1904, when Clacton was invaded from the sea during autumn manoeuvres, and there were 500 cars in the town on one day). There are excellent roads in the town; the County Council have recently laid a stretch of "tarmac" as an experiment for a short stretch in Pier Avenue, and experience has quite justified the venture. The main road from Colchester is also an excellent one, and the alternative route *via* St. Osyth, and direct roads to Walton, Frinton, Harwich, Manningtree and Ipswich are also features to attract motorists. Messrs. F. W. Lewellen and Co., whose place is in the Public Hall Buildings, are in a position to do any description of repair and provide all accessories as well as four different brands of motor spirit. There is also ample accommodation for cars at the various hotels in the town.

Quite three times the number of motor-cars have visited Lowestoft than was the case last year—and the number is always very great. The district is full of special features to attract the motorist. Lowestoft is a most interesting place and makes a remarkably fine centre. It is the headquarters for yachting and for the Broads; the roads are all remarkably good and there

are no hills of any moment. The hotels in the town are good and the local entertainments are all run on the best lines. Facilities are provided for sea-trips up and down the coast, the shipping is always interesting and the enormous fishing fleet of over 100 boats during October and November, when the town gets some of the best weather, is almost unique. During these months, too—in fact, after the end of August—the sea fishing starts from the beach, boats and piers, and this has created quite a second season in the town, a large number of the best-class people motoring down for the purpose of this sea fishing.

With regard to accommodation for cars, at the south end of the town there is a garage and repair shop run by Messrs. Smith, Savory and Co., who are able to charge accumulators and do all kinds of repair work in a well-equipped workshop. They have also accommodation for fifty motor-cars. The Empire Hotel has its own garage, as also the Royal Hotel, and lock-up accommodation is always in the Royal stables right opposite the pier. At the north end of the town there is the garage of Messrs. J. W. Brooke & Co., Ltd., which is of the very best type with a large accommodation, and where, of course, every type of repair can be undertaken.

It is a merry run from Lowestoft to Yarmouth. We remember the first time we did the journey on one of the early Brooke cars, accompanied by Mr. E. Estcourt, who has a delightful place near by, on his trusty Daimler. The breezes blow strongly at times—but of that the motorist takes no heed.

Inspecting the Automobile Association's Scouts on the Great North Road. Col. W. J. Bosworth (Chairman), and Mr. L. Schlenheim (Treasurer), call a halt at Dunbar.

Unfortunately there are police traps about, and last week some Lowestoft owners fell into one between the seventh and eighth milestone from Yarmouth on the Potter Heigham-Cromer road. There is, however, a motor freemasonry in East Anglia, and news of the police device was freely circulated among the hotels and garages where motorists congregate. At Yarmouth Major E. Durian has cars on hire for visitors, and often assists motorists calling at his place in St. Peter's Road, but what is wanted there is a large and well-arranged garage.

Though the places we have named have each their joys and pleasures, the town of Cromer claims to have merits above them all, one of which is that it affords a pleasant centre from which the motorist can visit the Norfolk Broads, Sandringham, Norwich, Lowestoft, Yarmouth, &c. During the present season nearly twice as many motorists have visited Cromer as compared with last year, and there is plenty of accommodation for cars at local hotels and garages. The Hotel de Paris is the appointed headquarters of the A.C.G.B.I. in Cromer. All these resorts have recognised the value of the motorist as a visitor, and those who journey that way need have no fear as to the welcome they will meet in the way of accommodation for man and car. The police, too, are generally friendly disposed towards motorists.

## SOME CURRENT TOPICS.

### The B.A.C.S. Motor-'Bus.

Some few months ago we announced that the British Automobile Commercial Syndicate were bringing out a new design of motor-'bus chassis. The first of the new vehicles has now been completed, and on Tuesday, last week, was subjected to a severe test of its hill-climbing capabilities. The frame of the 'bus is of very strong construction, being built up of pressed steel, with a sub-frame of channel steel, on which the engine and gear-box are supported. The motive power is supplied by an Aster-30-h.p. four-cylinder engine, a feature being the arrangement of the pipes to ensure a good water circulation. Two forms of high-tension ignition, magneto and coil and accumulators, are provided, these being controlled by separate levers. The gear-box, which is adapted to give three speeds forward and a reverse, is located well forward and is connected with the differential shaft by a universally-jointed shaft, on both ends of which large contracting brakes operated by one pedal are mounted. The final drive is by side chains to the rear road wheels, the hubs of which are fitted with hand-controlled com-

pensated brakes. The latter are so arranged that the bands can be readily removed and renewed without disturbing any other part. The change-speed pinions are unusually wide, while the axles are also of liberal dimensions; in fact, the various parts have been made sufficiently strong to allow of an engine of from 40 to 50-h.p. being fitted, where the vehicles are intended for service in difficult districts. On the trial trip alluded to above the 'bus carried nearly a dozen passengers and about two tons of ballast, so as to bring up the weight to that of the full complement of thirty-four persons for which the double-deck body has accommodation. From Long Acre, W.C., the vehicle made its way steadily through the traffic to the foot of West Hill, Highgate, one of the stiffest rises in North London. The hill is about three-quarters of a mile long, and, beginning with a grade of 1 in 17, it gradually becomes steeper up to a bend in the road, two-thirds of the distance, where the gradient is stated to be 1 in 6 for a hundred yards or so to the finish. The accompanying illustration depicts the 'bus on the hill, the steepness of which will easily be noted. Slowly but surely the vehicle wended its

way to the top, where the appearance of a motor-'bus for the first time attracted considerable attention. On the return journey, with the view of testing the efficacy of the brakes, the vehicle was brought to a stop on the steepest part. Altogether the demonstration was most successful, and should go a long way in inspiring confidence in the new B.A.C.S. 'bus.

### The Popularity of Motor Touring.

One of the striking features of the present motoring season has been the great popularity of touring by automobile. Right through the summer there has been an outpouring of motorists all over the country, each intent upon driving his car to some favourite objective point—whether at the seashore or to inland waters, to the mountain resorts or to the seclusion of the woods; while not a few have taken their vehicles over to the Continent, with the object of visiting some of the old-world places there to be found, and also of indulging in a spin along roads where the freedom from police traps enables one to enjoy the pleasures of motoring to the full. In this connection we learn that the work in the touring department of the A.C.G.B.I. has recently been exceptionally heavy. Special attention is given to assisting members—not only of that body, but of the Motor Union and affiliated societies—with information and advice in mapping out tours; and, as showing the extent to which this department is taken advantage of, we may mention that during the course of the other week more than £1,840 was deposited with it in connection with the special Continental Customs facilities, and over £60 worth of maps sold.

### The Corrosion of Accumulator Terminals.

In our correspondence columns the question is raised as to preventing the terminals of ignition accumulators from corroding. The corrosion is caused either by acid acting on them and producing an action between the lead and the brass, or, if thick brown paste is formed, the cause is due to an electrolytic action taking place. When acid moisture is collected to any extent on the top of a sealed accumulator, it will allow the passage of a current across the top of the cells, from one terminal to the other, the effect of this current being to gradually dissolve the lead and convert it into peroxide of lead in a pasty form. To remove this, the terminals and lead connections should be cleaned with warm water, and then ammonia and water, until they are perfectly clean, and no trace of corrosion or acid remains. All the traces of ammonia should also be cleaned away, and the terminals then anointed with vaseline. To prevent a recurrence of this, the sealing compound all round the terminal lugs should be melted by a hot iron, and all moisture removed as far down as possible. Then clean and keep dry the top of the cells, always endeavouring to prevent anything in the nature of a circuit getting across through moisture, dirt, etc. Corrosion on terminals is not a sign of decay; it sometimes occurs with new cells, and is always a thing to be carefully guarded against and arrested as soon as it is noticed. It is not absolutely preventable, as it is due to natural causes, which only care can counteract.

A MOTOR-CAR testing plant has recently been installed at the Saxon Imperial Testing Establishment in connection with the Technische Hochschule et Dresden.

THE "Brown" motor-cycle, which has succeeded in winning so many important events this season, is the subject of a new catalogue by Messrs. Brown Bros., in which its many excellent features are illustrated and described with exceptional fulness. This list also has some hints on the management of motor-cycles, and will be of value to all motor-cyclists.

THE Bowden Patents Syndicate, Ltd., have been awarded a gold medal at the Milan Exhibition for an exhibit of the various applications of the Bowden mechanism to motor-cars, marine engines, &c. It is interesting to learn that the novelty which appeared to attract the greatest interest was an exhaust cut-out operated by the Bowden mechanism from the dashboard, a device which is meeting with some disfavour in this country.

## THE ACTION OF A PETROL MOTOR.

UNDER the title "A Busy Man's Text Book on Automobiles," the Olds Motor Works, the makers of the Oldsmobile vehicles, have lately issued an interesting pamphlet explaining the functions of the various parts of a motor-car. The action of the four-cycle petrol motor is now fairly well understood by motorists, and it may seem somewhat late in the day to refer to it now, but the ranks of automobilists are extending so rapidly that the following extract from the booklet referred to

Fig. 1.

above may not be without interest, especially as the subject is dealt with on somewhat novel lines. Nothing could be simpler in operation than a petrol engine; in fact, nearly everyone is familiar with its action, although probably it has never been fully realised. A gun, for instance, is nothing more or less than a four-stroke cycle motor. As is well known, it requires four operations to go through one set of changes or "cycle" as it is technically termed, viz.:-

Introduction of Charge.	Explosion of Charge.
Compression of Charge.	Cleansing of Barrel.

This same set of conditions is effected in a petrol motor by four strokes of the piston—two in each direction, up and down:

Suction stroke.	Introduction of Gas.
Compression stroke.	Compression of Gas.
Working stroke.	Explosion of Gas.
Exhaust stroke.	Removal of Burnt Gases.

Now, to carry the comparison further, let us assume that the bullet in the gun is connected with the ramrod, and that the other end of the ramrod is fastened to a crank connected to a wheel, and that the travel of the bullet is limited, so that the bullet does not leave the barrel. If, now, we assume that the gun is a repeater, and equipped with a device which will intro-

Fig. 2.

Fig. 3.

duce and fire charges at regular intervals, we will virtually have a typical four-stroke cycle motor. In order to fix the succession of changes in the mind more thoroughly, reference may be made to the diagram shown in Fig. 2, from which it will be seen that once around the circle—representing two revolutions of the crank shaft—brings one back to the starting-point; the first quarter representing the suction stroke; the second, the compression stroke; third, the working stroke (indicated in black); and fourth, the exhaust stroke. Keeping this in mind, it is an easy matter to make a diagram which will show exactly what is happening in each cylinder of a four-cylinder engine. Fig. 3 represents such a diagram, from which it can be readily seen when the working stroke occurs, and that in a four-cylinder motor two impulses are given to the crank shaft at each revolution of the same. Noting the cross sections which are used to represent the various strokes, it will be observed that when

the charge is being fired in cylinder No. 4 the exhaust gas is being expelled in No. 3, the new gas is being compressed in No. 2, while in No. 1 the fresh charge is just being drawn into the combustion chamber.

## THE SWIFT 9-10-H.P. MOTOR.

WE are able to illustrate herewith the double-cylinder motor which the Swift Motor Company, Ltd., are fitting into their 9-10-h.p. car—a model to which they intend to devote considerable attention during the 1907 season, as the result of its success in the recent Scottish Reliability Trials, when it will be remembered that the Swift Company secured the gold medal in Class 1 for cars the chassis of which did not exceed £200. As will be seen, the two cylinders, which are 90 mm. bore by 110 mm. stroke, are cast separately; the valves are all located on the left-hand side of the engine, and operated off a single cam shaft, the gear wheels driving which are entirely enclosed. The contact maker is conveniently located, it being mounted on the upper end of a vertical spindle driven by bevel gearing off the cam shaft. The base chamber is, as usual

of aluminium, a large inspection cover being provided on one side to enable the big ends of the connecting rods to be readily examined. The fan for inducing a current of air through the radiator is driven off the crank shaft by a belt; provision for keeping the latter taut is made by mounting the fan spindle eccentrically. The aim of the makers has been to produce an engine which shall combine simplicity with great strength in all the working parts, an object which, as the illustration shows, would appear to have been fully attained.

THE Earl of Derby's motor-car was being driven from the moors to Crag Hall, six miles from Buxton, when, in descending a steep hill, the chain broke, and the car ran into a wall and upset. Mr. Wyndham Hall, steward, and others escaped with a shaking. The Earl of Derby himself was not in the car at the time; he, fortunately, happened to be walking.

AT the Cokermouth Rural District Council a request was received from the Embleton Parish Council asking that the Council take steps to close the district roads in the parish to motor-cars, on the ground that there was a serious danger and inconvenience to farmers by motor-cars being allowed on these roads. Mr. Wallace moved that they adopt the proposal. The matter was referred back to the Works Committee.

## A NOVEL SPARKING PLUG TESTER.

**A**N exceedingly useful and ingenious spark and sparking plug tester, of which we give an illustration herewith, has lately been introduced by Mr. Bourne-Dale, of High Lane, Chorlton-cum-Hardy, Manchester. The fitting consists of a porcelain insulator P mounted upon a bracket adapted to be either fixed under the sparking plug or to be screwed to the dashboard of the car. Attached to the insulator are three contacts, R, E, and T, respectively. The middle contact is connected to the usual plug wire from the coil, the plug now being connected to the top contact T, instead. The bracket under the plug completes the "earth" connection to the contact E.

To locate a faulty cylinder in a multi-cylinder motor, each switch should be opened separately by the insulated handle H while the motor is running; the cylinder that makes no difference in the running when cut out is the faulty one.

To test whether current is passing through the plug, the switch K should be slightly opened, and the spark between it (K) and contact R noted.

To test whether the current passing through the plug is producing a spark at the points, and that they are not short circuited by soot, &c., the switch K is closed into the top contact R, and the finger S brought close to the earth contact E. If a

spark is produced at the latter point (the current also being free to pass through the plug by the switch K), it shows that a spark is being produced at the plug points; for if the points of the plug are touching or "sooted up," thus short circuiting the coil, no spark could be got to the earth contact E. The strength of the spark at the plug and the distance between the points is indicated by the strength and length of the spark between S and E. The two sparks will not occur together, but the current will jump the shortest gap; therefore, as the battery has not to supply two sparks at the same time, the value of the test is, the maker claims, in no way jeopardised.

To test whether the coil is producing a spark the switch K is pulled out of the top contact R, and either it, K, or the finger S is turned round within sparking distance of the earth contact E and the spark noted.

Briefly stated in electrical language, the tests which can be made by the device are (1) A spark in series with the plug shows that there is current passing through the latter; (2) A spark in parallel or in shunt with the plug shows that there must be sufficient resistance at the plug points to maintain the necessary pressure to create the shunt spark.

The attachment can be employed in connection with either battery or magneto ignition and single or multi-cylinder motors; it enables the plugs to be tested under working conditions without removing them from the cylinders, while it also enables the working of the coil to be verified.

## USEFUL NOTES.

WHERE rubber hose is used to make connections in the water circulation pipes of a petrol motor, and has bends in it, a good plan is to reinforce it by a brass coil spring which is a good fit inside. This prevents any flattening at the bend and cracking, resulting eventually in a leak.

ANY small leak which appears in connection with the water circulation should be repaired as promptly as possible, for it quickly grows to a large one, which is much harder to repair. Nothing looks worse, nor, unfortunately, is more common, than to see a pool of water under a car which has been standing for some time.

SOME carburettors have a fine gauze covering over the extra air inlet, and it will often be found that this device is apt to cause the engine to work indifferently, owing to the fact that the gauze sometimes becomes completely choked by dust and dirt. The best way to remedy this, if the trouble is encountered when on the road, is to pierce fair-sized holes in the gauze with some pointed instrument.

IF rubber hose connections are used anywhere in the water-circulating system they had best be renewed at the beginning of each season, as they deteriorate rapidly, and sometimes the inside layer of fabric separates from the rest and impedes the circulation, without the defect being apparent from the outside. No kinks should be allowed in such connections, and the clamp fasteners should be properly secured.

IT is a bad practice to "race" a petrol motor—in other words, to allow it to run at its maximum speed, especially when the car is not in motion, as it puts unusual strains on many parts of the engine, particularly the reciprocating portions, and tends to wear them out prematurely. The strain on the connecting rods and valve mechanism, for instance, increases very rapidly with the speed. The shocks or hammering borne by the parts is very much greater at high speed than at normal speed, and may result in the crystallization of the parts and their eventual breakage.

BOTH brakes and steering gears are now generally well and safely constructed, but they, like all other mechanisms, warrant the closest scrutiny. Every motorist should assure himself that each nut, bolt, pin, or other device upon which their integrity depends is properly in place, and that nothing is weak or loose. Each brake on the car should frequently be tested upon the steepest available incline to see that it is capable of promptly bringing the machine to rest and holding it from motion in either direction, and, merely because one of the two brakes is little used, it should not be neglected, but kept in perfect adjustment for use in the emergency which its name denotes that it is intended to meet. Attention to brakes and steering gear upon the part of motorists, and the acquirement of a readiness to use them, will prevent all accidents not obviously attributable to recklessness, and dispel the erroneous idea that motor-cars are dangerous.

WHEN flooding of the carburettor occurs in the course of continued regular use, it is most likely due to a defective float. The floats now largely used are made of very thin metal stampings, and as the petrol has some slight chemical action on copper and brass, pinholes will occasionally develop in the float and admit the spirit to the interior, thereby reducing its buoyancy and causing it to maintain a higher level in the float chamber. Petrol is an extremely light fluid, and will gradually ooze through an opening far too small to be detected by the naked eye. The best way to determine whether the float leaks, therefore, is to take it out and shake it, and observe whether there is any noise of splashing petrol produced. An even more common cause of leaks in floats than punctures of the metal wall is the opening up of the soldered joint between the two parts. A leaky float containing petrol is rather difficult to deal with, and the best thing to do is often, in such a case, to get a new one.

MR. H. O. D. WALTHALL is the proprietor of the Colwyn Bay Motor Garage, in Greenfield Road, in that popular resort.

HENLEY Bridge, which is the only means of crossing the Thames between Marlow and Sonning, is in danger owing to the flood waters beneath and the heavy traction engine traffic above.

THE Palmer Tyre, Ltd., have reduced their charges for retreading tyres, and the alteration will show a considerable saving to users of the Palmer cord tyres.

WE illustrate herewith the 20-32-h.p. Darracq belonging to Mr. Herbert Sullivan, nephew of the late Sir Arthur Sullivan. The car was supplied by the Waterloo Motor Works, Chicheley Street, London, S.E., and the photograph shows it fitted with

Cape hood and wind screen, built entirely at the firm's premises in just a week from the receipt of the order. We may add that Mr. Sullivan, who has never had a car before, has himself driven his Darracq nearly 4,000 miles without a single stop on the road due to any defect or breakdown.

THE Darracq-Serpollet steam omnibus from London, has arrived at Glasgow, having covered the distance of 400 miles in 29 h. 6 min., running without accident or involuntary stoppage.

THE number of automobiles registered in the State of New York, U.S.A., up to August 1 of this year was 32,082. For the first seven months of 1906 the number registered was 8,210, as compared with 6,137 for the corresponding period in 1905—a gain of over 2,000.

A MOUNTED guard of thirty Life Guards was riding along Regent Street, London, when a motor-bus driver tried to pass on the near side, with the result that he broke the ranks and scattered the guards, some of the horses breaking away. Later, he was fined 40s. at Marlborough Street Police Court.

MOTOR horns that make too loud a noise are now under the ban of the police of Washington, U.S.A. Many complaints have been received by the authorities against motorists using whistles and sirens of such noise-producing power that horses and people alike are frightened when a blast is the only evidence of the otherwise silent approach of a motor-car.

WE had a short trial run on Tuesday last on a new French-built four-cylinder car, known as the S.C.A.R., the British agency of which has been taken up by the Central Motor Car Company, Ltd., of Long Acre, W.C. The vehicle is of 18-20-h.p., with cardan shaft transmission. Among the special features are a variable lift to the inlet valves, and thermo-siphon water circulation. We hope to refer to the new car more fully in a subsequent issue.

A PECULIAR accident occurred on Wednesday of last week just outside Scarborough, on the Filey road. Mr. T. H. Woollen, of the Clement-Talbot Co., was motoring to Bridlington when a horse ridden by a groom took fright and jumped almost over the car, breaking the mud-guard and doing other damage. The animal then fell on and rolled over the groom, who sustained a broken leg and concussion of the brain. Police investigation absolved Mr. Woollen from all blame.

## HERE AND THERE.

WE hear that a new British car shortly to be put on the market will be an exact copy of a well-known Italian vehicle.

MESSRS. J. W. BROOKE AND Co., who have lately received an order for one of their 35-h.p.

Brooke cars for Mexico, are informed that this is the first European car to be shipped to that country.

THE NEW SPEEDWELL MOTOR COMPANY, LTD., have acquired the business of the Speedwell Motor and Engineering Company, Ltd., 151, Knightsbridge, London, S.W.

MR. L. L. WHITMAN, who holds the San Francisco to New York record of thirty-three days, started on the 2nd ult. on another trip across the American continent on a 30-h.p., six-cylinder Franklin car.

THE new premises of Messrs. G. and T. Brown, in Bridge Road, Sutton Bridge, are on one of the chief motoring roads of the district, and are well equipped to deal with all motor-work that may be required that way.

A FRENCH automobilist paying his first visit to London was perplexed with the notice, "Cars stop here." He is said to have stopped until a passer-by, noticing the situation, told him it applied only to trams.

FROM the Syndicate d'Initiative de Lyon we have received a copy of an illustrated guide to Lyons and neighbourhood, which should prove interesting and useful to anyone contemplating a tour in that district of France.

THE Heaton Norris Council has discussed an application by the Manchester Corporation for a licence to run a motor-bus in Heaton Moor Road. Several members pointed out that motor-buses were unpopular and not desired in Heaton Moor, and the highways sub-committee were authorised to grant licences for horse omnibuses.

THE Academy of Motoring, Ltd., of New Bond Street, W., recently acquired two Metallurgique cars for hiring-out purposes. The two vehicles have been in constant use since the day following their purchase, for periods of a day, week, or month, and have not been idle more than six days during that time. The 24-28-h.p. double phaeton was purchased on April 22nd, and since then has covered over 6,000 miles, having been all over

Scotland; but the record of the 16-20-h.p. landaulet, of which we give an illustration, is even better. Bought on June 4th, in two months it had travelled roughly 4,500 miles all over the country, and has up to date done nearly another 1,000 miles, making a total of roundly 5,500 miles in less than three months. The landaulet has two fold-up seats, so that it accommodates four passengers inside comfortably.

MR. C. FRISWELL is at present enjoying an extensive tour on the Continent on a 30-40-h.p. Peugeot. From a post card from Milan we learn that, travelling *via* Lille, Paris, and Geneva, he reached Italy *via* the Simplon Pass. He describes the dust on the Italian roads as being "awful."

PETROL and motor spirit imported into Cape Colony has now to pay a duty of 1d. a gallon.

THE DAIMLER COMPANY inform us that Lord Leigh has ordered a 30-40-h.p. car of their make.

SIR HENRY KIMBER, Bart., M.P., has lately joined the ranks of motorists and is at present touring in Scotland.

THE Adler Motor Garage is being opened at 1, Church Street, Barking Road, London, E., with Mr. O. F. Hanington as manager.

THE motor-omnibus has already been introduced into Japan. Five are running regularly in Osaka, while an order for twenty-four more has been placed.

SIR DYCE DUCKWORTH has informed the Street Noises Abatement Committee that, in his opinion, the streets are unfit for two totally different kinds of traffic at the same time.

THE Statter quick-lift jack and many other motor-car accessories are now made by the Switchgear Company, Ltd., late Messrs. J. G. Statter and Co., Newhall Street, Birmingham.

WE illustrate herewith the safety motor filler which has recently been put on the market by Pettett's Patent Safety Filler Co., of Regency Square, Brighton. The object of the arrangement is to enable the contents of petrol tins to be emptied into the tanks of cars without danger and without the use of funnels. In the illustration the complete device is shown detached, from which it will be seen that, in addition to the spout, a small air pipe not only passes through it, but also well into the tin. The filler will be found useful in connection with awkwardly situated tanks, and it effects economy inasmuch

that there is no waste of petrol by splashing. Another advantage claimed is that it enables a tank to be filled at night without having to invoke the aid of a lamp, with its consequent danger, it being impossible to over-fill the reservoir, as, when the spirit in the latter comes flush with the end of the spout, the flow from the tin ceases owing to it becoming air-locked. All the petrol passes through a filtering gauze at the end of the filler, which is so arranged that it can be easily detached for cleaning purposes or renewal. Screw adaptors are supplied with the filler, enabling it to be used in conjunction with any of the different firms' petrol tins.

MESSRS. SALSURY AND SON, LTD., of Long Acre, W.C., have just brought out a new adjustable bracket for motor-car head lights. By means of a single nut the two arms of the bracket can be set in a variety of positions to suit any make or size of head light.

CALLING in at the depot of Gaulois Tyres, Ltd., the other day, we had an opportunity of inspecting a Gaulois cover which has been specially designed for use in conjunction with chrome-leather non-skid bands. The firm are also devoting attention to solid rubber tyres for motor-buses and are making one with steel studs with the object of reducing the danger of skidding.

THE Wolseley Tool and Motor Car Company, Ltd., have sent us a photograph of the motor launch Lila, belonging to Mrs. Hoffman, of Pangbourne, Berks. The hull, 35 ft. long by 5 ft. 6 in. beam, was built by Saunders, and is engined with a four-cylinder 16-h.p. Siddeley motor. A striking feature of the vessel is its reliability and silence, while it has attained the satisfactory speed of sixteen miles an hour.

THE MAHARAJAH OF ULWAR has recently acquired a 50-h.p. Brasier car.

THE HON. H. L. BRUCE, heir of the Earl of Aberdare, intends going into the motor-car business.

WE regret to learn of a serious fire at Mr. Max Graddon's motor-car body works in Mildmay Avenue, London, N.

THE Loch Lomond challenge trophy has been won by the 14-h.p. motor-boat Kelvin, owned by Mr. W. M. Bergius, of Glasgow.

SIR THEODORE MARTIN, K.C.B., is still unrepentant with regard to motor-cars, which he regards as "a curse to the community."

MESSRS. OAKES BROS. AND CO., 46, New Broad Street, London, E.C., will be glad to receive catalogues of motor-cars suitable for Madras.

WE learn that Messrs. Jarrott and Letts have received an order to build a special 40-h.p. Crossley landaulet for the President of the Republic of Chili.

CAPTAIN C. G. BIGHAM, C.M.G., who was secretary of the Motor Car Commission, has been appointed secretary of the new Commission on the lighting of the coast.

ARRANGEMENTS are being made for an examination for the A.C.G.B.I. certificates to be held at either Chelmsford or Colchester in the course of a few weeks. The date will be announced in the *M.C.J.*

WHILE a mail van running between Camberley and Windlesham was going towards Bagshot, the horse fell and both shafts were broken. Mr. Percy St. Gerrans took the mails on in his motor-car.

THE Hon. Reginald and the Hon. Sybil Fellowes were being driven in a motor-car over a narrow road near Ramsey, when a horse attached to a farm cart fouled their track. In order to avoid a collision the chauffeur applied the brakes and turned the motor-car into a dyke, the passengers escaping with a slight shaking.

MOTORISTS will appreciate, if it is thoroughly carried out, the new bye-law of the London County Council, prohibiting the throwing or depositing of "broken glass, nails, or other sharp substance, not being road material, on any street or public place." The word street as used in the bye-law "includes any highway, road, lane, path, footway, mews, square, court, alley, or passage to which the public have access for the time being."

A MATCH between an 8-h.p. Rover and a 10-h.p. Turner-Miesse car was run off at Rangoon recently. The local agents for the Rover challenged the representative of Simpson and Co., of Madras, who are agents for the Turner-Miesse, to an uphill test. The steamer was loaded up with five passengers, and ascended the hill easily. The Rover, similarly loaded, then essayed the attempt, and accomplished it after changing gear half way up. The times are given as 40 2-5 sec. for the steam and 53 2-5 sec. for the petrol car.

MESSRS. HALL CAPRIS AND CO. have sent us a copy of a handsomely got-up brochure they have just issued, giving an illustrated description of the Isotta-Fraschini cars, and also of the works in Milan in which they are built. At their depot in Riding House Street, London, W., Messrs. Hall Capris and Co. have just now an interesting range of the Isotta-Fraschini vehicles that have been displayed at the Milan Exhibition. They include 28-35-h.p. and 50-65-h.p. polished chassis, and several finished cars which are well worthy of inspection.

AN alarming accident occurred the other evening at Gorsty Hill, in the Midlands, which lies between Hales Owen and Blackheath. A steam motor-wagon, belonging to the Johnson Iron and Steel Company, of Hall End, West Bromwich, was being driven up Gorsty Hill. After proceeding some distance up the incline the driver stopped the motor-wagon for the purpose of altering the gear. Whilst he was doing this the vehicle jumped the scotches and commenced to run back down the slope at a rapid pace. The driver at once applied the brakes, but these failed to act, and, after traversing a distance of about 150 yards, the motor-wagon dashed with terrific force into a house at the bottom of the hill, knocking out the front of the dwelling and the gable-end.

## CONTINENTAL NOTES.

### The Provence Speed Trials.

The Automobile Club de Salon is organising a series of one and five kilometre speed trials for the 18th inst. The event, which will be held on the Salon-Arles road, will be open for tourists and racers, the usual categories being provided in each class. The big racing cars will compete for the Rothschild cup, while a number of prizes are being offered for competition in the other sections.

### An Austrian Touring Trial.

The Styrian and Carinthian Automobile Club is organising a touring and fuel consumption trial for the 7th, 8th, and 9th inst. The event is open for (1) motor-cycles, (2) single or double-cylinder cars up to 450 kilogs., (3) single-cylinder cars from 450 to 700 kilog., (4) two-cylinder ditto from 700 to 1,000 kilogs., (5) four-cylinder cars up to 32-h.p., and (6) ditto over 32-h.p. The Carinthian competitors will have a run from Klagenfurt to Gratz, 193 kilometres, on the 7th September; the following day there will be a joint run from Gratz to Klagenfurt via Leoben, 214 kilometres; while on the 9th the Styrian section will return to Gratz via Marburg, 193 kilometres. The winners

the touring motor-bicycles will be divided into three categories on a cylinder capacity basis, viz., (a)  $\frac{1}{2}$ -litre; (b)  $\frac{3}{4}$ -litre; and (c) 1 litre. The racers will have to cover three laps and the tourists two, giving total distances of, respectively, 140 and 94 miles. Entries will be received by the A.C.B. at 5, Place Royale, Brussels, until the 5th inst.

### The Coupe de "Matin."

The Coupe de "Matin" reliability trial, which commenced on the 2nd ult., was concluded on Tuesday by a run from Havre to Paris. The final results are not yet known, but, up to Sunday, when the competitors reached Boulogne, out of the 49 which started only 27 were still in the event, and of these only eight had a clean score, these comprising a Darracq, a Cottareau, a Clement-Bayard, a Mercedes, and four De Dions. The two Siddeley cars were still in the running, although, like the majority of the vehicles, they have lost a number of marks.

### A School of Instruction for Chauffeurs.

Messrs. Berliet, the makers of the Berliet cars, have decided to open a school for the instruction of chauffeurs at their works at Lyons. A special engineer, M. Lagier, has been engaged to give lessons two hours a day. The first course, which will last a month, will commence on September 3rd, and it is intended to

The French Military Manœuvres. One of the Motor Lorries (an Orion) employed in maintaining the Water Supply.

in each section will be the vehicles which most nearly approach the limits fixed both as regards average speed and petrol consumption. Thus the cars in Class 4—four-cylinder vehicles up to 32-h.p.—are expected to maintain an average speed of 33 kilometres (20 $\frac{1}{2}$  miles) per hour, and cover 6 kilometres on a litre of spirit, this allowance being equal to about 17 miles per gallon.

### Speed Trials at Marseilles.

On the occasion of the visit of M. Fallieres, the President of the French Republic, a race meeting is being organised to take place at Marseilles on the 20th inst., in connection with the automobile section of the Colonial Exhibition in that city. The races will probably be held on the Prado, over a standing mile and a flying kilometre.

### The Ardennes Motor-Bicycle Race.

The Belgian Automobile Club is organising a motor-bicycle race for the championship of Belgium. It is to be held on the 9th inst., on a 75 kilometre circuit, which, starting and finishing at Neufchateau, in the Ardennes, takes in Florenville, Herbeumont and Recogne. There will be two classes, viz., for racing machines and tourists. The former will be divided into two categories, viz., over 50 kilog. and under 50 kilog., while

start a fresh course at the beginning of each month. For those clients who do not desire to receive instruction in a class, special lessons will be given by arrangement. The lectures, besides being of a general nature, will deal with the different causes of stoppage and bad working of the motor, the taking down, assembling, and general lubrication of a car, the chassis used for demonstration being one of Messrs. Berliet's 1906 models. Special attention will be paid to the subject of ignition, while instruction will also be given in the police regulations and rules governing the road.

### Miscellaneous Items.

Twenty-one entries have so far been received for the reliability trial for the Coupe d'Auvergne, which is to be held from the 3rd to the 8th inst.—A Renard road train has just been put in service between Wimereux, Ambleuse, and Andresselles, near Boulogne.—The Volunteer Ambulance Corps in Munich has recently acquired a 24-h.p. Brasier car fitted with a special ambulance body.—The municipal authorities of Suresnes, near Paris, have forbidden the use of sirens on motor-cars.—All along the Saxon-Bohemian frontier large quantities of contraband goods, and especially cattle, are constantly being surreptitiously conveyed across the frontier. The Customs officers at Ebmath have, however, now been provided with a motor-car to run down the smugglers.

## CORRESPONDENCE

[Letters to the Editor should be addressed to the offices,  
27-33, Charing Cross Road, W.C.]

### THE EVOLUTION OF SPEED.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We are accustomed at the present day to extraordinary speed performances, but I cannot help but think that the achievement of the Dietrich team in the Ardennes race is so remarkable as to receive special mention entirely apart from the mere idea of an ordinary trade advertisement. The evolution of speed in connection with motor-cars during the last ten years has been a remarkable one. Individual performances have from time to time been achieved by various drivers on various makes of cars, but nothing approaching the achievement of the Dietrich men has ever been accomplished in regard to high speed reliability.

The distance of the race was 600 kilometres or about 375 English miles. Duray on his De Dietrich won in 5 hours 38 min. 39 sec. at an average speed of 66.440 miles per hour, Rougier finishing third, 11 min. 32 sec. later, at an average speed of 64.452 miles per hour, Gabriel fifth, 2 min. 3 sec. after Rougier, at an average speed of 63.878 miles per

Sir Horace Marshall's new 30-40-h.p. Daimler Car, fitted with special detachable limousine body by Messrs. Henry Whitlock and Co., Ltd., enabling it to be used as an open car with Cape cart hood.

hour, and Sorel seventh, 12 min. 24 sec. after Gabriel, at an average speed of 61.705 miles per hour, the performance of the latter being very fine indeed when it was remembered that this was his first appearance in a Continental road race.

Taking the average time of the four cars altogether the speed works out at 64.07 miles per hour for the team, the total distance covered by them being 1,500 miles. When it is remembered that three other cars finished in between these drivers it will be seen that the average speed accomplished by these seven men was considerably over that which I have mentioned, and as an evidence of the extraordinary reliability to be obtained from a racing car of the present day I think the result a marvellous one, as also is the performance of Wagner, who accomplished the first round of 85.714 kilometres i.e., 53½ miles, in the extraordinary time of 45 min. 29 sec. Four years ago, viz., in 1902, the average speed of the winner of the same race was just over fifty-three miles an hour, and yet within that four years such is the increase of speed that it is possible for eleven men to accomplish the distance at a much higher rate, and yet not be able to win the race in 1906.—Yours truly,

CHARLES JARROTT.

### THE DUST NUISANCE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR.—So much has been written and said on this subject lately from both the motorists' point of view as well as that of the public, not to mention the local authorities, that one can hardly add any-

thing new. A great many letters are written with strong and bitter prejudice and deserve little or no attention. Let us ask one or two questions and also try to answer them.

Has the motor-car come to stay and be an important means of transport, not a plaything of the rich or the few? If so, are our roads and streets in proper condition to receive this new form of traffic? Does the motor-car make the dust? No, the horses and iron-shod wheels of carriages and carts make the dust, and the motor raises it, and is therefore the immediate cause of the inconvenience or nuisance. Are not our local authorities doing their best to make dust by the constant overwatering of the road, which disintegrates the soil and makes a loose surface?

A great many preparations have been tried on the roads—some with greater success than others. Why not remove the dust by a cyclone cart and use it on the fields for fertilizing purposes? No good end is to be gained by abusing the motorist and the road authorities. Let them lay their heads together and devise some remedy. Difficulties are only made to be got over, and the road question is certainly not an insurmountable one.—Yours truly,

G. W. PATON.

### WEST SUSSEX AND ROAD-MAKING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Those who say that motor-cars are "primarily" responsible for the "dust" nuisance on our roads are misguided individuals. If they would take a ride from West Tarring to Horsham and exercise a little thought, I fancy the following questions would be asked:—

1. How is it that I see lengths of the road in the best of repair, and with practically no dust on it?

2. How is it that I see immediately adjoining these certain other lengths all cut up, and nothing but masses of dust and flints?

3. How is it that, taken as a whole, the part of the road south of West Grinstead (about ten miles) is more or less in a bad state, while north thereof, and right up to Horsham (another ten miles) the road has generally a most excellent surface?

Practically the same motor traffic passes over both stretches of road, and yet they are as different as chalk and cheese. I believe that intelligent observers would come to something like the following conclusions:—

1. Where the road is bad (as the traffic is equal on the bad and good parts) it must be caused by bad and untimely repair of the road, otherwise it would be all bad.

2. As the road south of West Grinstead is made and repaired with some granitic or quartz stone, the great difference in the two must also rest in the material used.

3. If I want good and much less dusty roads, I must make and mend with the material less likely to cause dust, and in a good way, and at that period of the year when they are likely to bind best, and not (by reason of dry weather and baking sun, or soft flints, soaked, and rolled by too heavy rollers) be liable to disintegrate directly they are formed and repaired.

Again, may I say (as the result of observation over some 10,000 miles of roads, including from Worthing to Edinburgh) that the authorities will find that a timely coating of tar on a well-made road will much preserve it, and, besides being a great convenience to all, also in the end, by reason of its "longer life," be little if any more expensive than the present way of making a good road and then leaving it. The Great North Road (running from Barnet to Berwick-on-Tweed), some 300 miles, is mostly made of blue granite, and is tarred over nearly all its surface, and is an excellent and practically dustless road; so it is evident that some authorities know what is right and proper, and it is therefore only for the others to educate themselves up to the same point. When this will be, and the dust nuisance stop, rests with them and their electors, and no one else. Motorists will welcome the happy day as much as others.—Yours truly,

HARRY NYE.

### AN ACCUMULATOR CHARGING QUERY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In addition to a small car, I have an old motor-cycle engine and low tension magneto, which I bought second-hand. I have been wondering whether it would be possible with the small motor and magneto to rig up a set by means of which I could charge the ignition accumulators of the car. I am quite a novice in electrical matters, so venture to ask if you or any reader of the *M.C.J.* will give me any information on the matter.—Yours truly,

NOVICE.

[A magneto machine is not suitable for charging accumulators, as it will only generate an alternating current, being really the simplest form of dynamo machine, in which the magnetism is provided by the permanent steel magnets, and the resulting current consisting of alternations in opposite directions, without any provision being made to commute or change their direction, so as to produce a current flowing in one direction. Though a magneto machine is really a dynamo, it differs from the machines generally described as dynamos in the following way. The field of force or magnetic field of the magneto is produced by permanent magnets, and the currents are not taken from a commutator

which will make them flow in one direction. In the dynamo, the field of force is provided by coils of wire which surround the poles of iron magnets, producing a temporary magnetic effect, when current is passing through the coils, and the commutator provided with such machines collects the currents so that they flow or are delivered to the circuit in one direction. A magneto machine is only suitable for giving a spark or flash].

### THE STEAM CAR CHALLENGE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to Mr. Coleman wishing to race my six-cylinder Napier touring car, which Mr. Cecil Edge drove at the South Harting Hill Climb, it is quite unnecessary for Mr. Coleman to write long letters on the subject. I am prepared to run my ordinary standard six-cylinder Napier touring car as run at South Harting Hill against a standard 18-h.p. steam car, run as run by the ordinary purchaser and not faked in any way, the arbitrators as to both cars being an official of the Automobile Club and a technical gentleman connected with the motor Press.

It must be quite clear that Mr. Coleman's car is to be used exactly as a car is used and sold to the ordinary purchaser.

Mr. Coleman can run off the match in the Graphic Trophy Race if he likes and the Club will allow us to do so, and run it as a private match at the finish of this meeting, or my car can go over to France and

### A PEDIGREE DOG.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Supplementary to the Comment in your recent issue on dogs and motorists let me give my experience. I was unfortunate in running over a terrier, but no blame was attached to me in the matter. I believed that the dog was dead, as it did not move, and a man came up and said that he was the owner, that it was a "pedigree" dog, and that he had just refused a sovereign for it. Well, I do not know much about dogs, but I am sure that its pedigree must have been mongrel for many generations. I refused to give the man any recompense, but handed him my card. I give below an exact copy of a letter which I received from him two days afterwards.

"Dear Sir,—Calling your attention to the accident that occurred on Sunday morning the 5th the expenses were only 5s. but as it spoilt the dogs mouth and like wise the sale of the dog which is a Pedargre dog.—From yours truly."

I thought, however, that the dog must be dead, and that this was a "try on," and therefore communicated with the Chief Constable at R——, saying that if the dog were alive, and that 5s. had been incurred for veterinary expenses, I should be pleased to pay it without prejudice.

The Chief Constable replied as follows:—

"Sir,—I beg to acknowledge the receipt of your letter of the 7th inst., and in reply, to inform you that, from inquiries made, the dog

Perpere on the Germain Chainless Car he drove in the recent race for the Coupe de Liedekerke. The vehicle secured the second place, being beaten by only 2 min. 13 sec., and made the fastest lap in the contest, viz., 53½ miles in 1 hr. 3 min. 46 sec., equal to a speed of just over fifty miles per hour.

run in the Mont Ventoux Hill Climb. This competition seems to be most suitable, as it will give Mr. Coleman what he wants—a ten kilometre hill climb. That is, I understand, where he claims the car excels.

I hope Mr. Coleman will pardon my reminding him that this match is not of my seeking, that he has thrust it upon me, and that he must not complain if I hold him down to genuine touring cars as sold to the public, and not cars such as have been passed in some hill climbs. I feel sure that Mr. Coleman will appreciate my desire that I should not use a faked petrol car such as I believe he has had to run against in some competitions.—Yours truly,

S. F. EDGE.

### AN ACCUMULATOR QUERY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have an accumulator, one of the type usually supplied by the Wolseley Company, viz., two two-volts coupled. Would you or any reader of *M.C.J.* advise me how to prevent the terminals from getting a thick brown corrosion? What is the matter with the accumulator, is it showing signs of decay? Its age is about two years, and it has always been handled with care.—Yours truly,

W. RIDGWAY.

[A reply to the query raised by our correspondent will be found elsewhere in the present issue under the heading Current Topics.]

referred to does not belong to the man. This dog followed him home about a week ago, having been left behind by a ship that was in this port. The dog is still alive, and no expenses have been incurred with a veterinary surgeon. He has only used a little oil on the dog, and it has now recovered.—I am, Sir, your obedient servant, &c."

I think this may be a warning to other motorists to think twice before recompensing anyone who claims to be the owner of a dog which they may have been so unfortunate as to run over.—Yours truly,

A. DUCKHAM.

### THE HORSE POWER OF PETROL CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In view of the great variations which exist among different manufacturers in their methods of estimating the power of their engines and cars, the A.C.G.B.I., or one of the organizations connected with the motor trade, would do a service by establishing a standard brake horse power test, and licensing official testers in various parts of the country, who would make the standard test of any motor for the manufacturer, for a specified fee, and issue a certificate to the manufacturer which he could use in his catalogue. Various methods are now adopted to ascertain brake horse-power, and, notwithstanding the claim made that all engines of a given size should develop and deliver approximately the same amount of power, it is a fact that not only do the motors of different makers vary greatly in the amount of power developed for the same

cylinder dimensions, but all the engines of the same size produced by the same maker do not deliver the same amount of power. There are many conditions besides the size of the cylinder which vary the amount of the power developed. For example, the shape of the combustion chamber, the location of the sparking plug, the strength of the spark, the timing of the ignition, the size, lift and timing of the valves, the size of the fuel supply pipe, the fit of the piston and piston rings, also the type of piston rings, the bearings, the lubrication, &c. As each one of these features has a direct bearing on the power developed, it is impossible to consider that cylinder dimensions or piston displacement are adequate guides to the b.h.p. of any motor. From the best to the worst condition on almost any of these features there may be a difference of 50 per cent. in the power developed.

It is the practice in almost every factory to require petrol engines to develop a certain standard power. That is, the motors are tested under a brake or by some other method, and if they do not come up to the required mark set by the manufacturers, they are overhauled and brought up to the proper power, or, if this is found impossible, rejected as imperfect. This is all right as far as it goes, but each manufacturer has his own way of making his tests, and the difference between the most strict and the most liberal method could easily be from 25 to 50 per cent.

If a standard brake test were established and manufacturers

Duray, the winner of the Circuit des Ardennes, was given a hearty welcome by the workmen at the De Dietrich factory at Luneville. The photograph produced above shows the victorious car under the triumphal arch they erected in honour of his success.

subjected all their engines to the same test there would naturally be more effort towards perfection in all details.

There need be no trouble to induce manufacturers to have their engines tested by official testers, for those makers who have confidence in their product should welcome the opportunity to show the merit of their engines, and after they had started the movement the public would demand that all motors be subjected to the same test before they would purchase. A move of this kind would increase public confidence enormously, and be of great benefit to the trade.—Yours truly,

PRESTONIAN.

#### A NOVEL SUGGESTION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the novel suggestion of a medico-motorist in the last issue of the *M.C.J.*, if inferior workmanship or qualities of metals is the fault of the makers, why not write to them? If they do not treat him fairly, which they probably would, providing that it is a genuine firm, then it would be time to show them up publicly. Probably the breakage of the crank shaft was his own fault; in fact, I should not be surprised to hear of more crank shafts breaking, in view of the way engines are treated. I have seen dozens of drivers, so-called mechanics, &c., racing their engines when the car is stationary, causing unnecessary

wear, tear and strain on the crank shaft. This, I dare say, occurs every day throughout the year, and when you ask them what they are racing the engine for, as I have done on numerous occasions, they say that they don't know.—Yours truly,

H. HUDDLESTON.

#### BRAKES FOR MOTOR-BUSES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Your correspondent refers to the operation of foot and hand brakes on the road wheels as if it were a novelty. I owned a Gordon Bennett Wolseley which was driven in Germany by Mr. Girling, and this car was so fitted, and I believe the Wolseley Company adopted this plan on other vehicles built by them. It is amusing to see how people are discovering and claiming designs of other people.—Yours truly,

W. O. SPILLER.

#### WHISTLES ON CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Will you kindly inform me if whistles are allowed on motor-cars in England and Ireland?—Yours truly,

AN IRISH MOTORIST.

[They are not prohibited by law, but public taste is against their adoption on this side of the Irish Sea. The regulation with regard to the matter is to be found in Art. 3 of the 1896 Act, which says "every light locomotive shall carry a bell or other instrument capable of giving audible and sufficient warning of the approach or position of the carriage."]

#### FUEL CONSUMPTION AS A CRITERION OF A CAR'S CONDITION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was very much interested in your remarks on this subject in a recent issue of the *M.C.J.* In my own experience I have found that one cause of a progressive decrease in fuel efficiency and of power is the gradual wear of the exhaust cam, and the ends of the valve stem and the push rod. The result of this is a reduced exhaust valve lift which throttles the outgoing gases, producing a back pressure of explosion, the consequence being that while the same amount of fuel is burned at a given throttle opening the production of power is reduced. The same reduction of lift, due to wear of the operating parts, may affect the inlet valve as well, with the result that a lessened charge is admitted to the cylinder and less power produced per stroke, but this defect produces the same effect as throttling and has not much influence upon fuel economy.—Yours truly,

W. J. L.

#### MATERIAL FOR VALVE GRINDING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—There seems to be quite a diversity of opinion as to the best material for use in connection with the operation of valve grinding. Some motorists recommend powdered emery, others ground oil stone, and even glass. Still others use a paste formed by mixing the abrasive material with oil, dabbing the face of the valve in one or two spots, while I have heard that in some cases the valve face is covered with oil and then sprinkled with the cutting substance. Then, as regards the best method of valve grinding, I have been recommended to spin the valve backward between the hands, while others tell me to merely turn the valve in one direction a part of a revolution, lifting it from its seat each time. I should be glad if some readers of the *M.C.J.* would give their views as to what they consider constitutes the best practice.—Yours truly,

G. MULLINER.

#### A JERKY CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Can any reader of the *M.C.J.* enlighten me as to what may be the cause of the following trouble? When running on top speed, my Darracq car goes with jerks, which most certainly does harm to the mechanism. The second speed is all right; I have altered the clutch spring from tight to slack, but this makes no difference.—Yours truly,

W. JOHNSON.

[We should imagine that the trouble was with the clutch, and would advise treating same. Wash well out with paraffin and put a little fuller's earth on the leather to prevent slipping.]

PARAFFIN BURNER FOR STEAM CARS.—"C. J. H." writes: "Would some reader of the *M.C.J.* give me a design for making a good paraffin burner, suitable for a Locomobile steam car?"

TOOLS LOST.—On August 19th, on the road between Ringwood and Wimborne, an aluminium folding jack, Pullman tyre lever, and tyre gaiter were lost by the bottom board of the tool-box becoming loose. The owner was informed that some of these had been picked up about two miles from Wimborne, but on returning could not discover finder, who is requested to return same to Mr. R. W. Buttemer, St. Mary's, Godalming, when he will be rewarded.

## ALCOHOL AS AN ALTERNATIVE TO PETROL.

BY RADFORD COOKE.

THE subject of alcohol from farm produce as a motive power appeals to me as being one that, in the interests of two important industries—i.e., the agricultural and motor—is neglected in this country. In fact, the alcohol movement seems to be in a state of paralysis, due probably to the fact that, on the one hand, the motor industry is waiting for the active Government lead and encouragement which it is entitled to expect, whilst, on the other hand, the Government is waiting for the problems attending the use of alcohol as a fuel to be solved, when we are promised they will immediately act. It seems to me that in these circumstances it is the Governmental duty to take the initiative by actively encouraging the solution of this extremely important national problem, which is destined in the more or less near future to set in motion such economic and industrial changes as seem difficult to contemplate.

Foreign Governments have for many years been fully alive to the vital necessity for an indigenous fuel which is at the same time inexhaustible, seeing that the progress of the motor industry depends entirely upon the necessary fuel being forthcoming in increasing quantities for many years to come, and when mechanical locomotion has completely established itself the regular consumption of fuel will probably be much larger than is at present realised.

It is to be feared also that the time is within measurable distance when, with the inevitably rapid increase in its consumption for fuel purposes, the output of the petroleum products will be no more than sufficient for the needs of the countries which produce them. It is quite recognised that these changes may perhaps take many years, but the changes to be effected before the home-produced substitute is available in sufficient quantity will also take a considerable time.

We all know how forcibly the German Government realises the importance of this question, and the steps which have been taken towards a solution. The German authorities have actively encouraged experiment and research for many years by subsidising and offering prizes; in fact, so successful have their efforts been that a very considerable and rapidly increasing number of slow speed motors with alcohol as a fuel are at the present moment regularly employed in that country. Agricultural and chemical societies vie with each other in encouraging the production of a suitable fuel for high-speed motors, and at any moment we may hear that the difficulties in the way of a thorough solution have been overcome. They have two societies devoted to the subject of industrial alcohol, viz., the Experimental Fermentation Institute and the Society of Alcohol Manufacturers, and the whole organisation for its manufacture and distribution is complete. In fact, the spirit actuating the whole population, from the Emperor downwards, is that of the higher patriotism.

In France, too, the extraordinary patriotism which this question of alcohol from farm produce as a motive power has evoked is common knowledge. The Government have encouraged its use by every means in its power, nothing daunted by repeated negative results; in fact, at this moment they are more determined than ever in their active encouragement of experiment and investigation. In France, also, the agricultural societies throughout the country have been most active. In all automobile trials and sports, special prizes are invariably offered for the best results obtained with alcohol as a fuel, and at the annual Salon a special feature is regularly made of the alcohol question. This remark applies equally to the agricultural shows throughout the country; in short, every possible opportunity is seized upon to encourage the ideal and to keep it prominently before the public mind. The Government have even gone so far as to organise trials on several occasions, and have provided handsome prizes with the object of encouraging the use of alcohol. Quite recently, also, they have announced an offer of two prizes of £2,000 and £800 respectively for a suitable denaturant. The A.C.F. is responsible for the statement that not only their own laboratory but many other bodies throughout the country are "ceaselessly" experimenting and investigating with the subject of alcohol as a motive power for high speed engines.

The same applies to Austria, where they held the now historical International Alcohol Exhibition in Vienna in 1904; to Russia, where a prize of something like \$5,320 is awaiting the discoverer of a satisfactory denaturant (and this in spite of their many other serious preoccupations of late); to Italy and Belgium, where numerous trials and exhibitions in connection with this question have taken place; to America, even, the home of the petrol monopoly, where the agitation for free alcohol has resulted in a Government Bill being passed by Congress. Thorough investigation of the subject is being conducted on behalf of the Government through the Department of Agriculture; and, further, the Automobile Club of America has announced a special contest for motors using alcohol as a fuel. Surely, if this action is necessary over there, it is quite doubly necessary in this country, importing as we do our petrol supplies largely from America.

What I wish to emphasise is the fact that although to our own insulated knowledge most other countries have seriously taken up this question and every effort is being made to encourage the patriotic ideal of a home-produced fuel, this country has so far not deemed it necessary to move, although the fact remains that, considering the relative positions, we should have been early in the field to consider the situation. On the other hand, not only has nothing been done, but, extraordinarily enough, the Report of the Departmental Committee on Industrial Alcohol, if it did not actually throw cold water on the idea, certainly

did not give much inducement or encouragement to agriculturists and motor manufacturers to put their time and money into it.

This has forced the conclusion upon me that a separate society should be formed to take up energetically this important question and do something to actively interest the country at large, and the agriculturists and motor manufacturers in particular. If we could get the Government Departments which are immediately concerned, viz., the Board of Agriculture, the War Office, the Admiralty, all more or less directly interested in the substitution of alcohol as a fuel, on the one hand, and motorists and agriculturists on the other, to take the matter up seriously the solution would be simply a matter of time, as we have it on the highest authority that the difficulties to be overcome are by no means insurmountable. Let us cease buzzing round this subject and get right into it. Let us collect data from all over the Continent, let experiment and research be actively encouraged by the Government, let us distribute all the information available broadcast, and arrange that no motor, agricultural or chemical show takes place without the subject receiving the prominent attention to which it is entitled. Let us arrange suitable lectures before agricultural, motor and chemical societies, chambers of commerce and other bodies interested throughout the kingdom. Let prizes well worth winning be offered. Let us, with the co-operation of the Press, open an energetic Press campaign.

We know that petrol is cheaper in this country than in most Continental countries, but that price is quickly becoming a serious item, and when it is, apparently without any good reason, increased as it has been lately by twopence a gallon, it should bring home to us how alarming is the situation, seeing that we are perfectly helpless in the matter, and should be equally so if it were to be raised again to-morrow by another sixpence a gallon. We will not dwell on the fact that, apparently, as the price goes up the quality proportionately comes down.

We have it on the authority of Sir Boverton Redwood and others that supplies are by no means inexhaustible, and on the authority of Professor Sir James Dewar that if the use of petrol continues to increase, as it inevitably must for several years to come, the objectionable exhaust gases will become a danger to public health, in which event there would be no alternative for the Government but to step in and prohibit its use.

It is said that a new society is not necessary. With this view I cannot agree. The hands of the Automobile Club are already too full, and the subject is far too important and far reaching to be treated as an offshoot or department. What is more, other interests are concerned besides those of motorists. No one, I think, will contend that the Club is an ideal institution for dealing with agricultural interests, which are those most largely concerned.

Nor can it take into consideration the Colonial possibilities of the situation, by which land at present idle might be made to produce sufficient farm produce suitable for the making of alcohol not only to make the empire independent of foreign supplies, but to be a source of revenue by exportation. It seems to me that, with our colonies, we are in a far better position to produce alcohol from agriculture than any other country in the world, whether the material be potatoes, beet, sawdust, rice, grain, or anything else from which it can be distilled.

In my view petrol should not be looked upon as anything but a temporary makeshift to be used only until the time when a home-grown fuel is available, and I firmly believe that, with the solution of the difficulties which at present attend the use of alcohol as a fuel, the price will be fixed without reference to the price of petrol, seeing that it is but a stop-gap fuel, and as a permanent one is quite out of the question. Probably it would be a good thing if the ultimate outcome were that the Government stepped in at the proper moment and announced a State monopoly of industrial alcohol. This is practically what has been done in Germany. It is with this possibility in view that I urge that the Government should render State aid if necessary at the beginning, and in every other possible way encourage the thing, as they are doing abroad. Now also would be the time for the Government to be laying in skeleton the foundations of this State monopoly. As regards the fears of a decreased revenue, there is no doubt that ultimately, with free alcohol, the revenue would gain considerably by the increased national prosperity following the stimulus to existing industries and the springing into life of new ones.

## NEW COMPANIES REGISTERED.

AUTOFABE.—£1,000. Motors, omnibus, car, van, and cab proprietors. 11, Queen Victoria Street, E.C.

BRITISH DELAHAYE AGENCY.—£50,000. To adopt an agreement with Mr. G. Garnier, and to carry on in Great Britain and elsewhere the business of agents for motor vehicles and motor-boat engineers and builders, &c. 203, Strand, W.C.

IRISH AUTOMOBILE CLUB.—Registered (members being liable to contribute to assets in event of same being wound up), to establish and maintain a club in Ireland for the encouragement and development of the automobile vehicle and other allied industries, and for accommodation of members of the company and their friends. Registered office, 34, Dawson Street, Dublin.

CAR AND GENERAL SYNDICATE.—£5,000. Agreements with the Pullcar Motor Company and Mr. T. J. Ridge. 3-4, Clement's Inn, Strand, W.C.

## CLUBS AND ASSOCIATIONS.

## MOTOR YACHT CLUB.

THE garden party given by Lord Montagu of Beaulieu to the members of the Motor Yacht Club took place on Saturday last in fine but windy weather. Many members chose to go to Beaulieu by road in preference to water. Dolores started off first, with Mr. Butler steering, and ran nearly down the Solent to Yarmouth before turning back for Beaulieu. Next came Chrysopraxe (Mr. H. Brickwood). He brought up just above Bucklers Hard and conveyed his party the rest of the way in the little motor dingy that has become so familiar in the club handicaps. Sea Urchin (Mr. Stuart Forster) and Controller (Commander Mansfield Cumming) followed soon after, both bringing their passengers up to Beaulieu. Mr. Clift, of Benbridge, also brought the Joan. Close upon 100 members had accepted the invitation, but, owing to the inclement appearance of the weather, only about half that number turned up, thus missing what was undoubtedly one of the most pleasant functions of the Motor Yacht Club's season. The thanks of

The Motor-Cycling Team Competition at Daventry. One of the competitors returning to the Starting Point.

the club are due to Lord and Lady Montagu for so kindly entertaining its members.

## MIDLAND.

THE series of closed competitions organised by the Midland Automobile Club concluded on Saturday last, when the consumption, brake, silence, vibration, smoke, and appearance tests were held at Moxhull Park, the residence of the secretary, Mr. T. H. Ryland. Saturday was a very rough day—almost a gale was blowing—and both the refreshment tent and the scaffolding and covering by the levels where the petrol was measured were nearly wrecked. The results of the competitions are appended.

It is of interest to note that Mr. C. W. Dixon's 12-h.p. Lanchester, which won the consumption trial last year, wins again this year, having consumed 172 ounces of Giant motor spirit over the course of forty-six and a half miles, being at the remarkable average of forty-three and a quarter miles to the gallon. The figure of merit for the consumption trial was arrived at by dividing the weight of each car and load by the number of ounces of petrol consumed.

The difficulty in working trials of the nature of these is to find scientific means of drawing comparisons. The brake trials were determined by means of a machine invented by Mr. F. W. Lanchester (a pendulum accelerometer) which was fixed to each car and showed upon a diagram the maximum braking effort when the car was running at about twenty miles per hour, the brake being applied upon the judges' direction. Each brake was tested separately and then both together, the prize being awarded to the best mean of the three

results in each case. The figures give the negative acceleration in feet-seconds per second in every case.

The remaining trials were judged by the judges, with the exception of the appearance test, which was decided by a ballot of all the officials. The silver cup awarded by the club to the winner of the aggregate of the above competitions and also of the closed reliability trial and hill-climbing goes to Mr. Cecil Edge, Mr. C. W. Dixon received a gold medal for petrol consumption, and silver and bronze medals are respectively awarded to Mr. P. D. Lee and Mr. Cecil Edge. For the brake trial the club's gold medal goes to Mr. P. D. Lee, and the silver and bronze medals respectively to Mr. H. F. L. Hemmings and Mr. G. H. Lanchester. For the silence, vibration, smoke, and appearance tests the gold medal goes to Mr. Cecil Edge, and the silver and bronze medals respectively to Mr. P. D. Lee and Mr. S. C. Harrison.

The thanks of the club are due to the hon. sec. for the use of the ground, and to Messrs. R. M. Greaves and W. Ballin Hinde, the judges, and to Messrs. A. G. Johnson, M. C. Blewitt, E. Fuhrman, Clarke, C. A. Baker, J. Rollason, A. W. Keep, F. W. Lanchester and other gentlemen who were good enough to assist in carrying out the trials.

Details of the contests are appended.

## CONSUMPTION TRIAL.

Driver.	Car.	Weight in lbs.	Spirit Figure in Ounces of Merit
1. C. W. Dixon	12-h.p. Lanchester	3,339	172 19.412
2. P. D. Lee	15-h.p. Siddeley	3,696	252 14.668
3. Cecil Edge	40-h.p. Napier	4,683	357 13.118
4. H. F. L. Hemmings	20-h.p. Lanchester	3,409	348 9.796
5. G. H. Lanchester	20-h.p. Lanchester	3,437	354 9.715
6. S. C. Harrison	16-22-h.p. Isotta Fraschini	3,598	492 7.313

## BRAKE TRIAL.

Driver.	Car.	Marks.			Figure of Merit.
		Both Brakes.	Foot Brake.	Hand Brake.	
1. P. D. Lee	15-h.p. Siddeley	10.6	10.6	7.8	9.66
2. H. F. L. Hemmings	20-h.p. Lanchester	9.3	8.9	8.9	9.03
3. G. H. Lanchester	20-h.p. Lanchester	9.6	7.0	9.4	8.66
4. Cecil Edge	40-h.p. Napier	9.7	11.0	4.3	8.33
5. S. C. Harrison	16-22-h.p. Isotta Fraschini	9.3	7.1	5.8	7.4

## SMOKE, APPEARANCE, SILENCE, AND VIBRATION TRIALS.

Driver.	Car.	Marks.				Figure of Merit.
		Vibration.	Smoke.	Silence.	Appearance.	
1. Cecil Edge	40-h.p. Napier	500	400	500	500	1,900
2. P. D. Lee	15-h.p. Siddeley	400	450	400	472	1,722
3. S. C. Harrison	16-22-h.p. Isotta Fraschini	300	450	375	476	1,601
4. G. H. Lanchester	20-h.p. Lanchester	250	500	350	455	1,555
4. H. F. L. Hemmings	20-h.p. Lanchester	250	500	325	466	1,541

## YORKSHIRE.

A MEETING of the Yorkshire Automobile Club and its affiliated branches will take place at Ripon on the 15th inst., where tea will be served at the Unicorn Hotel, at 5 p.m. Members may leave their cars in the Market Square, in front of the hotel, or avail themselves of the Hotel Garage.

## WEST ESSEX.

A SPEED judging competition was held by the West Essex Automobile Club, over a thirty miles' course, at Upminster, on Saturday, with the following result:—F. A. H. Hardy, Phoenix Antoine tri-car, 1; V. Baldwin, 3½-h.p. Brown, 2; A. Newman, 3½-h.p. Vindec, 3.

## WEST SURREY.

A RUN to the New Forest was held on August 18th, but, owing to the absence of many members during the holiday season, was somewhat sparsely attended. Sixteen members and friends met for lunch at the Black Swan, Winchester, but of these only eight, on three cars, followed the rest of the programme. Saturday and Sunday night were spent at Lyndhurst, the Crown Hotel proving most comfortable headquarters, and Sunday's run including Wimborne, Swanage, and Bournemouth. A visit to Beaulieu Abbey and Lymington preceded the return on Monday. The last invitation meet of the season took place at Rydeshill Guildford, on Saturday, when Mr. and Mrs. Williams entertained over

100 guests, the members present including Mrs. Bullerd, Mr. and Mrs. Buttemer, Mr. Crothers, Col. Elias, Col. and Mrs. Fairtlough, Messrs. Fletcher, Ledebor, Ponsford, and Warne, Mrs. Noble, Miss Houghton, Col. Swaine, and Mr. and Mrs. Pullman.

The remaining fixtures for the season consist of a hill climb for members at Blackdown, to-day (Saturday) and consumption trials on the 15th inst. over a twenty mile course.

### CHINA.

THE Automobile Club of China, which was founded about a year ago by Mr. G. E. Tucker, who became the first hon. secretary, has its headquarters at Shanghai. It has thirty-six members and intends to establish a garage, in charge of an expert from abroad, for the convenience of local motorists.

THE Automobile Club of North Wales will hold a gymkhana at Treborth on the 10th inst.

THE Nottinghamshire Automobile Club is asking its members to drive slowly through the village of East Stoke, near Newark.

ON Sunday, the 23rd, a full assemblage of members of the Essex Motor Club is asked for at Snarebrook, when a photographic group of the club will be taken.

THE Southampton Wheelers' Cycling Club has had a successful motor cycling hill contest, the best performances being made by Messrs. Blois and Winckworth on 5-h.p. Rex motor-cycles and Mr. Prince on a 3½-h.p. Raleigh.

### MOTORING IN ULSTER.

A RELIABILITY run from Balmoral, near Dublin, to Castlewellan, a distance of forty-three miles, under the auspices of the Ulster centre of the Motor Cycle Union of Ireland, took place on Saturday. Four started in the car section and eleven in the single cycle section, no competitors taking part in the third. The afternoon was remarkably fine and the road in good condition.

The following made non-stop runs:—

SECTION A, Cars.—J. N. McCommond, 16-h.p. Darracq; R. Dunlop, 10-h.p. Humber; T. Ireland, 10-12-h.p. Humber; T. Sloane, 8-h.p. Rover, one stop.

SECTION B, Motor-cycles.—G. McGladdery, 3½ h.p. Rover; G. Kirkpatrick, 3-h.p. Rover; H. G. Ferguson, 2½-h.p. Minerva; J. Williams, 2½-h.p. Minerva; J. Stewart, 3-h.p. Triumph. Also competed, J. H. Jordan, 3½-h.p. Bat; A. Bullock, 3½-h.p. Victor Jap; G. Gamble, 2½-h.p. Minerva; H. A. Connell, 3½-h.p. Minerva; W. J. Chambers, 2½-h.p. Minerva; J. Miller, 2-h.p. Peugeot.

### MOTOR VAN AND LORRY TRIALS.

THE following letter has been sent to the members of the Motor Van, Wagon and Omnibus Users' Association:—

Dear Sir,—A somewhat grave situation has arisen between this Association and the Chairman of the Automobile Club, acting on behalf of his committee, in regard to the contemplated commercial motor vehicle trials. In April last I, as your chairman, in conformity with various letters addressed to your committee by users, and after careful deliberation at a committee meeting held here, wrote to the committee of the Automobile Club urging that there should be no further delay over the long-promised trials, and offering the assistance of this Association. The Club committee referred the matter of the trials to its technical committee, and a joint committee, composed of members of that technical committee and members of the committee of this Association, was eventually formed. A programme of trials and rules therefor was then drawn up by this joint committee, and your representatives on that committee were fortunate enough to be able to arrange for the co-operation of two very large users, Messrs. Carter Paterson and Company and Messrs. Pickfords, who agreed to test, under service conditions, a certain number of competing vehicles for a sufficiently long period to prove their durability in regular work.

When the rules were printed in draft form and ready for approval, the Chairman of the Automobile Club wrote to the Chairman of its technical committee stating that the trials could in no event be carried out by a joint committee of the Automobile Club and this Association, and the practical result of this was that the Chairman of the Automobile Club, whilst quite ready to accept the assistance and support of your committee, wished its effective share in these trials, which are obviously of such vital interest to members, to end with the preparation of the rules. In the hope of providing a solution which might be acceptable to all parties, and as proof of the conciliatory attitude which this Association desired to adopt to support the authority of the Automobile Club, a written application was made to the Club for a permit to allow this Association to conduct the trials itself under the competition rules of the Club, but the Club committee refused to grant this permit.

The position in which your representatives on the committee of this Association were thus placed was held by them to be one in which they could not in any way look after and protect the interests of users of commercial motors, and, as Messrs. Carter, Paterson and Company and Messrs. Pickfords stated that their offers would not hold good unless at least half representation on any trials committee was accorded to this Association, I, after consulting and obtaining a unanimous vote of your

committee, was instructed to inform the chairman of the Automobile Club that the only terms on which this Association could co-operate in the trials were in accordance with the following clause, which was to be printed on the front page of the regulations:—

"The following regulations have been prepared by a joint committee of the Automobile Club and the Motor Van, Wagon and Omnibus Users' Association, and the trials will be conducted by a joint committee composed of equal numbers of the committees of both bodies."

This was refused by the chairman of the Automobile Club, who stated that a joint committee to conduct the trials was out of the question.

I send you this letter in order that I may learn whether the course that has been adopted by the committee of this Association meets with your approval, and whether you think we should take steps to carry out commercial motor trials on our own account, independently of the Automobile Club. I should also value your views as to whether this Association gains by any connection with the Automobile Club of Great Britain and Ireland in matters which exclusively concern business vehicles.—Yours truly,

R. E. CROMPTON, Chairman.

### THE DU PRE COMPETITION.

WE are officially informed that a protest was received in the Du Pre Competition of the Automobile Clubs of Nottinghamshire, Leicestershire, and Derbyshire against Mr. Barron's 10-h.p. Peugeot, on the ground that the size of the bore and stroke were incorrectly stated in his entry form. The clerks of the course have adjudicated upon this protest, and have awarded the cup to Dr. R. G. Hogarth's 12-16-h.p. Clement-Talbot, the car next in order.

Mr. S. Adams, of Moneymore, co. Derry, Ireland, at the wheel of his Wolseley Car.

Mr. Adams, who was quite a novice when he commenced motoring, writes that "from my own experience no man of moderate means, provided, of course, that he has a taste and also time for mechanics, need fear to venture on motoring."

### ROAD REPORTS.

KENT.—Mr. H. P. Maybury, the County Surveyor of Kent, in regard to the dust nuisance, states that the use of the best known macadam for repairs is one of the surest methods of minimising it. The numerous dust-laying experiments he has made are costly. The most effective and permanent of the various experiments is the tar paving of the surface. Considerable damage has been caused to the roads by extraordinary traction engine and heavy motor traffic.

SUSSEX.—The surface of the Petworth and Arundel road is reported to be in a very bad condition.

BUCKINGHAMSHIRE.—At Chesham some discussion has taken place with regard to the condition of the highways leading from that town, and the Buckinghamshire County Council is being communicated with.

BRIGHTON.—The Brighton Corporation have tried tarring one part of the roads with calcium of chloride, carbide, &c., on another, and another preparation on a further portion of the sea front, with the result that now they have practically no dust, to the greater comfort of everyone.

ALDERSHOT.—The War Department are attempting to solve the problem of dust on the main roads near Aldershot, by experimenting with granite laid with a mixture of sand and tar well rolled in. A mile and a half of the main Queen's Avenue is laid in this way, and the results so far have been most satisfactory. The heavy military traffic and constant passing of motor-cars and motor-buses have no effect upon the splendid surface.

CAMBRIDGE.—The Town Council has decided to allocate £35 to the tarring of roads in the borough. In coming to such a decision the

Council was influenced by a letter from the surveyor of Huntingdonshire, who said he considered the life of the road was increased by quite 50 per cent. by tarring.

**PERTSHIRE.**—In their annual report to the Perth County Council the Highland District Committee state they found by experience that binding the road metal with chivers sprayed with hot tar was a success, not only in improving the surface of the roads, but also in saving the wear of the metal, and as materially reducing the dust caused by motor-cars. The principle is now being adopted generally on the main roads in the district.

**TEDDINGTON.**—The District Council has decided to purchase two more tons of calcium chloride with which to further experiment in dust-laying. The utmost satisfaction has been given to the residents in Kingston Road by the adoption of this method of laying the dust.

### MOTOR-CYCLE CHAMPIONSHIP.

THE annual team competition among the motor-cycling clubs took place at Daventry. Five clubs had entered—viz., the Motor Cycling Club, Coventry Motor Club, Birmingham Motor Cycle Club, Cardiff Motor Club, and Naval Motor Club (Portsmouth), but the two latter scratched. The teams each consisted of six competitors—viz., four riders of motor-bicycles and two drivers of passenger machines. The course was to Gibbet Hill and back, and had to be covered four times, making a total distance of one hundred miles.

When fifty miles had been covered S. C. Perryman, 44-h.p. Perryman, of the Birmingham Club, and S. G. Frost (34-h.p. Minerva), of the Motor Cycling Club, had both been put out of the competition through faulty belts, while G. Spicer (34-h.p. Riley), of the Coventry Club, had also retired. W. Gunn (10-h.p. Lagonda), of the Motor Cycling Club, retired at the end of fifty miles with defective water circulation; and J. Van Hooydonk (8-h.p. Phoenix), of the same club, after doing seventy-one miles, was put out through a burst tyre. The result was as follows:—Motor Cycling Club, 457½ points, 1; Coventry M.C., 440 points, 2; Birmingham M.C.C., 433½ points, 3.

### PUBLIC MOTOR SERVICES.

*We shall be pleased to receive the published time tables, list of fares, etc., of Public Motor Services for notice in this column.*

THE motor-omnibus service between Clacton and St. Osyth is being well patronised.

KEEN agitation has arisen in Stretford (Lancashire) in connection with the granting of licences to the Manchester District Motor 'Bus Company. It is understood that a suggestion for a maximum speed of eight miles an hour to reduce vibration has been made to the company, together with conditions as to the time of waiting by the buses at the termini.

A CAB DRIVER has obtained damages at the Marylebone County Court against the London Motor-bus Company, one of whose motor-buses had crashed into his cab. The driver of the bus admitted that he had only been driving the automobile a month when the accident occurred, although he had been learning for some time.

THE recently-formed Timaru (New Zealand) Motor 'Bus Company has just purchased two buses from an Auckland firm.

AN accident has occurred on the motor char-a-banc service between Scarborough, Filey and Flamborough, a vehicle running into a bank in trying to avoid another car.

MR. H. E. BLAIN, manager of the West Ham Corporation tramways, notes that that undertaking has begun to face motor-bus competition on one of its most popular routes, and, owing to the inaction of neighbouring authorities, there is a possibility of such opposition securing the patronage of some of those passengers whose through-running journeys make impossible their conveyance the whole way by electric tramcar. A service of motor-buses between Manor Park and Stratford would probably induce both the East Ham and West Ham authorities to come to terms with regard to the horse tram between Green Street—where the Great Eastern motor-buses are garaged—and Manor Park.

THE Manchester District Motor Omnibus Company has applied for licences for four additional motor-buses to be run to Cheadle from Didsbury. The application is being left for a week by the Manchester Watch Committee while they consider a petition presented by residents along the route, in which the following seven-fold indictment of motor-buses appears:—1. Vibration, extending to the houses on the road. 2. Dust, raised in clouds by the cars. 3. An appalling noise. 4. A most obnoxious and persistent smell. 5. Wear and tear of the roads, causing extra cost to the ratepayers. 6. Depreciation of value of residential property. 7. Late hours at which the cars are allowed to run.

THE motor-bus service between Kirkwall and Stromness has received an important addition in the shape of a new motor-bus which arrived at Stromness last week for Mr. Robertson Grant.

OWING to the lack of public support, the Mid-Sussex motor-omnibus service has just been discontinued.

AT Whitfield's Tabernacle, London, a meeting of London motor-bus workers, convened by the Amalgamated Association of Tramway and Vehicle Workers, has been held to consider the advisability of forming a branch of the Amalgamated Association. The Rev. James Holmes

presided, and addresses were given by Mr. Ben Cooper, L.C.C., and Mr. C. Watson, the organising secretary. The latter said the Association of Tramway and Vehicle Workers had funds amounting to £22,000. The men employed in the motor-bus work in London worked under an enormous strain, and it behooved them to take steps to protect themselves and their interests.

OF the numerous excursions to be made by public motor service about Boulogne, quite one of the most popular is that from Wimereux to Wissant, which latter place is within an easy walk of Cape Gris Nez, the nearest point to the English coast, a grand view of which can be obtained on most days.

ON the 23rd ult. Eugene Lucas, motor-bus driver in the employ of Mr. Patrick Hearn, was summoned by Inspector Blaydon for unlawfully driving motor-bus L.C. 7411 at Westminster Bridge on August 1st without having two independent brakes in proper working order. Defendant pleaded that one brake was effective, but Mr. Horace Smith fined him £5 and costs or in default twenty-one days imprisonment.

### MOTOR-CAR ACCIDENTS.

AT an inquest on George Logan, an old man who was killed by a motor-car while carrying a sack across the road at Norbiton, it was stated that the man lost his nerve and stepped back into the car, which was being driven at about eight or ten miles an hour. The jury returned a verdict of "Accidental death," and exonerated the driver from blame.

A HIRED motor-car, containing Dr. Arthur G. Don, and driven by a chauffeur named Stanley Thurger, of Sevenoaks, turned over between Riverhead and Sevenoaks through a sideslip on the muddy road. Dr. Don was pinned beneath the car, and was killed instantaneously. The chauffeur was only slightly injured.

AT the inquest on Saturday on Dr. Don, of Sevenoaks, who was killed on the previous Thursday in consequence of his motor-car coming in contact with a kerb, the chauffeur who drove him said he was seventeen years old, and received 8s. 6d. per week as salary. He had only had a month's training locally before he started to drive. The Coroner commented on the law which permitted a lad of such an age to take out a certificate without regulation or examination. His certificate virtually made him a competent driver, whereas he might have only a crude knowledge of the machine. The jury returned a verdict of "Accidental death," and added a rider recommending an amendment of the law giving control of motors only to experienced and proper persons. They exonerated the chauffeur from blame.

WHILE a party of tourists from Hamilton, Scotland, were motoring down a rough hill near the Cliffs of Moher, West Clare, on Saturday, a strong wind off the sea caught the canopy of one car, causing it to skid into a ditch. After proceeding a short distance the vehicle turned over into a bog, and all the occupants were pinned underneath. No limbs were broken, but the tourists were badly contused and cut.

AMOS LEE, general dealer, of Shoreham, has died at Hove Hospital, as a result of injuries received in a motor-car accident near Brighton. While crossing the road he was knocked down by a car and dragged along the road.

AN inquest was held on Saturday at Hove Dispensary on the body of the Shoreham man Amos Lee, who was killed through having been knocked down by a motor-car at Fishergate, near Brighton. The evidence showed that the body got entangled with the machinery of the car, which had to be lifted bodily to allow of the extrication of the remains. The jury returned a verdict of accidental death.

### CASE DISMISSED.

DOUGLASS MORTON ELLIS, chauffeur to Mr. Cross, Catthorpe Towers, was summoned at the Lutterworth Petty Sessions for recklessly driving a motor-car on the highway at Catthorpe, on the 6th ult. Defendant pleaded not guilty. After hearing the evidence the chairman stated they had come to the conclusion that defendant was not driving recklessly, but that he took the ordinary precautions. They hoped, however, he would take it as a caution against any suggestion of driving recklessly in the future and always sound the horn at corners and bends in the road. The costs were remitted.

### THE STOLEN MOTOR-CAR.

AT Highgate Police Court, on Saturday, George Keighley, manager to Mr. F. Hodge, of Archway Road, Highgate, and The Homestead, Bishop's Avenue, East Finchley, whose motor-car was stolen from a motor-house in Baronmere Road, East Finchley, applied for warrants for the arrest of two men for the alleged theft of the car. In his sworn information he said that the car, which was worth £350, was taken to the village of Hornton, near Banbury, and left there by two men. One, he declared, was William Hodge, and the other was supposed to be his brother, and both answered the descriptions of men who were seen in East Finchley just before the theft. The men, though bearing the same name, were, however, in no way related to Mr. Fred Hodge. Warrants were granted for the arrest of the two men.

# Our "Limerick" Competition.

THE task of adjudication upon the many hundreds of Limericks received in this competition was no light one; nor was the selection of those which appear on this page much less difficult.

After consideration the first prize of one guinea is awarded to Mr. G. S. Davidson, Saughton Mains, Corstorphine, Scotland, for the following:—

A "Coleman" who stokes on a "White"  
Has challenged a "Napier" to fight,  
But the writer has fears  
That the "car without gears"  
Will soon "Edge" away out of sight.

Below we give a selection from the unsuccessful competitors:—

There was an exhausting "exhaust,"  
By which all the petrol was lost.  
To "advance" or "retard"  
Proved equally hard,  
Which the "spark" only found to his cost.  
W. G., London.

Have you heard of a fellow named Rover,  
Who rode in his car to Andover,  
But his speed had to quell  
When in a police trap he fell.  
And his name he was forced to (H)andover.  
S. J. C., Pimlico.

Since the earlier days of the movement,  
Automobiles now show vast improvement;  
If their cost were but less,  
Nearly all must confess,  
They'd command universal approvement.  
L. L., London.

You've all heard of the Vanguard, I know,  
Whose reputation was checked by a blow,  
But they're doing their best,  
Now their name's at the test,  
To keep all their brakes free from woe.  
W. W., Clapham.

There was a young fellow, a Jew,  
Fell in love with a girl dressed in blue;  
A motor he bought her  
But another man sought her,  
And eloped on the car built for two.  
S. C. H., Nottingham.

A maid and a chauffeur named Wyatt  
Went out for a ride on a Fiat,  
Dogs, chickens, they killed,  
Old ladies they spilled.  
Result—in the village a riot.  
K. G., Newport.

There was a young woman, alack,  
Who thought she could drive a Darracq;  
Though she drove without fear,  
She used the wrong gear,  
And now goes about on her back.  
W. R. S., West Kirby.

There once was an irascible colonel,  
Who had purchased a motor infernal,  
By advice of a friend,  
He his troubles did end  
With a sale through the *Motor-Car Journal*.  
R. D. W., High Wycombe.

I guess you've heard of Staplee Firth,  
Often the cause of glee and mirth,  
If he had his way,  
It is quite safe to say,  
He'd clear all "traps" off the earth.  
C. W. (Coventry).

Buyers went to a show in the autumn,  
And the S.M.M. thought they had caught 'em;  
But Cordingley's art,  
Accordingly smart,  
In the spring sought 'em, taught 'em, and caught 'em.  
M. D., Melton Mowbray.

When up at the Court he was fined,  
He pleaded pure absence of mind,  
He'd lit up in front,  
But allowed—with a grunt—  
He'd forgotten to light up behind.  
L. L., London.

There once was a truthful P.C.  
Who timed a small Benz 3-h.p.,  
He swore that its speed  
Did thirty exceed,  
So the owner paid much £ s. d.  
I. B., Kew.

There was a young man with ambition,  
Who paid for some motor tuition.  
The first job he got,  
He was sacked on the spot;  
Well, his language won't bear repetition.  
T. W. B., Bowes Park.

There was a young man of Belfast,  
Whose pace was so frightfully fast,  
That one day at a curve  
His car gave a swerve,  
And now he's a thing of the past.  
R. R., Melton Mowbray.

There once was a policeman named Hector,  
Who failed as a mere crime detector,  
But you got in a hole  
If you passed his "control,"  
So they made him a full-blown inspector.  
W. A. C., London.

A Minerva was running quite well,  
With a doctor, a mighty big swell,  
There came a collision,  
Which altered his vision,  
And what he saw, who can now tell?  
W. R., West Kirby.

You've all heard of a fellow named Byker,  
Who stopped cycling and went in for a Spyker,  
The dust he can bar  
With that wonderful car,  
And his friends are all getting one like her.  
C. B., Stockwell.

There is an old Motor Car Act,  
It's been a great failure; in fact,  
All men are agreed  
That the limit of speed  
Early next year must be "sacked."  
S. L. W., Frome.

"You horses have all had your day!"  
Quoth the motor while speeding away.  
But the engine broke down  
Three miles from a town,  
And the horse trotted past with a "neigh"!  
I. R. C., Shere.

The two prizes of half a guinea each are awarded to Mr. C. Pittar, 21, Wellington Square, Oxford, and to Mr. H. J. Rogers, of Watford, for the following contributions respectively:—

The Commission deserves an ovation  
For that very sly recommendation,  
The terms of which are  
With big plates on each car,  
To smother its heat radiation.  
(N. B.—This grievance requires ventilation.)  
They travelled along at a dence of a pace  
Through a dusty aroma of bliss,  
When a rock struck the wheel  
Of their automobile,  
And then they were just like this.

Fred Edge to Fred Coleman has stated  
That the steam-car is quite out-of-dated,  
But it beat the Napier  
Up hills far and near,  
So Fred Coleman is somewhat elated.  
C. C., Balham.

There was an old motoring colonel,  
Whose car had some trouble infernal.  
To learn what it be,  
It's quite clear, said he,  
I must write to the *Motor-Car Journal*!  
J. E. H., Battersea.

On main roads round London are seen  
Yellow-armleted scouts cute and keen.  
The A.A., you know,  
Strikes a powerful blow  
Against motor-traps unjust and mean.  
G. M. H., Canonbury.

Oh, motoring's jolly good fun,  
As long as the motor will run,  
But the fun is reversed  
When your tyres are all burst,  
With a noise like the crack of a gun.  
F. M., Huddersfield.

There once was a young road hog named Myer,  
Whose car one day caught on fire,  
The 'bus drivers all chaffed,  
The horses, they laughed  
When the only thing left was a tyre.  
M. J., Streatham.

Said a policeman one day, "I'm not in it,  
My stop-watch is exceeding its limit."  
As a motor passed by  
On the watch cast his eye:  
Just imagine—four miles to the minute!  
G. R. P., Armadale.

There was a young chauffeur named White,  
Who very nearly expired through fright;  
Whilst out for a ride,  
A bobby espied  
His car was without a tail light.  
I. J., Streatham.

A novice who purchased a car  
Said, "I'm told this will carry me far,  
If I keep the clutch easy,  
And the working parts greasy."  
So he smeared them all over with tar.  
C. P., Oxford.

He sat at the wheel of his car,  
When another he sighted afar;  
Then his 60 Mercédès  
He let rip like Hades,  
And now he is "crossing the Bar."  
A. E. N., Earley.

A mechanic, who drove a steam roller,  
Didn't seem to know how to control her,  
So a man on a Star  
Cried, "Take home that car,  
Or some bobby will think that you stole her."  
C. P., Oxford.

## CASES AGAINST MOTORISTS.

At the York Police Court, H. Gautkin, Kensington, London, was fined £5 and costs for driving a motor-car at an excessive speed in High and Low Ousegate, York, on August 9th. The evidence of the police and a local magistrate showed that the defendant came round Spurriergate corner at about fifteen miles an hour and failed to heed the constable's warning to "steady up," and all the traffic in the street had to be "held up" for him.

At Chelmsford, William Clarke, motor engineer, of Chelmsford, was summoned for driving a motor-car in a manner dangerous to the public. A coachman said he was driving a dog-cart in the High Street, when a motor-car driven by the defendant came round the corner from New London Road on the wrong side, and ran into the horse's front legs. Defendant refused to give his name and address. The horse's legs were injured, and both the trap and the motor-car were damaged. Defendant, who pleaded guilty, was fined £5 and costs 13s., or a month's imprisonment.

MOTORISTS driving in South London should be careful. Claude White, of 119, Piccadilly, summoned for driving a motor-car in Lewisham High Road at more than twenty miles an hour on July 22nd, was fined £5, with 2s. costs. At Greenwich, Alfred Greenbourn, of 47, Dover Street, Piccadilly, and Stuart Crole Wyatt, of 24, Palace Court, Bayswater, were each fined 40s., with 2s. costs, for similar offences in the same road. Pierre Dorne, of Avenue Road, Regent's Park, was summoned for driving a motor-car in Loampit Vale on July 23rd at more than twenty miles an hour, for allowing the identification plate at the back of the car to be obscured, and for failing to produce his licence. Police-constable Cook, 592R., stated that the car was travelling at the rate of 26 miles 286 yards an hour. There were some spare tyres at the back of the car and these obscured the number. When witness asked defendant to produce his licence he admitted that it was not in his pocket. It was, however, produced next day. Defendant, who is chauffeur to the chief engineer to Sir Weetman Pearson, whose firm is carrying out the L.C.C.'s sewage work in Lewisham, admitted the excessive speed, and said that having exchanged his clothes he forgot to take his licence out of his pocket. He denied that the back plates were obscured by the tyres. He was, however, fined £6 3s. in all, with 6s. costs.

WILLIAM W. GOSSAGE, J.P., of Woolton, near Liverpool, and a volunteer officer, was charged at Lancaster with traversing a measured distance at the rate of twenty-seven miles an hour. The defendant pleaded that his speedometer fixed to the car only indicated twenty miles an hour at the time in question. He was under the impression that there were "traps" about, and he drove carefully, keeping his eye on the indicator. He was fined £7 10s. and costs, a previous conviction at Stockton Heath having been proved. A charge of failing to produce his licence was dismissed on payment of costs.

At Keswick, on Saturday, Captain W. J. Farrer, Bassenthwaite, who the week previous was fined £15 on a charge of recklessly driving his motor-car, gave formal notice of appeal to Quarter Sessions on the grounds that he was not guilty, that the decision of the Bench was against the weight of evidence, and that the fine was excessive.

A MOTOR smash involving injuries to Manchester men was investigated at Rugby, when George Goldring was summoned for driving his employer's car in a manner dangerous to the public. Two Manchester witnesses, named Gledhill and Lees, said that they were riding motor-cycles at Dunchurch on August 5th, and while they were proceeding at about fifteen miles an hour the defendant with his car dashed into them from behind without any warning, smashing their machines and injuring them. The defendant alleged that the cyclists swerved, and said his master had compensated them. He was fined £5 and costs, and his licence was endorsed.

FRANK EDWARD WALKER, Gilmorton, was summoned at the Lutterworth Petty Sessions for using a motor-bicycle without having it registered in accordance with the Motor Car Act, 1903, on July 30th. He was also summoned for driving the bicycle without being duly licensed, at the same time and place. Defendant admitted the offences, but pleaded ignorance. Mr. G. Rowlatt (deputy clerk to the County Council) prosecuted on behalf of the County Council Committee, and in setting out the facts stated defendant not only rode a bicycle unlicensed, but he had on the machine a number which had no right to be on, thus leading the public to believe it was registered. It was still more serious for a person who might be registered under that particular number. The number on the bicycle was A.Y., D.U., 47. This, he believed, was the registered mark for Coventry. He was informed by the police that defendant's brother, Eli Walker, had a motor-bicycle with the same number on, and on the day the charge was laid the brother was seen with the same number on his bicycle. Consequently both bicycles carried the same number. Defendant had been registered to drive, but the licence expired on the 13th July. To assist all licensees, a month's notice was given them that the licence would require renewal on a certain date, and this was sent to defendant on July 1. He understood that defendant changed his residence in July from Lutterworth to Gilmorton, but still he would receive the notice. Defendant expressed regret, and said he was under the impression that as he and his brother were makers only one number was required. As to his licence to drive, he did not know it had expired, and certainly had not seen the notice. He hoped the Bench would take a lenient view of the case. By Mr. Rowlatt: Cycle makers had a red number, but each machine had to bear a bear a consecutive number. The chairman stated the Bench had

decided to take a lenient view of the case, and defendant would be fined 5s. and 10s. costs on each charge.

## WARNING OF APPROACH.

SHERIFF-SUBSTITUTE MITCHELL has heard evidence in Stirling Sheriff Court in a complaint at the instance of the Procurator-Fiscal of Stirlingshire against William G. Christie, West Point, Saltcoats, for contravening the Motor Car Act by failing to give audible and sufficient warning of the approach of his motor-car at the junction of the Campsie and Torrance roads, near Lennoxtown, this being a place where it was necessary this should be done on account of there being a sharp turn in the road and a high bank and hedges, which prevented him seeing what was coming in the opposite direction. The result of the alleged neglect was that James Gillik, who was cycling down the hill in company with two other wheelmen, was thrown on to the top of the car and rendered unconscious. The accused pleaded not guilty. All the witnesses for the prosecution said that they heard no horn sounded or any noise made by the car before the collision occurred. Mr. Macaulay Smith submitted that his client was not required by the terms of the statute either to ring a bell or sound a horn, but that the cut-off of the exhaust, which made a continuous noise like that of a Maxim gun, was an instrument according to the terms of the section "capable of giving audible and sufficient warning." He also argued that as the County Council had failed to erect danger signposts at this place his client could not be blamed for being ignorant of the fact that this was a dangerous point. A fine of three guineas was imposed.

## OBSTRUCTING A MOTORIST.

At Canterbury, the driver of a cart, named Arthur Amos, has been prosecuted by the Motor Union for wilful obstruction. It was stated that Amos would not allow Mr. Arthur J. Wilson, of London, who was motoring from Canterbury to Herne Bay, to pass him for a distance of half a mile, and that when his name was demanded he threatened Mr. Wilson with the butt-end of his whip. He was fined £3 9s., including costs, or a month's hard labour in default of payment.

## POLICE TRAPS.

THERE is a measured furlong in the Kingston road, Ashford. P.S. WAGHORN, in a case at the Battle Petty Sessions, has been describing a trap at Lunsford Cross, in the parish of Nunfield, as being on the decline and of a winding nature.

ON the Lowestoft road, between Brockdish and Scole, immediately round the corner at Scole Post Office, the police have made a four-mile measured test for motor-cars. It is worked both ways by telegraph from the post offices.

PLAIN clothes constables are working a trap between the seventh and ninth milestones from Ipswich on the road to Colchester.

THERE is a measured distance in the Brompton Road, S.W., over which motorists are timed by the police. In working this variations between the two watches of the police have been noticed, in which cases the police have assured the magistrate at the Westminster Police Court the driver is given the benefit of the doubt.

ON the main road between Lancing and Shoreham there is a measured quarter of a mile. Several motorists have lately been trapped therein. A correspondent suggests that the scouts of the Automobile Association might usefully be put on that road.

A POLICE trap in the Station Road, Arundel, has been much used of late for the discovery of speedy motorists.

THE trap at Chiddingfold has resulted in several motorists being summoned to the Hailsham Petty Sessions.

BETWEEN Walton and Preston Brook, Cheshire, are motor danger spots.

SEVERAL motorists have been trapped on a measured quarter of a mile on the Coventry road, Sheldon. The Warwick road, Olton, is another danger spot.

AT Burnham, on the Bath road, is a measured quarter of a mile where motorists should travel warily.

THERE is a carefully watched police trap on the Chester road, near Birmingham. It occurs near the cross roads at Hardwich.

THE Lewisham High Road has become a danger spot for motorists, and even in Catford there is need of caution.

IN the Bolton Road, Lancaster, is a measured quarter of a mile. Between the signalling and the timing officers are some trees, and the signal between one and the other is the waving of a handkerchief.

## TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notices will be taken of anonymous communications.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

# THE Motor-Car Journal.

VOL. VIII.]

LONDON, SATURDAY, SEPTEMBER 8, 1906.

[No. 392.]

Published Weekly by CORDINGLEY & CO., 27-33, Charing Cross Road, London, W.C.

## M.C.J. PRIZE COMPETITIONS.

### FOR MOTORING EXPERIENCES.

THE proprietors of the *M.C.J.* offer three prizes—one of a guinea and two of half-a-guinea each—for the most humorous motoring experience, limited to 100 words, and to be written on a postcard. It must be concisely worded, and should be a record of something that has actually happened. The last day for receiving competitions will be Saturday, September 15th. All entries must be sent to the *M.C.J.* Office, 27-33, Charing Cross Road, W.C., and the Editor's decision will be final. A selection of the unsuccessful experiences will be given in the same issue as that in which the awards are announced.

### AUTOMOBILE PHOTOGRAPHS.

Three prizes are also offered—one of a guinea and two of half a guinea—for the best photograph in which a motor-car figures. In making the award regard will be paid to the public interest of the picture, as well as to its artistic merits; hence, photographs of cars outside historic buildings or monuments will be as welcome as those of vehicles in pleasant places.

Only original photographs may be submitted, the copyright of which belongs to the competitor. The winning photographs will be published in the *M.C.J.*, and the Editor reserves the right to reproduce, without payment, a selection of those not successful in the competition. The latest date for receiving photographs will be Saturday, the 29th inst. Envelopes must be marked "Competition" in the top left-hand corner.

## COMMENTS.

L N

As anticipated in a recent issue of the *M.C.J.*, an Order has now been issued by the Local Government Board assigning a new index mark to motor-cars to be registered in future by the London County Council. By the Motor-car (Registration and Licensing) Order, 1903, the letter A was ordered to be affixed to all cars registered in London, and when the numbers came close to 10,000, it was necessary to assign a different mark. L C was chosen by the L.C.C., and a fresh Order issued by the Local Government Board on April 17th, 1905. Now that the numbers are approaching 10,000 the Board has adopted the suggestion of L N as the index mark for all vehicles registered after the first 20,000.

### Consideration on the Road.

ABOUT a third of a mile beyond the twenty-sixth milestone on the Epsom to Guildford road there is situated, on the right hand side, a children's hospital, to the presence of which our attention has been called by Mr. Wilson Noble, of Tangley Park, Guildford. As long as possible many of the children live and sleep on a verandah but a few yards from the road, and at this time of year the little ones must suffer terribly from dust unless motorists are careful to go past the hospital very slowly. It is only necessary to call attention to this for

motorists to crawl by at a moderate pace; for, unfortunately, the house cannot easily be seen until one is upon it, owing to a bend in the road. There will, however, be no difficulty in recognising the locality if its distance from the twenty-sixth milestone is remembered, and also that it is at the summit of a slight hill and just beyond four cross roads; a sign post shows that the right hand road leads to East Clandon. Coming the other way—i.e., from Guildford—the hospital can be seen from a greater distance, and can easily be recognised by its red roof and upper storey, its yellow rough cast on the first floor and red ground floor. Anyone slowing down and giving a passing greeting to the children will be well repaid when he sees the hearty way in which they respond to it.

### The Skegness Meet.

THE Nottinghamshire Automobile Club is responsible for a very interesting gathering of motorists on the coast of Lincolnshire to-day (Saturday), and after a preliminary appearance competition, when good looks rather than qualities of speed will secure recognition, the townspeople will settle down to an afternoon of fine sport. If the weather and conditions are at all favourable an attempt will be made to lower the sand track record made at Saltburn this year. Skegness is on a portion of the coast that has been suffering from the erosion of the sea for many a year. In Danish the name means the promontory of Skaeggi, and the town was of considerable importance in the old days. Leland, writing in 1540, observed, "Went to Skegnesse, sumetyme a great haven towne, a four or five miles from Wilegripe (now almost devoured by the sea). Mr. Paynelle said unto me that there was once a haven and a towne walled and having a castle. The old towne is clene consumed and eaten up with the sea. Part of a church of it stood a late. For old Skegnesse it now builded a pore new thing." Along the coast from Skegness to Grimsby traces of a forest are still to be seen, notably at Friskney, Wainfleet and in the East Fen.

### Dust Experiments.

THOSE who have followed the Road Reports which have appeared in our columns during the last few weeks cannot fail to have recognised the thoroughness with which the local authorities in various parts of the country are endeavouring to deal with the dust that is raised by motor-cars in the only real way, viz., its prevention. At Beckenham, Mr. J. A. Angell, the surveyor to the District Council, has spent much time and money on the work, and his report to the Council deserves the attention of surveyors in other districts as well as councillors anxious to incite their officers to useful and effective work in this direction. He says the tar painting on the main roads was commenced in May, and that so far as can be seen the results are to a great extent satisfactory. Too much, however, should not be expected, for although the formation of mud or dust by the working up of the binding material has been much diminished, to a large extent the abatement of the dust nuisance must, as heretofore, be largely a question of scavenging. In the case of the ordinary macadam or flint roads, scavenging, dry or wet, is practically incessant,

the binding material, and consequently the roadway itself, being carted away in the form of mud or dust. Herein lies the advantage of tarmac and tar-painted roads over ordinary macadam, as the loose binding material either does not exist or its disintegration is prevented. Owing, however, to the smooth surface of the tar macadam or tar-painted roads, the comparatively little dust deposited on the surface is very readily diffused by the wind or passing carts, with the result that unless such roads are daily scavenged the nuisance arising from the diminished, but more readily distributed, dust constitutes an evil to be combatted only by constant scavenging with occasional watering. The watering of tar macadam or tar-painted roads, however, is far more effective than on macadam, the absorption being lessened and each application remaining effective for a longer period than on untarred roads. The Council are spending £1,900 in laying down two short lengths of road with the most up-to-date tar macadam. In dry weather motor-cars raise a slight haze when passing over the tar-coated roads, but on others they disappear in a cloud of dust.

#### Trouble among Cyclists.

◆ ◆ ◆  
THERE is trouble in the ranks of cyclists owing to an endeavour now in progress to alter the basis of the organisation of the Cyclists' Touring Club. It is proposed that this shall be extended to embrace all tourists, whether they motor, cycle or walk. Against this a committee

Mr. E. J. Mitchell, of the Palmer Tyre Company, off for a tour on his 9-h.p. Singer Tri-car.

has been formed which is now collecting the funds for a great defence, so that the original idea of the Cyclists' Touring Club may be preserved. In these transition days the organisation that is not prepared to adapt itself to the needs of the time may be classed among the moribund institutions of the country. For the C.T.C. to hand its signs and warning posts over to the local authorities and allow them to neglect their care and maintenance, so that they are now mostly rusty relics of a most enterprising day, was not wise. At the same time all must recognise that it is now too late to revive the interest in that department of the Club's work, and that, as we have frequently suggested of late, the task of setting up warning notices and the like must devolve upon the associations representing the swifter and expanding movement of automobilism.

#### Road Guidance.

◆ ◆ ◆  
In some parts of the country the county clubs have already done useful service in looking after the roads, inciting the authorities to do their duty, and in other ways assisting motorists generally. But the subject is too important to be made the care of local organisations, and we look forward to the Automobile Association, which has already done such

useful service on the roads, to continue its good work by the provision of signs and finger-posts, such as are familiar in France. It might make a start in some district where the co-operation of the local authorities could be obtained, and thus pave the way for a really comprehensive scheme of road guidance throughout the country. In any case, it can easily demonstrate to the Cyclists' Touring Club that the work of that organisation on the road is over, and that a newer and more active spirit is now in operation on the great highways of the land.

#### Good Work in Middlesex.

◆ ◆ ◆  
At the same time it must be recognised that some of the county authorities are doing good service in the way of denoting dangerous corners, cross roads, precipitous places, and the like, the Middlesex County Council alone having spent £1,662 on such necessary work during the last financial half-year. During the same period its receipts from fees under the Motor Car Act totalled £3,946, so that there was a clear gain to the county. Even there, however, where the Council is evidently solicitous for the safety of the people within its area, there will probably be found scope for suggestions from the Automobile Association as to suitable locations for an extension of the work.

#### Danger Signals.

◆ ◆ ◆  
In connection with this question of danger warnings mention may be made of what the East Surrey A.C. has been doing in its area. By Section 10 of the Motor Car Act, 1903, it is provided that Town Councils and other local authorities shall within their areas set up sign-posts denoting dangerous corners, precipitous places, and cross roads, where such sign-posts appear to them to be necessary. The attention of the Reigate Town Council was drawn to the necessity of danger signals at various points in the borough, particularly at Buckland Corner, by Reigate Heath, but the Council declined to undertake their erection. Thereupon a local resident made an offer (through the East Surrey Automobile Club) to pay the cost of putting up the required signals at Buckland Corner, provided that the Council obtained the necessary permission and maintained them. To this offer the Council has replied giving permission to the Club to erect two danger signals under certain conditions, one being that the Club shall undertake their future maintenance. There is not one danger signal in the borough, although there are several dangerous corners, precipitous places, and cross roads, and yet the Council declines to perform its statutory duty.

#### Regulations with regard to Signs.

◆ ◆ ◆  
As showing how keenly alive to the growing public demand for the provision of warning signs are some of the local authorities, we may instance the case of a Metropolitan borough on the outskirts of London, whose surveyor rang us up on the telephone to inquire as to the requirements of the Act with regard to road signals. The officials apparently had a vague kind of idea that there was a certain amount of latitude allowed in the erection of such signs. This is scarcely the case, the regulations being particularly explicit on the point. These have to be fixed about 50 yards from the spot to which they apply, and the underside of the sign is to be not less than 8 ft. from the level of the ground. Other directions with regard to the circular, triangle, and diamond-shaped boards are generally known to the public as well as to motorists.

#### Love and a Garage.

◆ ◆ ◆  
ROMANTIC associations lurk about the Waterloo Motor Garage in Chicheley Street, York Road, Lambeth, which has come into the possession of the Hon. Henry L. Bruce, whose engagement to Miss Camille Clifford has given a piquancy to the morning's news in a season that seemed duller than usual. Mr. Bruce has high aims for his business, and,

with Mr. Colin Defries as a practical manager, hopes to become an important factor in the motor business of the Metropolis. There are now quite a number of members of the aristocracy in the motor-car industry of London, but Mr. Bruce's entry into that department of commerce has had unique associations. A large connection for repair work among members of the theatrical profession is already assured him. Personally he has great faith in his 40-h.p. De Dietrich car, upon which he has travelled 8,000 miles within the last eight months, driving and looking after it himself all the time.

#### The Blackpool Meet.

ALTHOUGH the General Purposes Committee of the Blackpool Town Council decided against the proposed motor-car meet at Blackpool, the full Council at their meeting on Tuesday approved of the scheme, and the Blackpool and Fylde Automobile Club will now go forward with their arrangements, reference to which was made in our last issue. The Town Clerk has expressed the opinion that the Corporation had no legal power to close the Promenade for such a purpose, but those favourable to the proposal pointed out that the meeting

#### Slough.

ONE of the most popular roads from London is the Great Bath Road, upon which hundreds of motorists travel every week. It runs through the centre of the town of Slough, which is now becoming an important residential suburb of London. The subject of motor traffic in the town is referred to in the current number of the "Parish Magazine," in which the Rector of Slough says:—"It is sad to think that our High Street, of which we are all so proud, should of late become such a source of danger to all, whether on pleasure or on business bent, through the enormous increase of the motor traffic. Of late no less than three deaths in close proximity to our town have been occasioned through the motors, together with several accidents in the High Street, and in some cases attended with serious injury. Of course many motors are driven at a reasonable pace, but there are many others driven through our town at such a pace as to make one wonder whether there is any regard for the life of man or beast." The rector issues a warning to parents to caution their children against playing in the streets, and adds, "Our police, in the face of countless other duties, and the various automobilists' scouts, have indeed a difficult task to perform,

Motor-buses in the Isle of Wight. The inauguration of the new circular route via Shanklin.

would bring a good class of people to the town, and help to prolong the season. These considerations had weight with the Council, and the meet will take place in the second week in October.

#### The Motor-Van Trials.

THE heat engendered between the A.C.G.B.I. and the M.V.W. and O.U.A.—initials that will be quickly comprehended by regular readers—has not declined in temperature in consequence of Mr. J. W. Orde's reply to Colonel Crompton. It illustrates how the endeavour of the Piccadilly Club to completely control the industry is being resented by an important section of the trade, as well as by users of motor vehicles, and how aggrieved is the parent body at the non-submissiveness of the minor organisation fostered under its wing. There are signs, however, that the movement is becoming too general to be restricted to the narrow legislation of a body in which the social element predominates, and that each aspect of Motorism will desire to advance along its own lines, while still willing to work together where the interests have something in common.

and if in the future the speed limit is not to be reckoned with, they will find it more than ever a problem how to protect the lives of people in town and country."

#### The Rise in the Price of Petrol.

THE increase in the price of petrol will be considered by the General Committee of the Motor Union at their meeting at Scarborough, and the organisation will be asked to appoint a Special Committee to inquire what steps can be taken to protect the interests of the private consumer. This subject will doubtless give added interest to the meeting on the 22nd inst., which will be made notable by the invitation of the Earl and Countess of Lonsborough to a garden party at Lonsborough Lodge, Scarborough. Not only will there be a great attendance of motorists from all parts of Yorkshire, but appearances point to the probability of the last provincial meet of the season being not the least important of the year.

MESSRS. ASTER, LTD., having fitted up a special repair shop at their new works at Wembley, are now prepared to execute repairs to motor-cars and petrol engines of all kinds.

## MOTOR SERVICES IN IRELAND.

A FEW years ago those who have watched with sympathetic eye the development of Ireland hoped much from the much-belauded scheme of motor transit associated with the name Iveagh-Pirrie. In some quarters the shortness of vision possessed by local authorities prevented anything like adequate opportunity being vouchsafed to the scheme; the refusal of others to make clear the roads whereon the motor vehicles were to travel, and the supineness of many public men from whom co-operation had been expected, combined to prevent the fulfilment of high hopes.

But while this organised development has been frustrated, there are local services for passengers being established in various parts of Ireland which should do something to add to the delights of travel in the island to which Nature has been pleasant. Here, for example, is an illustration of the modern

opportunities of visiting the Dargle, the Scalp, and other places of popular resort.

The motor char-à-banc seems as though it would rapidly become acclimatised in Ireland, for not only in Wicklow, but, as we pictured on the 12th July, it has become a feature of tourist travel in the north of Ireland. In utilising this particular form of automobile the promoters of the Irish services have escaped the feeling of dubiety with which the suitability of the double-decked motor-bus is regarded in many quarters as a vehicle for the conveyance of pleasure parties in hill country districts.

Now that there is hope of really useful services for the convenience of the public becoming a permanent feature of travel in the Emerald Isle, we would renew the suggestion made some months ago that the county and local authorities should, without delay, put their roads in order. There is no question of the motor vehicle being merely a transient hobby; it is now an accepted factor in the traffic problems, and the Irish authorities may therefore, with every confidence, set about the improvement

The Albion 16-h.p. Twelve-seated Char-a-banc in Service at Bray.

- idea in carrying passengers between Kingstown and Bray. The body of the char-à-banc was built in London by the Lacre Company; the 16-h.p. chassis is by the Albion Company, and the tyres are of the Sirdar type. This vehicle runs between the pleasant Dublin resorts of Kingstown and Bray—the latter a charming place nestling under the great hills of Wicklow and looking out upon the ocean from one of the neatest promenades to be found in all the Emerald Isle. The road between these two places is most delightful, and visitors to Ireland should assist local enterprise while ministering to their own enjoyment by ignoring, for the journey between Kingstown and Bray, the old jaunting car of the Dublin jarvey, and make their way in an up-to-date motor-car. Last year the vehicle ran throughout the season with never a breakdown, the average daily run being more than 100 miles and the consumption of petrol being 13½ miles to the gallon. For the present season, which commenced in July last, another char-à-banc was ordered, and the Kingstown and Bray service has been extended to Enniskerry, allowing

of their roads with a view to the popularisation of hitherto inaccessible resorts with the tourist and traveller. For, just as the privately-owned motor-car has extended the circle of social friendships, so the public service vehicle is capable of increasing the delights of visitors, with consequent benefits to the localities they patronise.

MR. L. L. WHITMAN and C. S. Carris, whose start from San Francisco on a trans-continental trip in a Franklin 30-h.p. six-cylinder car was mentioned in our last issue, reached New York late on the 17th ult., they having made the journey in 15 days 2 hours 12 min.

THERE are some speedy cars in the Motor House in Euston Road, N.W., just now, including a 110-h.p. Star which has been engaged in Continental races, a 90-h.p. of the same type, and a 90-h.p. Darracq. Calling there on Monday we also saw two motor-buses, which, having done good service between Warrenpoint and Rostrevor, are now ready for work elsewhere.

## UNDER THE BRECON BEACONS AND THROUGH MID-WALES.

BY JOHN LL. WARDEN-PAGE.

FOR a person possessed of a fairly powerful car there can be few trips more pleasant than that across Wales—say from Hereford to Aberystwyth. The roads are good; the gradients reasonable; the scenery some of the finest in the kingdom. And we get this scenery from the very start. What can be more beautiful than the road leading from Hereford to Hay with its wooded vales and background of long level upland—the Black Mountains? Of Hereford itself we have no space to write much, but it is an interesting old city, and a pause of an hour or two may well be made to view the cathedral with its sculptured Norman columns and the college of Vicars-Choral hard by, while there are pleasant gardens by the river.

Passing out of the city we notice at about a mile's distance a tall wayside cross, a memorial of the Black Death, a fearful plague which devastated the country in the fourteenth century. But this is the only gloomy note. Presently the road drops to the Wye, our companion, more or less, for many miles.

Picturesque half-timbered cottages appear and disappear, but villages are few. One of the prettiest, I think, is Winterton. But it is approached round some sharp curves; and it was here that the recent sensational motor accident occurred. A chauffeur named Hood, driving his employer's car from Brecon to Manchester, and on the wrong side of the road, rushed into the car of the Duke of Connaught, bound from Monmouth to Rhayader. The results to both cars were dire, and neither could continue its journey. Fortunately his Royal Highness nor any of his suite were injured, and even the offending chauffeur escaped scot-free.

In an hour we reach Whitney Bridge, and the Brecon Beacons come into view closing the valley to the right. Crossing the Wye we enter the village of Clifford, and halt a moment to look at the ruins of an old castle of the Marches, once the home of Fair Rosamund. Of Clifford Castle there is little left, but the situation on a lofty knoll overlooking the Wye is very fine. Everyone, I suppose, knows the story of poor "Rosa mundi non Rosamunda." How King Henry II. loved her; how his Queen (who, by the way, was none too virtuous herself) did not; and how one day her jealous Majesty tracked Rosamund to her bower with a dagger in one hand and a cup of poison in the other and told her to choose. It is said that the frail fair preferred the cup to the cold steel.

Just beyond Clifford comes Hay. Hay is a border town, sleeping below the ruins of another Marches castle. This is better preserved than that at Clifford, and has a fine gateway. Attached to it, evidently built out of the ruins, is a picturesque house of the sixteenth or seventeenth century, with many gates and clustering chimneys. At Hay we enter Wales, and the omens are good, for a fine road stretches away westward,

running parallel with the Wye. We glide easily through the wooded village of Glasbury, with the steep cliffs of the Black Mountains towering over the tree tops on the left, and presently reach that ancient roadside hostelry The Three Cocks, a famous house in the old coaching days and not without repute still. Here for awhile we leave the Wye and follow this good Brecon road for another two miles to Bronllys, where we turn sharp to the left in the village street and descend a steep hill to the little town of Talgarth. Talgarth, which lies almost at the feet of the Black Mountains, is on the route to Llangorse lake, which we take *en route* for Brecon town. The road, though narrow, is fairly good. But beware of thorns! At the end of April we found this road and many other bye-ways strewn with these unconsidered trifles of the hedges. And we cursed them by our gods!

The lake—in Welsh, Llyn Safaddau—comes into sight from the summit of an ascent some three miles from Talgarth. It lies in a pleasant pastureland, with the Beacons rising majestically across the water. To those motorists who delight in the gentle craft I may add that Llyn Safaddau is a favourite among fishermen. There is even a little house by the water where four men may put up and have boats for the pursuit of the fish.

These consist of pike, perch, roach, eels, and a few trout.

Another narrow road strikes westward from Llangorse village to Brecon. Here are more hedge trimmings, and we are glad at the end of a perilous half-hour to emerge upon the wide highway coming up from Abergavenny, where we can enjoy without *arrière pensée* the view of the wooded Usk Valley. Brecon itself is a fine old town nearly 500 feet above sea-level, right opposite the Beacons. Its principal feature, apart from the grand mountain view, is the Priory church, which dates from the twelfth century. It

crowns a wooded knoll above the glen of the Honddu at the far end of the town. The Early English choir is very beautiful; there is a curious old font and many interesting monuments. Just below, in the grounds of the Castle Hotel, are the remains of the Roman castle built by Bernard de Newmarch. Another fragment on the banks of the Usk at the end of the shady Captain's Walk represents all that is left of the town walls.

From a height of nearly 3,000 feet the Beacons look down upon the town. They are well worth climbing, for the view is magnificent, extending from the Bristol Channel to Cader Idris—though I cannot say that I was able to identify the latter among the sea of hill tops to the northward. But they are a good way from Brecon—over five miles as the crow flies, and a bit more as man walks. The motorist, however, may reduce his climb by one half by driving to the Storey Arms Inn, eight miles out on the Merthyr road, with a gradual rise of a thousand feet. I, myself, made the ascent from Torpantau station, a long, easy enough walk, followed by a short, severe climb, so cannot speak of the northern ascent from personal experience.

Geologically the Beacons are of the old red sandstone, the loftiest summits of this formation in Great Britain. The colour-

The Bridge at Rhayader.

[Wallace-Jones, Rhayader.

ing is, of course, very rich, and the northern precipices glow with a ruddy light as we leave Brecon and again take the Hay road Wye-wards. A long hill winds up by the glen of the Honddu, and as we rise the mountains emerge above the tree tops, a sight for gods and men. Indeed, we are tempted to look back frequently, for the views over the Usk Valley are delightful. It is not till we approach Pontybat, six miles from Brecon, that the Beacons vanish for the last time. Here we are called upon to decide whether we shall take the short cut up the lane to the left, dropping into the Wye Valley at Llyswn Village, or continue along the high road to Three Cocks, where the road to Builth leaves that to Brecon. This short cut saves three miles and is good enough for a bicycle (though there are some steep hills), but I do not recommend it for a car. It is neither so wide, so well graded, nor so well kept as the highway. Wherefore we return to within a gunshot of the old inn, and there, swinging sharp to the north, enter upon the splendid run by the Wye side. We do not leave it again until its head-waters are reached beneath the bare slopes of Plynlimmon.

At first the valley is of fair width, a green fertile strath shut in by wooded hills. On the left, where these hills rise steep against the sky, and about two miles beyond Llyswn, is Llanerchcoedlan Waterfall, reached by a path through the woods. Then comes the pretty village of Erwood, where the valley narrows, and the Wye in noisier flood sweeps past the bald hill

its name from its situation—Rhaiadr Gwy, the Falls of Wye. The falls, however, are unimportant, except when the river is in flood, when the water roars over the rocky ledges by the bridge in fine form. The town has been very much to the fore lately owing to the opening of the great Elan reservoirs (the water supply of Birmingham) by the King. These reservoirs lie among the mountains, five miles from Rhayader. We have never been up to them; it is a hard climb, but we believe the road is fairly good.

(To be concluded.)

## USEFUL NOTES.

A RUBBER connecting pipe may be repaired, if leaking or burst, with a tyre patch well bound with tape.

A RUBBER MAT exposed to drippings of oil may have its life considerably prolonged by a few coats of slate-coloured paint. The paint will not be conspicuous, and will protect the rubber from the action of the oil.

SYSTEMATIC periodical inspection and tests of the brakes should be a principal point in the routine of every driver. The joints of the operating mechanism should be seen to be intact, and the brakes should be applied and an examination made that none of the parts of the operating mechanism is limited in its

The Birmingham Water Works Reservoirs in the Elan Valley, Rhayader.

of Garth. Between Erwood and Abernant the scenery becomes even lovelier, and there is a magnificent view down stream closed by Lord Hereford's Knob, a summit of the Black Mountains. Across the river, where the little Edw comes down a wooded gorge, the hills descend in rock terraces. These are due to the action of the sea (!), and even now one can detect the scoring of the glaciers which in some primeval age ground along the cliffs. Close to Aberedw village is a cave, said to have been a refuge of Llewellyn when surprised by the English at Aberedw Castle, of which only a bit of wall remains. In the end, the men of Builth shut their gates against him, and he was killed near the Yrfon brook, which joins the Wye about four miles up the valley; wherefore the place is called Cefn-y-Bedd-Llewellyn unto this day.

Builth, a combination of ancient country town and modern spa—and the two blend ill—lies where the valley opens into a sort of amphitheatre. Its waters are said to be very nasty, but of them we have no personal experience. Neither have we sampled those of Llandrindod, which may be easily reached from Builth. We prefer to cross the Wye and keep up the eastern bank to the large village of Newbridge. Now the hills close in and become loftier, with frequent screes and outcrops of rock. Between them the road winds onward, sometimes high above the river, to Rhayader, a pleasant little town which takes

motion, except by the abutment of the braking surfaces against each other.

THE thumb-screws on the security bolts of a tyre sometimes work loose in the most persistent manner. Ordinarily a rubber washer is placed next the rim, then a metal washer, the thumb-screw following. The squeezing of the rubber washer is usually sufficient to act as a spring and a vibration destroyer. If, however, it does not answer, a light steel spring washer fitted between the ordinary washer and the thumb-screw should effectually hold everything tight.

To grind in a valve is an operation that requires care and skill. The accepted practice among experienced drivers and repairers is as follows:—Place on the valve a small quantity of very fine emery powder, such as Davies'. Use sufficient oil to make a thin paste, being very careful not to allow any of the paste to run into the cylinder. The valve should then be rotated and firmly pressed against its seat at the same time. A screw-driver inserted in the slot in the valve head is easy to use, or a brace and bit is even more convenient. When the grinding is completed wipe every particle of paste and grit out carefully. It is a good plan to stuff a piece of waste into the parts to prevent any grit from entering the cylinders, as a little of the emery will go a long way in scoring the cylinder walls.

## THE S.C.A.R. CAR.

WE briefly alluded in our last issue to the new French-built car known as the S.C.A.R., which is being introduced into this country by the Central Motor Car Company, Ltd., of Long Acre, London, W.C. The vehicle is the product of La Societe de Constructions de Automobiles de Rheims (Rayet, Lienart and Co.), a new concern, which has recently established works at Witry-les-Rheims, and appears to be of sound construction. Generally speaking, the design follows the lines of the modern live axle car; the frame is of pressed steel construction, narrowed in front to increase the lock of the steering wheels, and supported on the axles through five long springs. The engine, which is of the high-speed type, the normal being 1,400 revs. per minute, is rated at 18-20-h.p. The cylinders, which are separately cast, are 90 mm. bore by 100 mm. stroke. The valves are mechanically actuated off separate cam shafts, the inlets being provided with a variable lift obtained by means of wedges sliding between the cams and the valve push rods, and controlled by a lever working on a fixed sector above the steering wheel. An automatic governor acting directly on the carburettor is also provided, the action of which can be cut out as desired by means of the accelerator pedal. The ignition is by means of a gear-driven high-tension magneto, while the water circulation is on the thermo-syphon principle, no pump being employed. The radiator is of the frame ribbed tube type, a current of air being drawn through the same by means of a fan, which is not belt-driven as usual, but is operated off the crankshaft through bevel gearing. The lubrication of the motor is maintained by means of a small positive pump driven off the rear end of the inlet valve cam shaft.

The clutch is of the leather-faced cone type. The operating spring does not surround the clutch shaft, but is located to one side in such a position that its tension can be readily adjusted. From the clutch the power is transmitted by a short jointed shaft to the gear-box, and thence by a cardan shaft and bevel gear to the rear live axle. Three speeds and a reverse, with direct drive on the top speed, are controlled by a single lever. The cardan shaft is enclosed in a sleeve, which takes the place of the usual torsion rod, and which is supported towards its forward end by a stirrup, so that, should anything go wrong with the cardan joints or the shaft itself, the latter would not fall on the ground with consequent risk of doing much damage. The usual foot and hand-operated brakes are provided, these

being of the internal-expanding metal-to-metal type. The car has a wheel base of 8 ft. 10½ in., so that roomy side-entrance bodies can be fitted to the chassis. The vehicle, on which we had a short trial run a few days ago, is the first turned out from the S.C.A.R. works, and, although some of the details are not so complete as is intended, it appears to run steadily, and on open roads develops a good turn of speed.

## EASTERN ECHOES.

AN A.C.G.B.I. examination will be held at the White Hart Hotel, Chelmsford, on the 22nd inst.

WITH reference to the run to Clacton of the Essex Motor Club, mentioned last week, the following members made non-stop runs and kept to the scheduled time, viz., Messrs. Cozens

Mr. J. S. Bennett, manager of the Anglo-American Motor Car Company, at the wheel of a 9-10-h.p. Cadillac Car. At his side is Mr. W. E. Metzger, manager of the Cadillac Motor Car Company in America, who is at present paying a business visit to Europe.

(Lagonda tri-car); A. J. Macdonald (Twin Vindec); Stanley Webb (Quadrant); F. Applebee (Rex tri-car); and J. W. Applebee (Rex with fore-car).

THE other day there was seen at Messrs. J. W. Brooke and Company's Marine Headquarters at Oulton Broad almost every type of motor-boat built by them, including 4-h.p. single-cylinder, 8-h.p. two-cylinder, 12-h.p. three-cylinder, 18-h.p. four-cylinder, 45-h.p. four-cylinder, and 300-h.p. six-cylinder engines, the latter being fitted to "Brooke I." One of the firm's stock designs, "Brooke Cruisers," has just been shipped out to the Argentine Republic for use on the River Plate.

THE Essex County Automobile Club's run to Frinton-on-Sea on Saturday was very pleasant. They met at the Grand Hotel, where the members and their friends were the guests to luncheon of Mr. and Mrs. E. A. Serre, nearly sixty accepting the invitation. After lunch the cars proceeded to Clacton, where they were entertained to tea at the Grand Hotel by Mrs. Knight, whose husband is a member of the club. A most enjoyable day was spent, and many thanks are due to Mr. and Mrs. E. A. Serre and Mrs. Knight for their kindness on the pleasant and notable occasion.

MOTORISTS have certainly visited Clacton and the Grand Hotel in increased numbers this season, and the town does all it can to gain their patronage. At this Hotel a motor garage has been erected to hold eight cars, each having a separate lock-up. The roads of the district are very good for motoring, and a large number of cars do the run from London to Clacton and back again the same day. A special sitting-room is reserved for members of the A.C.G.B.I. at the Grand Hotel, and there is an experienced engineer on the staff to carry out repairs.

## SOME CURRENT TOPICS.

### The Argyll Motor Ambulance.

During a recent visit to the extensive works of the Argyll Company at Alexandria, N.B., we were much interested in a special motor ambulance wagon which was in course of construction for the St. Andrew's Ambulance Association. We are now able to give an illustration of the vehicle, which is fitted with an Aster 26-30-h.p. four-cylinder motor, having a bore of 105 mm. and a stroke of 140 mm. Two systems of ignition are fitted, both high tension, one from accumulators and the other by a magneto. The gear-box is adapted to give three forward speeds and a reverse. The transmission is by a cardan shaft and worm gear in place of the usual bevel form, to a specially-designed live axle. In view of the work the vehicle will be called upon to perform, considerable attention has been paid to the design of the springs, the rear pair being of an exceptionally flexible type, while at the front a duplex arrangement is adopted. The internal dimensions of the ambulance body are: length, 8 feet; breadth, 3 feet 10 in.; and height, 6 feet. The heating of the interior is accomplished by means of the exhaust from the engine, which

escapes to the atmosphere through a pipe fitted on the floor. This pipe is separated from the main exhaust pipe by means of a by-pass valve, which can be used to determine the exact amount of exhaust allowed to pass through the pipe inside the wagon. Electrical fittings have been provided in the shape of three ceiling lamps, and also a communicator by means of which instructions to the driver can be given from the interior to an indicator on the dashboard. The body is insulated from the chassis by means of rubber pads, and the full standard equipment of the Ambulance Association is furnished inside. On test the wagon, which is geared to a maximum speed of twenty-one miles per hour with the engine running at 1,100 revolutions per minute, has shown itself to be an exceedingly silent vehicle, and should prove of immense service in the work of the St. Andrew's Association.

### The Frothing of Accumulators.

In our correspondence columns this week a correspondent raises a query as to the cause of frothing in accumulators. As the trouble is not an uncommon one, the following remarks on the subject may be of general interest. Frothing is due to impurities in the acid, which may have come from the plates, or have been present in the water or the acid when first put into

the cells. To prevent its occurrence, empty out the acid, and thoroughly rinse the accumulator with two or three lots of distilled water, washing out at the same time loose pieces at the bottom of the cells. Then refill with dilute sulphuric acid, 1.200 specific gravity, using the best brimstone acid and distilled water. Frothing in accumulator cells has been a puzzle to the oldest makers of accumulators, and the exact cause of it has never been absolutely established. That it is due to impurities there is no doubt, as makers of ignition accumulators with long experience state that they never have cases of frothing occur when charging large numbers of new accumulators filled with absolutely new and pure acid, but every maker experiences frothing in old accumulators sent in for charging and filled with acid of inferior quality. Frothing appears to occur more readily in celluloid cells than ebonite, though cases sometimes occur with the latter type.

### Starting a Petrol Motor.

It is surprising how many motorists receive minor injuries and sometimes severe ones when starting up the engines of their cars, especially in view of the fact that, if proper precautions are taken, the operation is a perfectly safe one. When the motor is to be started the first thing to make sure of is that the car itself cannot prematurely start when the engine begins to run, by seeing that the change-speed lever is in the neutral position, thus completely freeing the motor from the driving mechanism. Neglect on this point has been the cause of several accidents, including one which, unfortunately, had fatal results, owing to the car bounding forward and knocking a youth down the well of a large lift. The next point to which attention must be given is the position of the ignition lever. This must be retarded to its lowest position, otherwise the engine may give a back kick, or back fire, as it is more popularly known, the result of which will probably be a broken wrist. The starting handle should be so engaged with its ratchet that the effort of starting the engine is in the form of an upward pull, never a push down. If this practice is followed, in case of a back kick the handle may, of course, be pulled out of the hand, but no injury is likely to be inflicted. If, on the other hand, the handle is being pushed forcibly downward with the arm nearly straightened out, and a back fire occurs, the blow to the arm, the shoulder and the rest of the body may be very severe. The motorist should also be sure that the handle is securely engaged by the ratchet so that it cannot slip off when he is pulling hard, and he should stand far enough forward from the front of the car to be out of the way of the handle. Several cars at present on the market are so arranged that the act of fixing the starting handle on its ratchet automatically retards the ignition, and the idea is one which may be recommended for general adoption. If the motorist is always careful about the position of the ignition lever, starts the engine with an upward pull of the handle, stands out of range of the latter in a well braced posture, and is sure that the car itself cannot start when the motor does, there is very little chance of personal injury in starting a petrol engine.

THE "Glico" motor lubricating oils and greases are the production of the Gas Lighting Improvement Co., whose Carburine has come well to the front as a high-class motor spirit.

MR. GURDON, a motorist, had a curious and unpleasant experience on Friday of last week at Rye. He was deceived by some lights on the opposite side of the tidal channel, and drove into the water. The car floundered for some time in the mud, and a traction engine had to be requisitioned to pull it out.

THE HERCULES MOTOR WAGON AND ENGINEERING COMPANY, Manchester, in addition to steam wagons, are now building motor-bus chassis fitted with 40-h.p. petrol engines. A special emergency brake has been designed operating upon the drum of the driving-wheel, which may be called into action by the conductor simply turning a wheel placed in a convenient position at the rear of the vehicle, and acting independently, although in consort with, the lever under the control of the driver.

THE Lancaster county magistrates have inflicted fines amounting to £145 this summer on motorists. There have been 28 convictions.

MR. FRED GREENWOOD, of the Leeds Motor-Cycle Club, has covered the distance between Leeds and London and back, a run of 368 miles, in 15 h. 50 min. on a Rex motor-cycle.

THE Zenith Motor Engineering Company have removed their City offices to their works at 101, Stroud Green Road, London, N.

MR. WILLIAM BOND is making a special study of motor work at his Sandown Cycle and Motor Works, Cannock, Staffordshire.

BISHOP'S AVENUE, Finchley, has been colloquially and locally re-named as "the scorcher's avenue." This has been stated in evidence at the Highgate Police Court.

MR. B. N. DOSS, of the National Cycle and Motor Company, Ltd., 98, Clive Street, Calcutta, invites dealers in automobile accessories, &c., to forward copies of their latest lists.

THE Cardiff Motor Garage Company, with which Mr. Gibbons Brooks is associated, are making considerable extensions to their premises in this populous South Wales centre.

MR. HUNT, J.P., at the last meeting of the Halstead Rural District Council, said that motor-cars should be taxed £25, the money thus obtained being devoted to the care of the roads.

MOTORING visitors to the City may be interested to learn that supplies of motor spirit may be obtained in any quantity at the depot of the Singer Cycle Company, Ltd., in Turn Again Lane, Farringdon Street, E.C.

A MOTOR-CAR arrived in Wallingford the other evening, and the occupants distributed packets of "tea" to a number of eager recipients, who, however, were not so grateful when they discovered the contents to be sawdust.

"MOTORING IN SCOTLAND" is the title of an effective brochure brought out by the Continental Tyre and Rubber Company, Ltd., whose tyres, as we mentioned at the time of the trials, did exceptionally well in that severe test.

AN attractive motor gymkhana has been held at Blandford by the Corporation Recreation Ground Committee, with Mr. W. A. B. Brennard as secretary, Mr. H. F. W. Farquharson having been largely responsible for the event.

WHEN at Teignmouth, on the occasion of his motor-car tour, General Booth's car, and the five others that accompanied him on the journey, were garaged at the establishment of Messrs. W. Bobbett and Son, whose place can accommodate between twenty and thirty cars. The firm are official repairers to the A.C.G.B.I., and have been able to render service to many motorists touring in Devonshire this season.

"AUTUMN LEAVES" is the pleasant title given to several pages descriptive of various useful oils for the use of motorists just issued by the County Chemical Company, Ltd., of Excelsior Works, Birmingham. Included therein are particulars of the company's standard carbide, G. B. motor carbide, motor oils, &c., as well as the G. B. vulcanisers—the latter a simple, cheap and effective apparatus for motor tyre repairs.

ALTHOUGH we are yet enjoying warm weather, we are within hailing distance of the winter, with its attendant cold weather and frost and consequent danger of burst cylinders, so that it is not too early for motorists to think of the matter of heating their motor-houses. In this connection we may refer to the Ascot boiler made by Messrs. Jones and Attwood, of the Titan Works, Stourbridge. This is specially designed for the warming of such buildings by means of hot-water pipes. It is simple in construction, and occupies little space, while it will heat from 12 ft. to 50 ft. of 4-in. pipes, and can be banked to last from twelve to twenty-four hours without attention. Messrs. R. Jenkins and Co., of Rotherham, are also making a serviceable boiler known as the Ivanhoe, intended for similar use. It is made in various sizes and requires but little attention, its construction being such that the fire will stay in all night without further stoking being required.

THE Hon. Mrs. Harbord has accomplished a 200 miles trip in Mr. F. H. Butler's balloon, in the competition for Miss Krabbe's cup.

THE attention of the London County Council is being directed to the danger to the public arising from the practice of teaching motor-car driving in Battersea Park.

THE Auto Cycle Club's hill climb at Birdlip Hill to-day (Saturday) has attracted seventy entries in the six classes.

LAST week Mr. Cecil Edge drove a six-cylinder Napier from Nottingham to Edinburgh, back to Nottingham, and then to London—a distance of 720 miles. The engine was not stopped from start to finish.

MESSRS. VOSPER AND CO., LTD., of Broad Street, Portsmouth, are making a feature of assisting motorists going to the Isle of Wight, by accommodating cars at their garage and seeing to their despatch by steamer.

AFTER making experiments, Messrs. R. and J. Pullman, Ltd., have succeeded in satisfactorily fitting their leather non-skid bands to tyres which have previously been fitted with studded rubber non-skids. Those they have already retreaded are giving great satisfaction.

AT the wheel of the Hardman car shown in the accompanying illustration is Mr. W. L. Hardman, of Colquith Street, Liverpool, who has entered and will drive the vehicle in the forthcoming Tourist Trophy race. The car, which is of French construction, is fitted with a four-cylinder engine, 110 mm. bore by 130 mm. stroke, and developing 25-h.p. at a speed of 1,000 revolutions per minute. Two systems of ignition—Eisemann

high-tension magneto and ordinary coil and accumulators—are provided. The clutch, which is of the leather-faced cone pattern, is connected by a universally-jointed shaft to the gear-box. The latter is of the Panhard type, and is adapted to give four speeds forward and a reverse, the final drive being by side chains. The car, which throughout is of the standard type, and has not been specially prepared for the race in any way, has a wheel base of 10 ft., the track being 4 ft. 6 in.

THE Mayfair Motor Company, Ltd., is the name of a new concern which has just opened a depot at 55, 57, and 59, Shaftesbury Avenue, London, W.C., for the sale of Mayfair cars. Four sizes are being made, viz., 6-h.p. single-cylinder, 10-h.p. double-cylinder, and 15-h.p. and 28-h.p. four-cylinder. The first three cars have cardan shaft transmission and live axles, while the largest vehicle is made with either a live axle or side-chain drive. We hope to refer to the Mayfair cars more fully in a later issue.

CALLING at 14, New Burlington Street, W., the other day, we found considerable alterations in hand, and ascertained that Messrs. S. F. Edge, Limited, intend to devote the ground floor to the purposes of a reception room, and use the whole of the top floor as a showroom. The latter will provide a very fine apartment for the display of cars. We also hear that it is the intention of Messrs. Napier to in future confine their energies to the production of 40-h.p. and 60-h.p. Napier cars of the six-cylinder type, of which close upon a thousand are being put in hand for next season.

THE Motobloc car which competed in the fateful Paris-Madrid race in 1903 is now in use in London as a motor delivery van by Messrs. Montague Hawnt and Co.

THE Rex Motor Manufacturing Company, Ltd., Coventry, are placing on the market a new 9-h.p. twin-cylinder, four-seated tonneau side-entrance car. It will have three speeds and reverse, and direct drive on the top.

WE illustrate herewith a new collapsible luggage carrier for use on touring cars which has lately been put on the market by Mr. H. F. Spence, of 128, Hope Street, Glasgow. As will be seen, it consists of a collapsible platform fixed at the back of the vehicle. The platform is constructed of special steel trellis work, which, when not in use, is contained in its collapsed condition within a shallow recess below the floorboard of the

back portion of the car. When the trellis work is drawn out it forms a platform to which luggage may be strapped, its outward ends being supported by means of a hinged rod at each side pivoted to the upper part of the back seat. The rods are attached to the platform by means of hooks, which enables the platform, when not required, to be collapsed without detaching the rods. The carriers are made in various sizes from 2 ft. by 4½ in. by 18 in. when open, and when closed they go into a space of 2 in.

UP to the conclusion of the last financial half-year 1,264 motor-cars, 1,455 motor-cycles, and 40 heavy motor-vehicles were registered with the Middlesex County Council since the Motor Car Act came into operation, while 7,879 drivers' licences were issued.

THE Doherty Motor Components Company, Ltd., Coventry, are very busy on heavy vehicle fittings. A recent walk through this firm's works revealed to us a large amount of business being done. The manufactures in the various departments include the following: spinings of every description, mechanical lubricators—of a simple form, floats, sight feeds, oil distributors, tanks, wings, fans, silencers, &c.

THE H.F. process of vulcanised tyre repair is well described in a new circular brought out by Messrs. Harvey Frost and Co., Ltd., of 39, Great Eastern Street, E.C., whose West End showroom is at 215, Shaftesbury Avenue, W.C. Motorists who are interested in the idea, but who have not yet adopted this form of vulcaniser, should obtain a copy of this explanatory circular, in which is enclosed a strip of rubber tube showing the various stages in repairing a puncture by this process. The list of users of the H.F. vulcanisers is growing to a formidable length, and includes several corporations and polytechnics as well as many prominent firms and amateur motorists.

A TWO-SEATED 6-h.p. Clement is being offered as a prize in a competition promoted by the "The Motor House." This firm ask automobilists to forecast the names of the first, second, and third cars in the Tourist Trophy trials on the 27th inst., together with the average times, and the competitor whose prophecy is fulfilled will receive as a prize the car mentioned above. The next most accurate estimators will receive a motor-bicycle, a pair of head-lights, and other valuable prizes. All forecasts must reach "The Motor House," 314-316, Euston Road, London, N.W., with the envelopes marked "Competition," not later than the first post on the morning of the race.

LADY ROSSMORE has recently purchased a Daimler car.

WE learn that the Metropolitan Asylums Board have just placed a contract with Mr. A. R. Garnett for two 18-22-h.p. National chassis, which are to be fitted with special ambulance bodies.

THE long-distance trial of a car fitted with Halle spring wheels, conducted under the auspices of the Scottish Automobile Club, was abandoned at Edinburgh, on account of two bolts holding the inner plate on the off front wheel having been shed.

MR. A. MEIER has erected new motor body building works on a piece of land between Ladbroke and Cecil Roads, Redhill. The premises are being fitted with a thoroughly up-to-date equipment of machinery and tools, and Mr. Meier is anticipating considerable business in bodies of a high-class character.

THE Crown Engineering Company, of 22B, High Street, and Clattern Bridge Wharf, Hogsmill River, Kingston-on-Thames, are opening premises for general engineering with a special view to the care, repair, fitting out, and storage of motor-cars and petrol, electric and steam launches. They stock petrol and oils.

THE "Graphic" Challenge Trophy Race will be held in the Isle of Man on the 28th inst.—weather and other circumstances permitting. It is to be hoped that there will not be a repetition of the abortive effort of last year, when the race could not take place owing to the mists that overhung the mountain road over Snaefell.

THE Anglo-American Motor Car Company have now on exhibition at their depot in Haddon Street, Regent Street, W., the first of the new Cadillac 26-30-h.p. cars. These are on entirely different lines to the standard Cadillac vehicle, being fitted with a vertical four-cylinder engine and cardan shaft transmission. We hope to refer to the new car more fully in a subsequent issue.

A NEW variable air inlet for use in connection with carburettors has recently been put on the market by Mr. Ernest E. Davies, of Great Bookham. It takes the form of a cone arranged to slide in a metal sleeve, which forms the carburettor end of the air inlet pipe. In the accompanying illustration the sleeve D is indicated by dotted lines, while B is the inner sliding cone, which has a hole drilled through its centre at A. The rear end of the cone is of special shape, as shown, and has two threaded holes to receive bolts, which pass through slots C in the sleeve to enable any suitable actuating mechanism to be attached. The end of the inlet pipe with its cone is arranged horizontally into the spraying chamber of the carburettor in such a way that the air is directed on to the spraying nozzle. The air enters as indicated by the arrow, and when the cone is fully advanced must all pass down the contracted central hole. By sliding it to the rear in the sleeve it gradually clears the sides

of the latter, air being then able to pass by the exterior of the cone as well as down the central hole. Thus at the highest engine speeds the fullest amount of air can be given, while as the speed decreases the air area is contracted, to give the requisite richness of mixture. The arrangement is very simple, and Mr. Davies claims it gives a greater range of air control than is possible by any other means, and that it effects considerable economy in petrol, tests made with it on a motor-bicycle having resulted in a greatly increased mileage per gallon of petrol. Another advantage put forward for the device, which is being made in sizes for both car and cycle engines, is that it enables a motor to be started upon the first turn of the handle without it being necessary to flood the carburettor.

## CONTINENTAL NOTES.

### The Austrian Military Manœuvres.

In addition to a number of cars belonging to the newly-organised Motor Volunteer Corps, four motor-wagons with trailers, an armoured car, and four motor-cycles are being employed by the Austrian military authorities in connection with the manœuvres in Austrian Silesia. The wagons, to each of which three trailers are attached, are driven by expert chauffeurs, accompanied by two mechanics from the engineers' corps. The 40-h.p. armoured car, which was built at the Austrian Daimler Company's works, is a weird-looking machine. All four road wheels are direct driven, an arrangement which enables the vehicle to be run over any kind of road. Experiments which have already been made show that it can go down into a ditch and come out again without any difficulty, while crossing a rough field is quite within its capabilities. The whole of the car is enclosed by steel plates. The driver and the gunner occupy the usual position, but, when necessary, even they are made to disappear from view, and the machine has then the appearance of a block house, the only openings

his task with great pluck and successfully completed the whole of the journey. The other Siddeley, driven by Mr. Farrell, ran with the utmost consistency throughout, and only on one day failed to reach the control inside the time limit. The delay was caused by an accident, a broken lamp bracket breaking the oil pipes and knocking a hole in the petrol tank. The severity of the contest may be further gauged from the fact that, of the forty-nine competitors who started, only twenty-six were classified at the finish. Of these, seven cars—three De Dions (8-h.p., 12-h.p., and 24-h.p.), a 12-h.p. Darracq, a 12-h.p. Cottareau, a 16-h.p. Clement-Bayard, and a 40-h.p. Mercedes—made the tour of France without being penalised in any way. They are consequently all classed as winners, the main prize of 25,000 francs (£1,000) being divided between the drivers of the same.

### The Coupe d'Auvergne.

Forty-eight entries were received by the Automobile Club d'Auvergne for the touring contest for the Coupe d'Auvergne, which started at Clermont-Ferrand on the 3rd inst., and finishes to-day (Saturday). The weighing-in took place on Sunday, when only 32 competitors put in an appearance, they being

The Austrian Military Motor Road Trains leaving Vienna for the Manœuvres.

[Allgemeine Automobil Zeitung.]

being those by which the driver looks out, and others in the turret at the rear, through which projects the muzzle of a machine gun.

### The Coupe Du "Matin."

As briefly mentioned in the last issue of the *M.C.J.*, the two British cars entered for the Coupe du "Matin"—both 32-h.p. Siddeleys—successfully completed the strenuous test which, commencing on the 2nd ult., finished in Paris on the 28th ult. The trial included the crossing of the Pyrenees and the Alps, the total distance being 3,730 miles over all kinds of roads and in all kinds of weather. Each day's run averaged about 150 miles, and the cars in their various classes had to cover the distance within a certain rate of speed with a time limit, the section in which the two Siddeleys were entered having to keep up an average of 45 kilometres (26½ miles) per hour. It will readily be seen that the test was one not only of cars but of drivers; many of the latter were soon physically indisposed, amongst them being Mr. Stead, who was driving one of the Siddeley cars. Despite this great handicap Mr. Stead stuck to

divided into the following six classes:—Motor-bicycles; motor-cycles; single-cylinder cars up to a maximum bore of 120 mm., and capable of maintaining an average speed of 25 kilometres per hour; two-cylinder cars, maximum bore 120 mm., or four-cylinder cars, 90 mm., maximum speed 30 kilometres per hour; four-cylinder cars, 120 mm. bore, 35 kilometres per hour; and four-cylinder cars, 140 mm. bore, 40 kilometres per hour. The first day's run was to Vichy, a distance of 182 kilometres, the best time (3 hrs. 21 min. 3 sec.) being made by Rigolly on a Gobron car. Tuesday was devoted to an exhibition at Vichy. On Wednesday the run was to Le Puy, 199 kilometres, and on Thursday to Aurillac, 200 kilometres.

### Miscellaneous Items.

A large number of motor-cars are to be made use of in connection with the forthcoming military manœuvres in Switzerland.—The Kaiser has just acquired a new 60-h.p. Fiat car.—A motor-car service for the transport of the mails is about to be started between Saint Dié and Wissembach (Vosges).

## CORRESPONDENCE

Letters to the Editor should be addressed to the offices,  
87-88, Charing Cross Road, W.C.]

### THE GOVERNMENT AND ALCOHOL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The motor industry in this country has recently had occasion for disappointment over the new regulations issued by Inland Revenue authorities in connection with the Alcohol Act, which comes into force on October 1st next. No advantages whatever accrue to motorists by virtue of these new regulations, whilst, on the other hand, the chemical industry materially benefits.

The Government helps those who help themselves. The chemical industry, led by Mr. Thomas Tyrer, has worked for some considerable time for these concessions, and this has now culminated in governmental recognition. Motorists, however, have done nothing to further the cause of alcohol as a motive power for internal combustion engines, and, consequently, the Government encourages those who have done something for their case, whilst practically the non-

Miss Camille Clifford on the Hon. H. L. Bruce's 40-h.p. De Dietrich. Mr. Bruce is standing by the side of the Car. (See page 578.)

recognition of the motorists' case amounts to a reproof for its inactivity and want of enterprise.

It seems difficult to see what other course was open to the Government in view of the apathy which the motor industry in this country has hitherto shown in the question of a home-produced fuel. There is no doubt whatever the Government will be quite ready to help this question when motorists themselves become more active. The economic, industrial and social advantages to be derived from the general adoption of alcohol as a motive power, and for lighting and heating purposes, are so far-reaching that no Government will be able to resist the tide of public opinion when it has been educated to realise these advantages.

When agriculturists, motorists and the public generally are ready the Government must inevitably act as the natural outcome of that public opinion. If confirmation of this view were needed, one has only to study the opposition which the Free Alcohol Bill met with in America from the Oil Trust and other interested parties, but the advancing alcohol movement simply crumpled it up.

It is to be hoped that motorists will immediately set their house in order by removing the Governmental reproach which has been provoked by the want of enterprise shown by motorists in this country.—Yours truly,

RADFORD COOKE.

### THE STEAM CAR CHALLENGE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Replying to Mr. Edge's letter in your last issue, the Mont Ventoux hill climb of September 15th and 16th I do not care for, as it is not a touring car contest. Moreover, business would not allow me to leave London at this time of year for as long a period as would be necessary should I care to enter in that competition.

As to the Graphic Trophy, I understand from the Automobile Club that it is to be run from the Quarter Bridge just outside Douglas to the fifth milestone on the Castletown road. The average gradient for this course is 1 in 100. There is no hill-climb about that. My car is no racing car, nor have I ever proclaimed it as such. I would not claim, and never have claimed for my 18-h.p. car equal speed or higher speed than the 60-h.p. Napier, except on steep gradients—long or short, I care not which.

My car, as I have before stated in correspondence with Mr. Edge, is a standard 18-h.p. White touring car. I am not able, as are those whose factories are in England, to build to any specification that may suit my fancy, but, on the contrary, am confined to my standard model.

I am sorry we cannot agree as to a match on the lines of my original proposition, but Mr. Edge and I will no doubt be engaged in next season's hill-climbs, and I am sure, if he proves himself as willing to back his opinions as I am, somebody is bound to win a purse or two. Modesty prevents me from suggesting who that somebody will be.—Yours truly,

FREDERIC COLEMAN.

### OLDSMOBILE QUERIES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR.—Could you kindly tell me the proper lift of air valve of an Oldsmobile 5½-h.p. car? I should also like to know whether it would be an improvement if it were made automatic. What should be the exact lift of the exhaust valve, and where should the crank be when the exhaust valve is just opening? The carburettor I have is of the Oldsmobile type. Could it be improved, and what could I do to it? Also as regards the contact, would a wipe or a make and break contact be better, using, of course, a trembler coil?—Yours truly,

R. W. W. JOHNSTONE.

The proper lift of the inlet-valve on the 5½-h.p. Oldsmobile is ¾ in. The engine will not work so well with an automatic inlet-valve as it does with the mechanically-operated one. The lift of the exhaust valve is ¼ in., and the position of the crank is 10 degrees early when the exhaust valve is just opening. The correct way to fit the camshaft is to first place the valves and valve levers in position, then turn the crankshaft so that the piston is in its back position ready to commence the inlet stroke; next place the cam-shaft with the exhaust cam just clear from the exhaust cam roller, and the inlet cam just ready to lift the inlet cam roller. There is a little clearance allowed between the cams and the cam rollers, but not sufficient to allow the worm on the camshaft to be geared in a wrong position, so the worm may then be keyed on the camshaft. If the carburettor is as first supplied with the car, it cannot be improved; the chief point about it is to adjust the petrol feed from the seat so as to give the best results, and it should then be possible to run from thirty to forty miles on one gallon of petrol. By fitting a wipe contact better results will be obtained than with the present make and break arrangement.

### THE ROYAL COMMISSION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—If the proposed increase in taxation be confirmed it will undoubtedly affect the production of motor-cars. The representatives of motorists ought to vigorously protest against this increase in taxation.

At present, by paying 15s. a year for a two-wheeled Ralli car or a guinea for a four-wheeler, one is able to take one's family for a ride. I take it that to be able to do this with a car it means a 10-12-h.p., which would come into the five guineas area.

All cars under a ton weight should be no more than two guineas tax; any car over that weight would be found among the class of people of more than moderate means.—Yours truly,

A WAITING PROSPECTIVE MOTORIST.

### RACING THE MOTOR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Many, I think I may say all, motorists know the value of this practice to see that all is in order with the ignition, &c., but few, I think, know the actual limit to the maximum speed a motor may be run at without a load or which factor it really is that sets the limit to that maximum. I do not, and I am writing in the hope that one of your readers may be good enough to set me right. Take, for instance, a six or eight-cylindered motor being tested on the bench. Is it usual to race such an engine absolutely as fast as it will turn? Or would such a policy end in destruction of the machine? Again, will any modern system of ignition function without misfiring at such speeds? Further, in advancing the ignition when racing the motor, the critical point above which it becomes detrimental to advance must surely be approached very carefully, or a broken crankshaft might easily result. I would be very much obliged if one of your correspondents would be kind enough to put me right on these points, and, if possible, give a rough outline as to the methods of testing multi-cylindered motors, e.g., those for racing cars, and inform me up to what speeds they are tested. I have watched a well-known driver testing a six-cylinder engine, and he certainly made it "buzz" considerably, but whether it was "cracked

up" on the ignition as far as it would take it, or whether such a course is ever adopted, I do not know, and should much like to.—Yours truly,  
"TESTER."

BUEA BUEA

In testing a motor it is not, as a rule, the practice to work it as fast as it will run (without load), as it is quite possible to run as high as 2,000 or more revs. per min., but at this high speed one is likely to somewhat strain or even break an engine up. In workshop practice an engine is usually tested under load at a given number of revs. per minute, the point of ignition being determined whilst under load, but upon the load being taken off the engine immediately races away, the point of ignition still remaining in the same position as when running under load, although an increase of speed perhaps equal to 50 per cent. is obtained.

The highest point that the ignition can be advanced may be determined by slowly advancing until a slight knock is obtained (similar to that of overload whilst hill climbing), when the engine will be found to somewhat decrease in speed, owing to premature firing, but, slightly retarding, the highest point is obtained. This, of course, would be much too far advanced for running under load. All modern systems of ignition will work at this high speed without misfiring if properly adjusted.

### DIRTY GARAGES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—All the tyre makers' hand-books that I have come across mention the fact that oil is very destructive of motor tyres, a fact that I should like, through the medium of the *M.C.J.*, to impress on the owners of motor garages. I have lately been for a tour along the South Coast and have put my car up at the leading local garages. I am sorry to say that many of these are not as well kept as they might be, the floors in particular being bespattered with oil, which had no doubt leaked from the stored vehicles. It is anything but pleasing, when you go to get your machine out in the morning, to find that one or more of the wheels have been resting overnight right on one of these greasy patches. The annoyance could easily be obviated if the owner of the garage made it the duty of one of the boys about the place to see that the floor is kept free of oil and grease.—Yours truly,

SEASIDE TOURIST.

### MATERIAL FOR VALVE GRINDING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to Mr. Williams's inquiries for the best method for valve grinding, I can assure him that he cannot do better than to carry out the following advice, viz.:—In the first place get a drill brace with a screwdriver to fit same, then mix some medium emery powder with thin lubricating oil, and place a thin layer on valve, then grind the valve in thoroughly by repeating the layers of emery on valve, taking great care to lift the valve from its seating after every few revolutions made by the screwdriver, so as to prevent the powder from scoring the seatings. After grinding the valves in thoroughly with medium emery powder repeat the same operation with much finer emery powder or pumice powder; by doing this he will obtain good results. He must take great care to wash out all parts of valves thoroughly before replacing them in their proper position, so as to make sure that there will be no dirt or grit under the seatings; also notice must be taken to see that all the valve stems have at least  $\frac{1}{16}$  inch clearance between the tappets, to allow the valves to bed down in their seating.—Yours truly,

H. HUDDLESTON.

### GRINDING IN VALVES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am a constant reader of the *M.C.J.*, and in last week's issue I saw a letter on grinding in valves and signed G. Mulliner. This gentleman asks readers to give him their opinions on the point. In reply to this, I wish to state that in my opinion emery powder is far too coarse to leave a valve at, so I must say I have got the best results in this manner. If valve is very bad, start grinding with emery and finish with knife powder and paraffin; this gives a far better result, as I have experienced, in the grinding of valves. I may mention that I give one or two grinds of the valve. and then lift it off the seat, and so on.—Yours truly,

H. CURTIS.

### FROTHING OF ACCUMULATORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—On opening the small wooden box containing my 60-amp. hour accumulator the other day, I was surprised to find the top of the cellulose case all covered with froth. I should be greatly obliged if you or any reader of the *M.C.J.* could tell me the cause of the same, whether it is detrimental to the battery, and also how best to prevent its recurrence.—Yours truly,

J. C. PERRY.

[A reply to the query raised by our correspondent, which is of general interest, will be found elsewhere in the present issue under the heading of "Current Topics."]

### OXYGEN AND PETROL CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have noticed several suggestions recently as to oxygen being employed in place of air in forming the explosive mixture with motor spirit for use in petrol engines, but can obtain no definite information on the subject. Perhaps some of your more expert readers can throw some light on the matter.—Yours truly,

R. J. ELLIOTT.

### THE ELECTRICAL MOTOR-BUS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It would be interesting to know what has become of the electrical motor-bus about which so much was heard three or four months ago. According to the daily papers at the time the ideal public service vehicle had at last arrived, and that within a short time forty of the vehicles would be on the road in London. Where are they? —Yours truly,

WESTMINSTER.

### A SUBSTITUTE FOR THE INSPECTION PIT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Being a reader of the *M.C.J.*, I noticed in your issue of May 19th last an article entitled "A Substitute for the Inspection Pit." My employer was getting a new 10-12-h.p. car at the time, and, as it was not convenient to have the flooring torn up to make a pit, I put the suggestion before him and got his sanction to have a platform made by a local joiner, with a geared drum added, by which to pull the car up, as I thought this would be better than having to run the car up by its own power. I have also small wheels attached to the stationary legs so that the

platform can be wheeled to wherever it is required. It has been in use for some time now and it has turned out a great success, as it can be placed where a good light is available to work by and no danger of explosions from accumulated gas. I may state that one man can pull the car on to the stand without trouble. I send you two photos of the platform with the car up, as I thought you might like to reproduce the same in the *M.C.J.*—Yours truly,

UTILITY.

### THE TOURIST TROPHY COURSE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We notice from your issue of the 25th ult., that the course for the Tourist Trophy Race in the Isle of Man this month has been altered. As far as we are concerned, we have had no official notification of this alteration, and we must emphatically protest against any change being made in the course at a time when all cars entered have been completed and on the road for some time. No indication has ever been given that any alteration in the course was contemplated, so that we, in common with other manufacturers, have naturally constructed and adjusted our cars with a view of getting the best results possible over last year's course. We have endeavoured to make the most of our experience last year, so consider it monstrous that any alteration should be made at this time, more especially in view of the fact that we are led to understand that the new course as now suggested is a somewhat more difficult one than that of last year, and may be expected to cause a higher petrol consumption.—Yours truly,

ARGYLL MOTORS, LTD.

THE "THUNDERER" WHISTLE.—A correspondent will be glad to learn the address of makers of the Thunderer whistle for motor-cars.

## HINTS ON THE CHARGING AND CARE OF ACCUMULATORS.

SOME useful hints in regard to the charging and care of accumulators are given in the catalogue recently issued by Messrs. Peto and Radford, Ltd., from which we take the following:—

An accumulator or storage battery has to be re-charged with an electric current from any source, such as a primary battery, a small dynamo, a set of large accumulators, or from the mains of the continuous current electric supply company. Accumulators can also be charged from an alternating supply, provided an apparatus called a "rectifier" is used in the circuit. Whichever method of charging is adopted, the pressure of the current must be suitably regulated, so that the correct quantity of current is passed through the cells of the accumulator. The method of arranging and regulating the current will depend upon which of the above methods of charging is adopted. We will, therefore, take them separately.

**Charging from Primary Batteries.**—In this case the primary battery will have to be arranged with a sufficient number of cells to give a greater pressure in volts than the battery to be charged. As an accumulator cell has a pressure of 2 volts, and no primary cell has a pressure above 1.9 volts, it is always necessary to have a greater number of primary cells than there are storage cells to be charged. For instance, in charging a 2-cell 4-volt accumulator, a 3-cell or 4-cell primary battery must be used, so that the effective working voltage on the terminals of the battery is at least 5 volts. It is best to allow  $2\frac{1}{2}$  volts for every accumulator cell to be charged, and regulate the current exactly, by using a small iron wire, or german silver, resistance coil and switch.

**Charging from a Small Dynamo.**—If the dynamo is one of small voltage (8 to 10 volts), it should be run until it gives 25 per cent. higher voltage than the accumulators to be charged, and the current can then be switched on to the cells. If the dynamo is of high voltage, say, 100 volts, as used in electric lighting in factories, &c., it will be necessary to use a resistance in the circuit, made up of two or three incandescent lamps in parallel; these lamps can either be pendants or electroliers in use for the ordinary lighting, or they can be fitted on to a special charging board. In charging a four-volt accumulator by this method, as only 5 volts is required to send the necessary current through the accumulator, it is absolutely necessary to absorb the remaining 95 volts, which the dynamo is capable of giving, and the cheapest form of resistance for doing this is a few incandescent lamps.

**Charging from a Set of Large Lighting Type Storage Batteries.**—We refer to the large sets of storage batteries used in connection with electric lighting plants in country houses, &c. All that is necessary is to connect up the accumulators to be charged to one more cell of the lighting battery than the number of cells to be charged, using a small resistance to regulate the current. For instance, in charging a 4-volt accumulator, connect up to three cells with a resistance; in charging an 8-volt accumulator, connect up to five cells. For higher voltages, increase the extra number of cells on the charging set, so that you always allow  $2\frac{1}{2}$  volts for each cell charged.

**Charging from Supply Companies' Mains.**—It is necessary to have a suitable switch and terminal arrangement fitted up, so that the accumulators can be connected in a lighting circuit, without chance of short circuit or shock from the wires. There are several methods of doing this, and it is necessary in the first instance to carefully mark the terminals, positive and negative, and to insert the necessary charging board in a circuit of sufficient lamps to give the required current. We recommend the advice of an electrician being taken on these points, or we shall be pleased to give full instructions to meet every individual case. The system, briefly, is arranged so that the current flowing through a lamp, or a few lamps, in the house circuit, will also flow through the accumulator, before it returns to the mains.

The separate compartments of all liquid accumulators are filled with a dilute solution of sulphuric acid (oil of vitriol). Great care, therefore, should always be taken to keep the accumulators upright, to remove any acid which may escape up on the top covers of the cells, and to immediately wash off acid which may be spilt on the brass terminals or other metal parts.

**Acid Solution.**—Purity is the most important matter in obtaining the necessary solution to fill the cells. The acid should consist of "best Ormston sulphuric acid" or "sulphuric acid for electrical purposes," which should be diluted with distilled water to a specific gravity of 1.180 degrees. This is approximately equal to a mixture of the following portions by measure: one part of sulphuric acid to five parts water. In mixing acid, heat is always generated, owing to the energy due to the chemical combination between the sulphuric acid and the water. Therefore, the sulphuric acid should be added to the water (not *vice versa*) and it should be added very slowly in a thin stream, and the mixture stirred with a glass rod. Allow it to cool before filling the cells.

**Filling the Cells.**—The cells of an accumulator should be filled with acid so that the level of the liquid is well over the top edges of the plates, but not up to the lead bars which connect the plates together. Allowance should be made for the fact that dry plates will absorb a certain amount of acid and reduce the level, shortly after they have been filled up. When charging always take the vents out of accumulators.

**Short Circuiting.**—Accumulators are injured if the terminals are connected together accidentally by any metal or other substance which

has a low resistance. This is termed "short circuiting" the accumulator, and causes an excessive current to flow across from one terminal to the other, owing to there being no resistance to the flow of the current to check it.

**Charging an Accumulator.**—It is most important to remember that an accumulator must always be charged in the right direction, otherwise the plates will be spoilt. To charge in the right direction, always join the terminal marked + (positive) to the positive wire of the charging circuit and the terminal marked - (negative) to the negative wire of the charging circuit.

**To Obtain the Best Results from an Accumulator:—**

See that the first charge is twice as long as an ordinary charge.

Have acid and water of absolute purity.

Never fill up with tap water, or water from an impure source.

Always charge as nearly as possible to the correct charging rate, within 15 per cent. either way.

Always charge in the right direction.

Always charge for a sufficient time to obtain the full capacity.

Always have a battery recharged as soon as possible after it has been completely discharged, and if it is inconvenient to charge it immediately, remove the acid whilst it is standing idle.

Keep the acid at the right strength and level.

Keep the tops of the cells scrupulously clean, and free from dust and moisture.

Give immediate attention to any appearance of corrosion on the terminals.

## THE VANDERBILT CUP RACE.

THE Vanderbilt Cup race, which is to be held on October 6th, will be run over a thirty mile circuit on Long Island, this having to be covered ten times. The course is slightly different to that followed last year: the changes made have been decided upon with a view to eliminating certain defects of last year's route, as well as to provide for the changed conditions found on some of the roads.

As the result of the alteration, the course now has eleven turns instead of seven, but against the increase in curves may be cited the reduction of level crossings to one as well as the elimination of a number of spots at which accidents occurred last year.

For the eliminating contest for the American team, which is to be held on the 22nd inst., there are fifteen entries, these comprising three 115-h.p. Thomas cars, three 110-h.p. Fraser-Millers, a 90-h.p. Locomobile (petrol), a 50-h.p. Haynes, a 120-h.p. Pope, a 110-h.p. Christie, a 60-h.p. Mathieson, an 80-h.p. Oldsmobile, an 80-h.p. Maxwell, a 50-h.p. Apperson, and an 85-h.p. B.L.M.

## NEW COMPANIES REGISTERED.

**EMPIRE SPRING WHEEL.**—£35,000. To adopt an agreement with Messrs. A. S. F. Robinson and W. D. Loveday, and to carry on the business of manufacturers of and dealers in spring wheels, &c. First directors, Messrs. F. W. Kerr, A. S. M. Robinson, W. D. Loveday, R. G. Pollock, W. W. Mattingley, G. C. R. Harvey, and D. J. McIntyre.

**PULLCAR MOTOR COMPANY.**—£30,000. First directors, Messrs. G. Dewhurst, S. Crompton, J. Worrall, and W. Baines. Kay Street Mill, Kay Street, Preston.

**AUTOMOBILE AGENCY AND AUCTIONS.**—£5,000. To adopt an agreement with Messrs. Moore and Spiers, and to buy, sell by auction, exhibit, and deal in motor-carriages, &c. St. Benet's Chambers, 1, Fenchurch Street, E.C.

**P. P. MOTOR COMPANY (BOURNEMOUTH).**—£1,000. First directors, C. Poosa (managing director) and P. H. Parsons.

**HIRING AND AGENCY.**—£5,000. To acquire, on the terms of an agreement with H. Cooney, the business of an automobile engineer and factor carried on by him as the Commercial Motor Company. The first directors are H. Cooney (chairman), and Dr. G. H. Hooper.

## MOTOR-BUS SMOKE.

MR. HOPKINS has heard at Lambeth a summons taken out by Mr. C. W. Tagg, town clerk of Camberwell, against the Star Omnibus Company, Ltd., of New Kent Road, for unlawfully using on the highway at Commercial Road, Peckham, a motor-bus which did not consume, so far as practicable, its own smoke, contrary to Section 30 of the Highway and Locomotives Amendment Act, 1878. The magistrate said he had been into the matter with great care, and had come to the conclusion that he must convict. He took it as absolutely proved that this bus was letting off a quantity of that smoke or visible vapour which they all knew so well by sight and by smell. So far as he could find there was no other way of proceeding against the motor-buses of London making this horrible smell and smoke except under this Act. It had been said that it was a great hardship upon the companies, but under the Act the companies could absolve themselves by bringing before the Court any servant through whose act or default the offence arose. This smell and smoke arose because silly workmen would overflow their machinery with oil, and they were the people who ought to pay the penalty. He ordered the defendant company to pay a fine of 40s. and £3 3s. costs. His worship expressed his willingness to state a case.

## CLUBS AND ASSOCIATIONS.

### KENT.

ON Saturday the meet of the Kent Automobile Club was held at Hawkhurst. Tea was arranged at the Queen's Hotel, and a large number of members and friends were present, including Col. Henderson, Mr. and Mrs. Austin, Mr. and Mrs. Maybury, Mr. and Mrs. Wyllie, Mr. Neate, Mr. Stace, Mr. Page, Mr. and Mrs. Baily, the Hon. Sec. and Mrs. Kenyon, Miss Beatrice Bartlett, and Miss Russell.

### HERTFORDSHIRE.

In the tropical heat this club brought to a successful issue the driving test for members on Saturday last. The spot chosen was the hill overlooking the Vale of Aylesbury, and is a gradual rise from the Tring road to the foot of Aston Clinton. There were three classes—cars,

ing was undertaken by the chairman of the sports committee, Mr. J. W. Whittall.

The next event is the members' fifty miles reliability run from Hatfield to Biggleswade and back, for cars, tri-cars and motor-cycles, on September 15th.

### NORTH-EAST LANCASHIRE.

A TOUCHING sight was witnessed at Preston on Saturday, when 200 crippled children were, thanks to the generosity of the North-east Lancashire Automobile Club, conveyed in up-to-date motor-cars to St. Anne's for a half-day's holiday. Fifty cars assembled at the public hall at noon, and the guests included crippled children from the Royal Infirmary in charge of nurses. The weather was gloriously fine, and refreshments were provided at St. Anne's, the procession being greeted with hearty cheering en route.

### IRISH.

THIS club held a very successful motor-car gymkhana on the 28th ult. It took place in the grounds of St. Andrew's College, Donnybrook, and as these grounds were close to the Horse Show, a number of those who were assisting at this festival were enabled also to take part in the

The Coupe du "Matin." The arrival of the competitors in Paris. (See page 585.)

tri-cars and motor-cycles. In the car class the judges arranged that should two or more competitors come out with equal points the prize (kindly presented by the chairman of the club, Mr. McWhirter), should be awarded to the car doing fastest time.

Mr. W. Frank Young's 10-h.p. Alldays secured this event, doing faster time than Mr. F. R. Hodson's 8-10-h.p. Humber, who tied the winner on points in facility and neatness of performance, but was slightly slower over the course. Mr. W. H. Colliver's 12-h.p. De Dion was third. The test consisted of stopping between two lines, reversing about 15 yards, stopping again between two lines, starting and proceeding to finish, when final stop was made between two tapes.

The Tri-car class was evenly contested, and it was necessary to send the Raleighette, Riley and Singer over the course again. Miss Seed, the winner, drove a Raleighette and made a remarkably fine performance, beating the Singer, admirably steered by Mr. B. Holland, by one point only. Mr. V. Riley, 9-h.p. Riley, was a close third, and would no doubt have done better but for ignition troubles just before starting.

In the Cycle class Mr. J. S. Harwood won with ease, and it was a revelation to see how slowly his 3-h.p. Triumph took the incline without stopping, and he is to be congratulated on a bit of very skilful driving. The test was a severe one, to make slowest time between two fixed points with a flying start, machine to keep an absolutely straight course.

The judging at the centre tests was performed by Messrs. E. and N. B. Kenealy, Mr. C. Wheeler taking final test and time. The start-

gymkhana. The latter was under the patronage of their Excellencies the Lord Lieutenant of Ireland and the Countess of Aberdeen, who drove to the grounds on their Daimler car, Lord Aberdeen being at the wheel. They were received by Sir Horace Plunkett, K.C., V.O., the president of the club, and Mr. Edward White, hon. sec.

The bending race was won by Mr. J. B. Dunlop, jun., who was very successful during the afternoon. The balloon competition was one of the most interesting events, and a tie resulted between three of the competitors, Mr. A. P. Coote, Mr. J. B. Dunlop, jun., and Dr. C. E. Boyce, who broke four out of a possible five balloons.

Bending Race.—J. B. Dunlop, jun., 10-12-h.p. Humber, 1; R. J. Mccredy, 10-h.p. Adams-Hewitt, 2. Fifteen competed.

Ball and Bucket Race.—Hum Bland, 10-h.p. Boyer, 1; J. B. Dunlop, jun., 10-12-h.p. Humber, 2. Twelve competed.

Balloon Competition.—After a dead heat between Mr. A. P. Coote (12-16-h.p. Humber) J. B. Dunlop, jun. (10-12-h.p. Humber), and Dr. C. E. Boyce (14-20-h.p. Renault) who each broke four balloons out of a possible five, the competition resulted as follows:—Dr. C. E. Boyce, 1; Mr. A. P. Coote, 2. Dr. Boyce broke three balloons, and Mr. A. P. Coote two, in the run off. Twenty-six competed.

Glass of Water Race.—H. Robinson, Clement-Talbot, time 23 4-5 sec., 7 oz., 1; E. M. Stirling, Richard-Brasier, time 30 sec., 6 1/2 oz., 2. Twenty-three competed.

Victoria Cross Competition.—S. Saunderson, 25-36-h.p. Richard-

Brasier, 1; 1 A. W. Inglis, 10-h.p. Adams-Hewitt, 2. Twenty competed.

Tortoise Race, 100 yards.—T. R. Scott, 10-h.p. Stanley steam car, 1; W. R. McTaggart, 12-14-h.p. Argyll, 2. Twenty competed.

Appearance Competition (for general appearance of car and occupants).—Miss Violet Hely, 24-h.p. Panhard, 1; J. B. Dunlop, jun., 10-12-h.p. Humber, 2; F. Conan, 16-20-h.p. Clement-Talbot, 3.

At the close of the competitions the prizes were distributed to the successful competitors by Mr. Hum Bland.

### WEST SURREY.

A HILL-CLIMB for members, under the Closed Competition Rules of the A.C.G.B.I., was held on Saturday at Blackdown, by kind permission of Mr. Phillipson Stow, the cars having to make two runs up the hill, and being handicapped by their actual times on the first run, subject to the penalty of disqualification if their second run—the actual race—was more than 10 per cent. better than their first.

Fifteen cars had entered, of which eleven arrived at the start, two, however, being disqualified for late arrival.

The times for the two runs were as follows:—

Owner.	Car.	m. s. 5ths	m. s. 5ths
F. Houghton ...	14-h.p. Renault...	5 0 1 ...	4 28 4
A. Fennings ...	12-14-h.p. Argyll ...	5 20 0 ...	5 0 0
R. W. Buttemer ...	14-h.p. Renault ...	5 32 0 ...	5 36 4
A. Leon ...	14-h.p. Renault ...	5 34 0 ...	4 48 0
L. Pullman ...	16-h.p. Aries ...	5 41 0 ...	6 3 0
J. W. Ponsford ...	8-h.p. Clement ...	6 9 2 ...	6 13 2
Col. Fairtlough ...	12-h.p. Darracq ...	7 -9 3 ...	7 3 2
Dr. Minchin ...	8-h.p. De Dion ...	7 41 3 ...	7 12 2
E. E. Pullman ...	15-h.p. Durkopp ...	7 54 2 ...	7 35 0

Messrs. Leon and Houghton were disqualified for exceeding the ten per cent. margin, and Dr. Minchin proved the winner of the handicap.

The 12-15-h.p. seven-seated Arrol-Johnston Car supplied to the Bristol Tramways and Carriage Company, Ltd.

Dr. Fenrings being second. No watches or speed indicators were permitted on the cars.

The judging was undertaken by Messrs. C. W. Crawley and J. W. Orde, while Messrs. Woollen and Straight acted as timekeepers. At the close of the proceedings the members and friends to the number of about sixty were most hospitably entertained by Mr. Stow, who was, however, unable himself to be present, to the general regret of the company.

### DUBLIN.

THE members of the Dublin centre of the Motor-cycle Union of Ireland entered on the second round of the Canning Cup competition on Saturday. The course was from Dublin to Carlow and back, a distance of one hundred miles. The following qualified for full marks as under:—

R. C. Price ...	2½-h.p. F.N., non-stop	... 100 Marks.
W. H. Guilfoyle ...	2½-h.p. Minerva, non-stop	... 100 "
E. Murphy ...	2½-h.p. F.N., non-stop	... 100 "
W. Jacques ...	3-h.p. Alcyon, non-stop	... 100 "
E. Farmer ...	3-h.p. Triumph, non-stop	... 100 "

C. E. Ellis, 3-h.p. Alcyon, did not finish. The second reliability test takes place to-day (Saturday).

### MOTOR YACHT CLUB.

THE last club handicap of the season took place on Saturday. There were twelve entries, of whom ten crossed the starting line. The handicapping was based on the speeds and former performances of the boats, and Captain E. T. Dixon again worked out the starting times. By this scheme, the boats—whether large or small, high-powered or low, cruisers or racers—should all start at short intervals, and should, if the handicapping were perfect, finish in one straight line. Unfortunately there are many factors that influence the steady running of a motor-boat, and it is difficult to handicap them twice consecutively with the same result. It was so in this case. The course was the one usually adopted for club handicaps. The varying speeds of the boats as they passed one another and sometimes rounded the buoys two or three at a time, added

a kaleidoscopic effect to an extremely pretty picture. The party of members and guests on board the "Enchantress" must have felt satisfied with the lovely surroundings of their club. Results were as follows:—

Name.	Start. h. m. s.	Finish. h. m. s.	Result.
Penguin ...	3 22 0	4 31 5	Third.
Commander ...	3 23 45	4 46 23	
Phoebe ...	3 30 0	4 25 45	First.
Sea Urchin ...	3 30 0	4 42 25	
Hebe ...	3 32 30	4 40 30	
Chrys ...	3 33 0	4 41 5	
Communicator ...	3 34 48	4 44 20	
Tramp ...	3 38 0	4 27 20	Second.
Squirt ...	3 40 0	4 32 5	Fourth.
Ki Wi ...	3 40 0	4 34 15	
Javelin } Absentees.			
Swiftsure }			

### SCOTTISH.

THE general meeting of members was held in Glasgow on Thursday of last week. Mr. Henry M. Napier, Chairman of the General Council, presided. A report by the General Council, which showed the membership to be 649 and the finances to be in a healthy condition, was submitted by the Chairman and unanimously adopted. The details of the agreements just concluded with the Automobile Club of Great Britain and Ireland and the Motor Union were approved. The Right Honourable Sir J. H. A. Macdonald, K.C.B., Lord Justice Clerk of Scotland, was re-elected President of the Club. The proposal of the General Council for the unification of the Club and its administration through one governing body and one secretarial department instead of by sections as hitherto, was submitted, and the necessary amendments to the constitution and rules consequent thereon were agreed to.

### LEICESTERSHIRE.

ON Saturday, the 15th inst., the Leicestershire Automobile Club will hold a hill climbing competition at Kettleby Hill, with Colonel L. Powell, J.P., and Mr. E. G. Mawbey as judges. It will be open to members of the seven midland clubs, and the entries must be made on forms obtained from the secretary of the Leicestershire Automobile Club, Mr. Alan McAlpin, Cank Street, Leicester, who will receive them up to noon on Monday, September 10th. Kettleby Hill is on the main road from Nottingham to Melton Mowbray, and the starting point is just beyond the 14th milestone from Nottingham, and is 110 miles from London. Melton Mowbray is four miles from the hill. The length of the course is one kilometre, and the difference in altitude 265'42 ft.

THE King of Spain has become an honorary member of the Aero Club of the United Kingdom.

THE Manchester Motor Club is having a hill-climbing competition for cars to-day (Saturday) up Snake Hill, Glossop.

A SPECIAL meet of the Lincolnshire Automobile Club has been arranged for at Woodland Spa on Wednesday next, the 12th inst.

### ROAD REPORTS.

WITHAM.—The Surveyor to the Witham District Council has reported that he had obtained about four tons of calcium chloride, and had laid down about two tons on the length of road between the Roman Catholic Church and the Bridge School, a distance of about six furlongs. The result had been satisfactory so far, and was much appreciated by the townspeople, but he did not think in that district it came up to what was claimed for it, namely, that it would only want putting down four times a year. He found it necessary to water the road once a day, or at one-third of the usual cost of watering, but against this there was the extra cost of the calcium chloride.

"DUSTOID" AT COLWYN BAY.—Mr. W. Jones, the surveyor to the Colwyn Bay District Council, has been experimenting with "Dustoid," which is made at the works of Messrs. Kneeshaw Lupton and Co., Llandudlas. A length of the main road in front of the offices was selected, and the first portion taken in hand extended from Coed Pella Road to Queen's Drive. The road was first thoroughly swept and the dust all picked up; the composition, costing 45s. a ton, was then heated in a boiler and applied on the road hot and well brushed in, and after allowing it to stand for a short time so as to secure its soaking into the metal, fine limestone grit was sprinkled over the surface to prevent the composition sticking to the wheels of vehicles, &c., passing over the same. After this length had been finished the process was continued up to the North and South Wales Bank, but instead of using grit Mr. Jones used limestone dust to dry up the surface. This experiment did not improve the process, and fine grit is the best medium to use for drying the surface. The shopkeepers along this length of the road speak favourably of the benefit derived. The cost of this work has been as follows:—Wages £4 6s. 7d., cartage £1 1s., dustoid £5, grit and dust £3 12s. 4d.: total £13 19s. 11d. The extent of road surface treated here is 2,250 square yards, which works out as nearly as possible at 1½d. per square yard. The length from Lawson Road to Meirion Gardens

was then treated in like manner, but limestone grit was used instead of dust. The extent of surface here was nearly 1,000 square yards, and the cost again worked out at about 1½d. per square yard. It is, in the opinion of the surveyor, a perfect remedy for the dust nuisance, and if the main road throughout was treated with this material it would prove a great saving even in the cost of scavenging and watering, without counting anything for the absence of dust, the deadening of noise of the traffic, the preserving of the road surface, and the absence of mud in wet weather.

LYMINITE is the latest dust palliative. It has been introduced by Mr. Carpenter, who is with Mr. R. Barclay, of West Hamble, and consists of nitrate of soda, sodium chloride, and lime, the latter being present in the largest quantity. The new preparation is being tested on a piece of the London-Dorking road near the Burford Bridge Hotel, and the experience of motorists who travel over the prepared stretch of 100 yards should be useful.

WINCHESTER.—Col. H. Stratton Bates, J.P., of Alresford, has confirmed the view of the local authorities of Winchester as to the unsuitability of Worthy Lane for motor-car traffic. The Corporation is seeking powers to close it—action which the gallant colonel endorses on account of its unworthy narrowness.

### THE WINNER OF THE GRAND PRIX RACE.

Szisz!  
No auto swift as his is!  
It whizzes,  
And fizzes,  
And, eye outrunning, dizzies.  
Szisz!  
In the "papes" his phiz is,  
He knows what his biz is!  
Boom, ah—Szisz!—*N. Y. Sun.*

### PUBLIC MOTOR SERVICES.

*We shall be pleased to receive the published time tables, list of fares, etc., of Public Motor Services for notice in this column.*

THE motor-omnibus, which for the past twelve months has been running between Haywards Heath, Lindfield, and Cuckfield, has suspended its public services between the towns mentioned. The company has found that while the summer traffic has been remunerative, the patronage of the bus in the winter months has not warranted the keeping up of the winter service. The bus, however, has not stopped running. It is much sought after for private excursions, and it is anticipated that private work and special trips when public events occur will prove financially better than maintaining a daily service on routes with a public not fully appreciating the facilities offered.

SIR JOHN POUND, presiding at the meeting of the London General Omnibus Company, said there was a reduction of £25,000 in the receipts. Owing to motors being undelivered they had seventeen fewer omnibuses and motors running, but they had carried 108,341,000 passengers, or an increase of 507 per vehicle. There would have been little difference but for the average fare being one twentieth of a penny less, which accounted for a reduction in receipts of over £23,000. Passengers for short distances preferred horse omnibuses, and long-distance passengers took the motors, consequently they had had most of the short riders. The expenses showed a reduction of £1,403. The extra costs on the road were in fuel and lubricants £4,738, wages £1,100, and excise licences £187. The last item was an exorbitant tax on motor-omnibuses, being five times as much as on horse omnibuses. Reduction in yard expenses was occasioned by the decreased number of horsekeepers, owing to the smaller number of horses. And for the same reason the cost of provender, bedding, and shoeing was reduced by about £2,500. The value of motors had been written down on the basis that the chassis and mechanical parts would last little over three years. On June 30th they possessed ninety-two motor vehicles, and now they had 135, and contracts for several hundred more. They were paying all attention to complaints about noise, which would no doubt be remedied. The solution of such problems took time, and it would be matter for regret if the motor-omnibus industry was hampered and restrictions placed on what would be the most popular, speedy, and efficient means of transport in the Metropolis.

At the statutory meeting of the London Electrobuses Company (Ltd.), the chairman (Mr. J. T. Musgrave) stated that satisfactory progress was being made towards placing a line of electric buses on the streets. Notwithstanding the large number of withdrawals, there still remained on the books of the company nearly 50,000 shares, in respect of which only £170 was owing for calls made. Thirty vehicles were on order, ten of which were being pushed forward rapidly. Satisfactory contracts had been entered into for tyres and accumulators, and they already had a suitable garage.

At a meeting of the Edmonton District Council, a petition said to have been signed by 12,000 of the inhabitants was presented, urging the Council to purchase twelve or sixteen motor-omnibuses in order to afford riding facilities between Edmonton and the districts of Waltham Cross, Chingford, and Wood Green. It was unanimously decided not to entertain the idea, the arguments used against the suggestion being that this was a matter for private enterprise, and that the running of motor-

omnibuses in the district was not desirable, owing to the smell and dust they create.

ON Monday there was a discussion at the Eastbourne Town Council with regard to tramcars v. motor-buses. One speaker declared that there had been a loss of £700 on the motor-buses, but a resolution asking for a town's meeting to consider the provision of electric tramcars was lost by nineteen votes to six.

### CASES AGAINST MOTORISTS.

AT Kingston, Henry Moon, a chauffeur, of York Street, London, W., was summoned for driving a motor-car at a greater speed than twenty miles an hour, at Walton, on August 4th. Police-constables who timed the car gave the speed as thirty miles an hour. Defendant called his employer, Mr. Henry Edward Strakosch, who said he was the owner of the car, and at no time did it go at more than twenty miles an hour. Superintendent Marks (Surrey Constabulary).—Have you ever been convicted of going faster? Witness.—I may have been. Count Gustav Lizzo Noris, Austro-Hungarian Vice-Consul in England, who was also in the car, gave similar evidence as to speed, but the chairman said the Bench saw no reason to doubt the evidence of the police, and a fine of £2 and 17s. 6d. costs would be imposed.

A SEQUEL to a charge of dangerous driving preferred against Frederick Leonard Grey, King's Heath House, King's Heath, at the Birmingham Police Court, on July 6th, has been heard since, when he

An Early Morning Spin in Fairmount Park, Philadelphia.

was charged with attempting to bribe Police-constable Allen whilst in the execution of his duty. Defendant reserved his defence, and was committed to the Quarter Sessions on bail in his own recognisances.

BEFORE Mr. Marsham, at Bow Street Police Court, Frederick Charles Jackson was summoned for driving an unregistered motor-car, and also for not having a distinguishing number affixed to the manufacturers' identification plate; and Wm. Finch, engineer, to the Associated Omnibus Company, was summoned for aiding and abetting him. Both the defendants pleaded guilty. A representative of Messrs. Wopner, who prosecuted for the Commissioner of Police, explained that on the morning of July 30th Jackson was seen driving a motor-lorry in Russell Square. It had on it the letters A. G. O., which was the manufacturers' identification plate assigned to the Associated Omnibus Company, but there were no numbers as there should have been. It was afterwards ascertained that the lorry had not been registered, and when Mr. Finch was seen on the subject he said "I really know very little about it. It is news to me that we could not use the lorry." The defendant Finch now stated that he was under the impression that the letters A. G. O. were sufficient. The magistrate, remarking that the defendant appeared to have acted in ignorance, ordered Finch to pay fines and costs amounting to £6 6s., while Jackson was fined 10s. and 4s. costs.

AT the Lexden and Winstree (Essex) Petty Sessions on Saturday John Wingrove Lauri was summoned for not stopping his motor-car when signalled to do so, and also for driving dangerously. Dr. C. J.

Worts, of Fordham, said when the car approached his trap he put out his hand as a warning to defendant, who, however, kept on, with the result that there was a collision, and witness was knocked into a ditch and severely injured. Defendant pleaded that something went wrong with the back brake. He was fined £5 and costs for not stopping, and the second charge was dismissed.

FRANCIS SUTCLIFFE has been fined 40s. and costs for recklessly driving a motor-car at Filey. Lord and Lady Auckland were the witnesses for the prosecution.

A BATCH of motor-car cases was heard at the Shoreham Petty Sessions on Monday. William Crier pleaded not guilty to a summons for not stopping his motor-car at the request of P.C. Brett at Southwick. P.C. Brett stated that he signalled to the driver to stop, while forty or fifty yards away, thinking that he was travelling at an excessive speed, but defendant took no notice, and witness had to step out of his way. For the defence Mr. Gates said his client neither saw nor heard the signal to stop. On the other hand, his wife, who was at the back, saw the signal, but she did not tell her husband until he got home to Bungalow Town. Defendant was fined £1 16s. costs, and £1, expenses of four witnesses. Cases against John Francis Hallick, Lambourn, Berkshire, for not producing a motor-driver's licence at the request of P.C. Knight, and also for not having the rear identification plate illuminated at Shoreham on August 2nd, and a summons against John Edward Rooney, Kilburn, for not having his rear plate illuminated at Southwick later in the same evening, were dismissed, as the constables concerned in the cases intimated that the defendants were not the men who were driving when they stopped them, and who gave the above names and addresses. Alexander Swan, Waldegrave Road, Brighton, denied exceeding the speed limit at Shoreham, on the evening of August 26th, and Mr. J. K. Nye (Brighton) defended him. P.C. Marsh put defendant's speed at about 26½ miles an hour. Swan, he said, remarked, "Your watch is all wrong," and, pointing to a speedometer on his car, added, "I've got this." It was not a "registering" but an "indicating" speedometer. P.C.'s Weller and Rider gave evidence, and Mr. W. Long, watchmaker, of 57, North Street, Portslade, deposed to testing the stop-watch and finding it correct. The Bench imposed a penalty of £1 10s., 13s. costs, and 5s. watchmaker's fee. A point in the favour of the defendant, the Chairman intimated, was that he carried a speedometer. If all drivers would do this it would tend to prevent excessive speed. Some day, he hoped, they would be able to get not only a speedometer which indicated, but one which registered.

### MOTOR 'BUS v. TRAM CAR.

At the Bristol Police Court, a summons for recklessly and improperly driving a motor-'bus in White Ladies Road has been heard against Charles Coles, a motor-'bus driver in the employ of the Bristol Tramways Company. Mr. Wansbrough, for the defence, said there were two summonses against the defendant, the first for driving the car in an improper manner, which in this case meant being on the wrong side of the road, and a second summons, under the Motor Car Act, for driving the car at an excessive speed. Dealing with the first summons, he supposed the magistrates were aware there was a rule of the road that when a vehicle was overtaken, that vehicle should be passed upon the right. Under the Act of Parliament, when a motor-'bus was passing a tramcar proceeding in the same direction, the 'bus should be kept to the right side of the road. Clearly, in the present case, even if there had been no such rule, the driver had done perfectly right, because people were getting on to the tramcar, which had stopped, and to have taken the car on the left side of the road would have placed those people in peril. In such a case the driver did unquestionably right in drawing on to the right side of the road. Now, it was suggested that the driver in passing the car should have immediately crossed back on to his proper side, and the fact that he did not do so formed the charge against him. The police officer had further suggested that the tramcar—in which there were passengers, and which had stopped at Apsley Road, and was going to stop at Ashgrove Road—was actually racing with the motor-'bus. He was standing some 270 yards away, and yet held that between these roads the two vehicles were racing. He (Mr. Wansbrough) maintained that to be quite untrue. The tramcar was proceeding at a normal pace, and the 'bus was travelling at the same speed behind it. They therefore began with the fact that both vehicles were travelling at an ordinary normal rate of speed. There was absolutely no reason that the 'bus should stop when the tramcar did, and it was the plain duty of the driver of the 'bus to draw out on to the right side of the road. If there had been any vehicular traffic in the way, of course he would have had to stop immediately, but the road was quite free from traffic. It was also a wet night, and, as they had heard from witnesses brought by the prosecution, there was a danger of a side-slip if the 'bus was taken back to its proper side after passing the car. It must also be remembered that that danger was added to considerably by the fact that a motor-'bus is a heavy vehicle, and it would have been taking a grave risk by turning suddenly.

Mr. Ford, in giving the magistrates' decision, said they would dismiss the charge of reckless driving, but they thought that, as regarded the improper driving, there was no occasion for the defendant going out from behind the car. He had no reason on earth for doing so, for he ought to have slowed down behind the tram.

Mr. Wansbrough broke in at this point, and reminded the Bench that

the law said a vehicle overtaking another "must pass on the right side," if it passed at all.

Mr. Ford said they thought that there was no necessity for pulling out at all as the driver had done, but asked the assistant magistrates' clerk (Mr. Braithwaite) how the law stood in the matter.

Mr. Braithwaite said that the law entitled a driver to pass another vehicle on overtaking it, providing that he went on the right hand side of it and proceeded with reasonable and proper precaution, returning to the left-hand side of the road as soon as possible. The question they had to decide was whether the defendant went round the car in a proper manner and returned to the proper side of the road as soon as possible and safe.

The magistrates, in view of this advice, altered their previous intention to fine defendant 10s. and costs, and also dismissed the second case.

### POLICE TRAPS.

GREEN STREET GREEN, on the Sevenoaks Road, has been the scene of a police trap of late.

THE painting of the word T R A P in some conspicuous positions on a certain Kentish road as a warning to motorists is reported to have led to so much multiplication of the word as to cause confusion to all who drive that way.

THERE is a dangerous piece of road between Totnes and Newton Abbot, five miles from Totnes, where the police patrol with watchful eyes for motorists.

THE trap at Alconbury Weston is again in full working order.

SHOREHAM and the roads round about has again come into prominence as a scene of police traps.

### MOTOR-CAR ACCIDENTS.

A MOTOR-CAR owned by Mr. Allen Spring, of London, knocked down and seriously injured a boy named James Murphy in Dublin.

A FIVE-YEAR-OLD girl named Wilson was killed in Sheffield by a motor-car. At the inquest yesterday the driver swore that he was not travelling more than five miles an hour. Medical evidence showed that both the child's legs were broken and her head injured. A verdict of "Accidental death" was returned, and the driver was exonerated from blame.

As Dr. and Mrs. Donellan were motoring into Battle their car collided with an automobile owned by Mr. Dengate. Mrs. Donellan was thrown out, sustaining a broken arm and slight concussion of the brain. Mr. Dengate's car was badly smashed. Mrs. Donellan was conveyed by the Dean of Battle, who was passing in his carriage, to Battle, where her injuries were attended to. This made the fifth motor accident in the neighbourhood last week.

ALIGHTING from a tramcar in Dublin last week an actor named Harry Eversleigh was knocked down by a motor-car and killed instantly. He was a member of Mr. Seymour Hicks's "Catch of the Season" company, at present performing in the Theatre Royal, Dublin. The car was occupied by Mrs. Brooks, a relative of Earl Fitzwilliam.

NOAH HALL, the chauffeur who was driving the motor-car which fatally injured Mr. Harry Eversleigh, of Mr. Seymour Hicks's company, has been returned for trial at Dublin.

At the adjourned inquest on the 30th ult. at Leeds in the case of John Thomas Ring, who was killed in a motor-car accident, when five other persons were injured, expert and other evidence was called. The witnesses agreed that the car at the time of the accident was going at a great speed. The inquiry was further adjourned for a week, when the evidence of one of the injured persons in the infirmary is to be taken.

IN Lea Bridge Road, Leyton, William Goodear, a schoolboy, was knocked down and killed by a motor-car. He was crossing the road and had evaded a motor-omnibus, but was caught by a motor-car passing at the same time.

### TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 27-33, Charing Cross Road, London, W.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

To insure insertion communications and contributions must be in the Editors' hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

## COMMENTS.

**M**R. HALDANE'S scheme of Army Reform includes further developments in connection with mechanical transport, which commend themselves to a frugal War Minister on the score of economy as well as efficiency. Both at Chatham and Aldershot great things have lately been done in connection with the elimination of horse transport in certain departments,

and already the Army Service Corps has machines of transport worth about £150,000, including seventeen traction engines, ten steam motor lorries, eight lorries with oil fuel, and a motor ambulance. Mr. H. W. Nevinson calculates that as compared with the hire of horses to do the work of which these were capable £7,438 was saved to the country in the six months ending March 31st last. Attached to the motor vehicle depot is a field repair train, and all things tend in the direction of the abolition of horse transport from the Army. The officers in the Army Service Corps have now to go through a course of motor mechanics. In addition to this transport equipment the War Office has twenty-one motor-cars of its own, but, as the largest of these is only of 15-h.p., the favour with which the Generals regard the Army Motor Reserve is easily apparent.

### The Car and the Camera.

THE fact that many motorists carry cameras gives added interest to our Competition for photographs of scenes in which the car figures. The automobile has been responsible for a great accession to the ranks of the amateur

photographers, and has encouraged folks to tour in their own as well as other lands, thus adding to the opportunities for securing impressions worthy of retention. And the camera affords a ready and effective means of securing such reminiscences. In time the history of automobilism will owe much to photography, through the agency of which we are able to secure permanent records of its progress and advancement.

### Lights on Vehicles.

MUCH progress has been made during recent years in the direction of ensuring that vehicles using the public thoroughfares should be properly lighted. Still, according to a Parliamentary return just issued, there is anything but uniformity in the provisions adopted by local authorities. In April, 1900, the Home Office, on the principle that owners of vehicles should be made responsible for providing the lamps, and that drivers should be held responsible for keeping them lighted, issued a model form as a basis for local by-laws, which was further strengthened in 1902. These were sufficiently comprehensive, including both front and rear lights on ordinary vehicles and timber-laden drays. The return shows that 60 county authorities and 151 boroughs have adopted the model with only unimportant variations. In the case of forty-five county authorities and ninety-four boroughs

either old bye-laws still exist or new ones have been adopted with variations in substance from the model. A third table reveals that one county (Merionethshire) and eighty boroughs have not yet made any bye-laws on the subject. Strangely enough, London's bye-laws vary from the model in the important fact that there is no provision requiring wagons with projecting loads to show a red light to the rear. Middlesex, Surrey, Kent, and East and West Sussex appear among the county authorities who have adopted the model. The improvement in providing for the safety of the public roads during recent years is shown generally in the statement that when the last return was issued, in 1897, only twenty-nine county councils and twenty-one borough councils had any such bye-laws. At present some form of regulation is in force in all the counties except one, and in 245 out of a total of 325 boroughs.

### Motor-Car Imports and Exports.

THE trade in foreign-built cars in this country continues to show a steady increase. According to the returns now available no less than 614 cars, valued at £261,204, were imported during last month; parts were responsible for a further sum of £136,906, giving a combined total of £398,110, which compares with only £326,602 in August, 1905. As regards the imports during the first eight months of the current year, these have amounted to 4,413 cars, worth £1,823,087, and parts to the extent of £1,301,918, the aggregate of £3,125,005 contrasting with only £2,441,282 in the first eight months of last year, or an increase of roundly £683,000. Turning now to the exports of British motor-cars and parts, these, during August, amounted to £62,521, an increase of £18,353. For the first eight months of 1906 the shipments comprised 675 cars, valued at £240,420, and parts estimated at £180,340, the total of £420,760 representing an increase of £180,813.

### Children on the Roads.

OFTEN have we referred to the folly of allowing the public road to be used as a playground for children; but unfortunately, even in some country districts, there is little else where the youngsters may play without hindrance. Mrs. Carl Meyer, a lady with a keen enthusiasm for motoring, recognising that the children of Newport, in Essex, near which hamlet she lives, have no facilities for play except in the village street, has thrown open her park and invited them there. This is certainly a means of dealing with one of the phases of the motor-car movement, and should do much to banish public prejudice with regard to the automobile in the rural districts—provided the children will leave the favourite roadway for the secluded park.

### A September Review.

SOME characteristics of motorists are set forth in an article by "Cygnus," in the "Fortnightly Review," on "Motor Cars in the Present and Future." These virtues, though familiar enough to our readers, will apparently be regarded as new notions by many who motor not. It is confessed that when roads are clear and straight, and police and public equally out of sight, there is sometimes a tendency on the part of drivers to whirl along merrily, heedless of the legal limitation of speed.

But "at corners, or passing through villages or hamlets, on the other hand, their care is meticulous." One interesting statement made "only by way of parenthesis" refers to the development of the electric car, in which we are told that "signs of a possible metamorphosis in the near future are not entirely wanting." Should any great improvement in accumulators take place "the petrol-driven car will become as obsolete as the pack-horse." But no danger need be apprehended on that account, and even Edison himself seems to have recognised the value of other than electric cars for long tours apart from short trips in town.

### The Poona Trial.

THE great Poona motor trials took place at the end of August with thirty competitors, many of whose performances were noteworthy. The event took place from Poona to Satora and return, a total distance of 145 miles. The trial included a seven miles hill climb over the Ghauts, for which the Nawab

taken in the subject, not only by inventors but also by the local authorities, whose co-operation should be sought.

### The Waning Season.

THIS is, practically, the last month of the automobile open air season of 1906, and although the weather has occasionally been "too warm for anything," motorists have had a run of fine days and delightful week-ends. Last Saturday the Auto-Cycle Club's competition at Birdlip Hill, the race meeting at Skegness, and the Scottish gathering at Peebles, illustrated how widely diffused is the interest in the organisation of automobilism. To-day (Saturday) the southern clubs—Essex, West Essex, West Surrey, Hertfordshire, North Herts, Kent and Kensington—are busily and socially engaged, while the reunion of motor-cyclists at Warwick should bring together a goodly company. Although the great meeting at Scarborough on the 22nd inst. will dwarf all other events into the minor category, motor-cyclists will find attractions in the annual race meeting at

Motor-Car Trials in India.—Weighing-in for the Aga Khan Competition.

of Sachin offered a trophy. This was won by the Maharajah of Scindia's 24-h.p. Wolseley, driven by Lieutenant Jenkins. The winner of the Ladies' Trophy drove a Wolseley, as did also Mrs. Cama, the only lady driver in the competition. She is the first of her sex to take part in such a trial in the Dependency, and her entry naturally attracted much notice throughout India. The chief prize in the competition was won by Lieutenant Rose on a 10-h.p. Renault, which gained 4,175 marks in the competition.

### The Distribution of Tar.

THE arrangements in connection with the competition for the best mechanical appliance for the distribution of tar on the roads, which the Motor Union, at their meeting at Bath, decided to hold, are not yet completed. They are, however, proceeding well, and we hope shortly to be able to publish the regulations governing the matter. Much interest is being

Canning Town; west country motorists in the Bristol and Gloucestershire A.C.'s picnic in Saverne Forest; and the inter-club meet of the local Wolverhampton and Lincolnshire clubs will draw many motorists to Leicester. And then, when the open air season is ended, there will be a busy winter of discussion and conference preparatory to the new legislation.

### The Proposed Taxation.

THE taxation of cars according to the proposals of the Royal Commission is a subject of importance to the trade as well as to the public, for the former will find the latter less inclined to commit themselves to the expense of cars. We have received the copy of a letter sent to a manufacturing firm, in which the writer says:—"I was on the point of starting to try your car when I opened a newspaper and read what is there stated as to the rumoured action of the Government in taxing cars £1 per h.p., with a minimum of £5 for the

lowest powered self-propelled vehicle. I must therefore postpone getting a new car until this matter is settled—indeed, if such a tax is imposed, I shall lock my car up and pay nothing until better times.” This question of taxation is hanging over the trade very unpleasantly, and the sooner the Government make known their intentions with regard to the Report of the Royal Commission the better will it be for both the trade and the public. There is a real danger that sufficient distinction may not be made as to the rates chargeable on small and large cars. The scale as at present graduated in the proposals of the Commission starts too high, and if adopted would undoubtedly prove a hardship on the man of moderate means, as well as upon those owners who possess several vehicles. Nothing must be perpetuated in the law which is calculated to, or has the effect of, restricting the natural development of an industry whose success means much for the national prosperity.

with regulating the routes, as at Brighton, and some with revising the fares, as at Southport; but, on the whole, a wise toleration has been the rule, and not even the Handcross accident caused licensing authorities to respond to the call for a panic which some of the London journals sought to create at the time.

#### Care Essential.

BUT, although the authorities have thus shown an appreciation of the newness of the situation brought about by the sudden advance of the hired motor-car, they are not likely to be ever-indulgent. As a matter of fact, we are able to warn those of our readers interested in the development of public motor services that careful note is being made in many places of the complaints and accidents—or incidents magnified into mishaps—associated with the services, with the view to

The Austrian Military Road Trains leaving Vienna for the Manœuvres.

[Allgemeine Automobil Zeitung.]

#### The Motor-Car at Holiday Resorts.

RIGHT round the coast and in every centre of tourist resort the motor vehicle has become a recognised means of public conveyance. Holiday makers have not been scared by the few accidents that have occurred, recognising that the risks of motor-cars are not greater than those of other forms of travel. They appreciate its speed, realising that quick travel really lengthens the holiday by permitting more places to be seen than was possible when the “one-hoss shay” or the double-horsed brake held a recognised monopoly of locomotion at the seaside. Hence the value of the automobile to the holiday-maker is as real and tangible as it is to the man hastening to business or home. With the exception of Southend and one or two other towns where local interests seemed likely to be dispossessed by the motor vehicle plying for hire, English governing authorities have taken a liberal view of the matter, and hampering restrictions have not been general. Most have been satisfied

proposing regulations of a more or less stringent character in future seasons. Because certain latitude has been given in 1906 it must not be supposed that this will always be the case. Upon the order of the running, the precautions taken in the public interest at the garages, and the general condition of the service, will depend the ease of renewal of licences, while mechanical matters will, of course, enter into the question of granting such permissions to ply.

#### Cost of Road Signals.

THE provision of motor-car road signals entails considerable expenditure on local authorities, and the experience of the County Council of Kent is probably true of all such authorities. For the year just closed that council expended £692 on direction posts and motor-car signals, two-thirds of which was spent in the purchase and erection of the latter. This is an entirely new charge on the Surveyor's department, and appli-

cations continue, he reports, to be made for additional signs, the average cost of which is 13s. 6d., besides maintenance. The number of vehicles registered in the county as motor-cars numbered 2,456 in the twelvemonth, an increase of 1,151 on the previous year, but a very large number of light cars, the property of residents in the county, are registered with the London County Council, the fees, of course, going with the registration. Still it is clear that the increased revenue of the county from motor-car taxation has provided not only compensation, but also a profit on such signs.

#### The Ryknield Motor-Bus.

On Tuesday last the Ryknield Motor Company, Ltd., gave a demonstration of the braking capacity of their new 40-h.p. motor-bus, both on the level and on hills. A large party left the Hotel Metropole, Northumberland Avenue, S.W., for a run to Richmond, and the ease of manipulation, the rapidity of picking up speeds, and the power of the brakes created a most favourable impression. After lunch the hill-climbing capabilities of the 'bus were fully demonstrated. On

Mr. Frank Hedges Butler, one of the competitors for the Gordon Bennett Balloon Race from Paris on the 30th inst. Mr. Butler—the founder of the Aero Club—has made eighty free balloon ascents in this country and in France, and has crossed the Channel on two occasions.

the ascent of Richmond Hill the vehicle was brought to a stand and re-started without difficulty, while the capacity of the brakes was shown during the descent of Petersham Hill. Afterwards the 'bus was successfully driven up the test hill in Richmond Park, where its appearance caused consternation amongst the keepers, and the journey back to town safely completed. The Ryknield 'bus is built throughout at the company's works at Burton-on-Trent, and in its design and construction special attention has been paid, not only to the brakes, but to reducing the noise and to the elimination of any noxious smoke. The latter object is attained by means of a positive lubricating system, by which the oil is pumped to the engine bearings without resorting to the "splash" method of lubrication. Attention may also be drawn to the Ryknield patent triangular underframe and spring drive, which keeps the driving pinions in strict alignment with the gear rings on the road wheels and saves the driving gear from all strains due to bad roads, so eliminating the noise caused by worn gears. Another feature deserving of notice is the emergency brake, arranged to be operated by the conductor. This takes the form of a screw-

down brake acting directly on the road wheels, and worked by a hand wheel on the rear platform.

#### Keep to the Kerb.

PERFECTION not yet having been obtained by the motor-buses of London, they sometimes give the impression of sulkiness even in the most crowded thoroughfares. Then the driver and conductor have a little cogitation, and ultimately it dawns upon the upper deck passengers that their craft has become becalmed—to adopt a mixed metaphor. The motor-bus remains stationary till the relief brigade arrives on the scene. What we complain of, and what some users of the road hurl expletives at, is the habit that prevails of allowing the vehicle to thus remain a few feet from the kerb, and so become a means of incommoding other traffic. Common sense, if not the police, should suggest that stranded vehicles should be pushed as close to the kerb as possible, so that they shall not constitute a nuisance to those that wish to make use of the roadway. The point may appear a small one; it, however, is one of those that contribute to the comfort and convenience of the public.

#### The Blowing of the Horn.

THE Surrey County Council's notice against the blowing of "horns and musical instruments," which has been extensively circulated throughout its area, has been regarded by some of our contemporaries as being directed against the horn on motor-cars. We believe the injunction was really directed against the discordant sounds emitted from the instruments carried by beanfeasters and others, and had no primal association with the automobile. At the same time there is need for a warning with regard to the use of the horn by motorists, who should regard it as only applicable in special circumstances, and not to be used on every occasion. In this connection the use of the horn by cyclists is to be deprecated, there being much in favour of the distinction by sound. Just as the bell has become the note of the cycle, so the horn might be allowed to become the monopoly of the motor-car.

### M.C.J. PRIZE COMPETITIONS.

#### FOR MOTORING EXPERIENCES.

THE proprietors of the *M.C.J.* offer three prizes—one of a guinea and two of half-a-guinea each—for the most humorous motoring experience, limited to 100 words, and to be written on a postcard. It must be concisely worded, and should be a record of something that has actually happened. The last day for receiving competitions is to-day (Saturday) September 15th. All entries must be sent to the *M.C.J.* Office, 27-33, Charing Cross Road, W.C., and the Editor's decision will be final. A selection of the unsuccessful experiences will be given in the same issue as that in which the awards are announced.

Postcards received by any post during September 15th will be eligible for the competition.

#### AUTOMOBILE PHOTOGRAPHS.

Three prizes are also offered—one of a guinea and two of half a guinea—for the best photograph in which a motor-car figures. In making the award regard will be paid to the public interest of the picture, as well as to its artistic merits; hence, photographs of cars outside historic buildings or monuments will be as welcome as those of vehicles in pleasant places.

Only original photographs may be submitted, the copyright of which belongs to the competitor. The winning photographs will be published in the *M.C.J.*, and the Editor reserves the right to reproduce, without payment, a selection of those not successful in the competition. The latest date for receiving photographs will be Saturday, the 29th inst. Envelopes must be marked "Competition" in the top left-hand corner.

## UNDER THE BRECON BEACONS AND THROUGH MID-WALES.

BY JOHN LL. WARDEN-PAGE.

(Concluded from page 580.)

**T**HERE are two routes from Rhayader to Aberystwyth. The first, now known as the old road, is a fearsome highway, covered with loose stones, grass grown, intersected by fords and full of abrupt ascents and descents. In the first four miles, for instance, it rises a thousand feet; drops five hundred in the next mile and a half—and so on. Wherefore it is not to be recommended to the motorist. The other road is, for a mountain road, very fair, and severe gradients are few. Still following the Wye, it leaves Rhayader by a pleasant tree-shaded road and then plunges abruptly into the mountains. Two miles from the town we sweep round a corner into a grand view. Hills bold and lofty drop steep on either hand. Down a mountain side to the left pours a long, narrow cataract. Turning another corner scenery even finer is encountered. The Wye

there is none other till we reach the foot of the descent on the other side. This is the Glan Severn Arms, which reminds us that we are approaching the source of the Severn as well as that of the Wye, both rivers rising in Plynlimmon. Near it is the last patch of timber. Beyond the inn the scenery resolves itself into huge green hills without so much as a bush to relieve their nakedness. A little beyond we cross the Wye, now a mere trickle among the boulders, for the last time, for we are within a mile or two of its fountain head, and the foothills of Plynlimmon close the valley in front, though the mountain itself is invisible. And now the summit of the pass comes into view—Steddfa Gurig. The name means St. Curig's seat. It must have been a very draughty one, for it lies in a narrow opening, 1,358 feet above the sea. From the handful of cottages that now occupy the saint's airy abode, the road at once begins to descend westward. It is a pity the surface is not better; there is too much loose slate about. Still, with the exception of the first bit, which is very stony, there is a grand run down. But care is required. Here and there the road, cut in the mountain side, curves sharply round

[Tyde, Aberystwyth.

comes swiftly down a deep glen, narrow and wooded, shut in by rocky slopes. Up the side of this glen the road climbs steadily for three miles; afterwards, following a more switchback course, it passes through a widening valley to Llangurig.

Llangurig is a village in the wilds—the last for many miles. It is set in a sort of amphitheatre of bare, grassy mountains, and lies over nine hundred feet above the sea. There is hardly a tree to be seen. Indeed, for the next ten miles timber is conspicuous by its absence. It is, I think, the barest piece of country in Wales. Yet the village is pretty, with a pleasant inn, and boasts a church of some interest, restored at great cost by a local magnate, who himself designed the windows, which illustrate scenes in the ecclesiastical history of the Principality.

The road still rises. But it swings round the mountain spurs in quite easy gradients, and in the remaining eight miles to the summit of the pass only rises some four hundred feet. In places the surface is somewhat loose, especially after long drought, but on the whole it is kept very fairly. One lonely inn is passed, where, perhaps, it will be well to halt, for

the spurs. There are sheep, too, to be considered; and, as there are no fences, they may be encountered at any moment. Many a good descent have they spoilt for us in times past.

At the Dyffryn Castle Hotel, at the foot of this long descent, barrenness comes to an end and there are a few trees; likewise a mine or two, which do not improve the scenery. And now we keep the car well in hand, for, just below, the road forks, one branch going to Aberystwyth along the northern, the other following the southern side of the river Rheidol via the far-famed Devil's Bridge. We, of course, take the latter, though the selection involves an immediate plunge into a tributary stream under which the road dips. The water, however, is not very deep, and the stream may be avoided altogether by the motor-cyclist, for close by is a footbridge. From this ford the road, a little rough at first, ascends sharply—in short, there are several abrupt rises and falls to the Devil's Bridge, six miles away. At the top of the hill we find ourselves above the deep-wooded gorge of the Rheidol, and it will be well to stop to admire it, free from the cares of steering wheel and

brake, for the descent is one in two. A closer acquaintance with the beauties of the gorge may be made by leaving the car just off the roadside by Yspytty Cynfyn church. From the latter a footpath winds through a field or two to the edge of the glen, down which a zigzag drops through the woods to the Parson's Bridge, a plank suspension spanning the ravine high above the torrent. The surroundings are beautiful beyond words. In ancient days, when the "Parson" had to cross by the aid of a single plank, he must have had a gay time of it, and we do not wonder at George Borrow, of "Lavengro" fame, crawling over it on his hands and knees "on a wet day, with a tearing, angry, swollen torrent beneath." Or, rather, we marvel that he crossed it at all. It swings pretty well even now.

We resume our seats and drive onwards to the Devil's Bridge (a very different affair to the Parson's), keeping always a wary eye for abrupt descents. The bridge comes into view somewhat suddenly, for the road as we approach it enters a thick wood. As a matter of fact there are *three* bridges, built one on the top of the other, the last being quite new. There is nothing very

[Gyde, Aberystwyth.

beautiful about either; it is the chasm which they span that makes the place so famous. There is a tremendously deep and narrow rift in the rocks, so narrow and so hung with trees that the bottom is scarcely visible. Up from the depths comes the murmur—or in winter the roar—of the Mynach rushing down to join the Rheidol over a series of precipices, one more than a hundred feet high. Mynach, by the way, is Welsh for monk, and there is a tradition that the first and lowest bridge was built by the brethren of Strata Florida Abbey because a young monk had lost his life in attempting to ford the torrent. Why, then, the Devil's Bridge? Well, we all know that when

The Devil was sick  
The Devil a monk would be,

and one writer has suggested that Satan built it when in an indifferent state of health! This is ingenious, to say the least.

The view from the hotel by the bridge I have heard described—and by no untravelled man either—as "the finest he had seen in Great Britain." We look right up the deep-wooded gorge of the Rheidol to rolling ranges of mountains, of which Plynlimmon is chief. About the centre of the picture the river falls headlong through a narrow cleft in the rocks. It is indeed a superb panorama.

The Devil's Bridge has of late years been placed in communication with Aberystwyth by means of a toy railway, the first we have seen for twenty-two miles. There are, I think, few districts in England or Wales where it is possible to travel this distance without meeting the iron horse. Nor do we see him again till we reach Aberystwyth. That salubrious watering place is but a dozen miles further west, the last ten being practically downhill. There is a bit of a climb, however, to begin with, the road rising nearly 400 feet in two miles and a half. At the highest point, just a thousand feet above sea level, we again have a grand view over the Rheidol valley, extending from the mountains to the widening *strath* through which the river winds seaward. From this summit there is a refreshing rush of three miles to begin with. But remember the sheep, especially at the top of the descent, which is moorland and fenceless. Take heed also of the last five miles, where there are gradients of 1 in 11 and 1 in 12. Soon the tall factory-chimney-like monument on Pen Dinas, wherewith the good people of Aberystwyth have seen fit to commemorate Wellington, comes into view, and the town itself appears lying across the valley mouth against a background of grey sea.

Aberystwyth (not to be guide-booky) is a pleasant enough watering place, with an old harbour, a new pier, a University College, and the remains of an ancient castle. The latter is, perhaps, the most interesting item. It stands on a rocky promontory washed on two sides by the sea and making a break in the long curve of the "front." The antiquaries differ as to whether it was or was not built by Gilbert Strongbow, Earl of Pembroke, in the reign of Henry the First. But they agree that Owen Glendwr the restless took it from the English; that the Sassenach got it back again; that Charles started a mint there, and that it fell before Cromwell. By one of Fate's little ironies it was a Welshman who took it—one Colonel Rice Powell. By him it was dismantled. And thus it came to pass that one of the race for whose subjection the castle had been built was the cause of its final overthrow.

At Aberystwyth for awhile our tour comes to an end. I say for awhile; for some day, and ere long, we may take you on the return journey through North Wales. But, as Mr. Kipling says, this is another story.
